# Index

VOLUME XXIX

OCTOBER, 1912—MARCH, 1913

The material in this index is arranged under authors and subjects and in a few cases under titles. Anonymous articles and paragraphs are entered under their subjects. The precise wording of titles has not been retained where abbreviation or paraphrase has seemed more desirable.

## A.

- Abbott, Lyman. Message of the nineteenth century to the twentieth, 336.

## THE COMMON WELFARE

### A NATIONAL CLEARING-HOUSE FOR SOCIAL SURVEYS AND EXHIBITS

How much will a survey cost our city? How can we get one started? Where can we get people to do the work? How long will it take to make it? Ever since the publication of the first reports of the Pittsburgh Survey, inquiries of this sort have been coming increasingly from cities east, west, north and south, to *THE SURVEY*, to the various departments of the Russell Sage Foundation, to the American Association of Societies for Organizing Charity and to other bodies which have not been engaged primarily in making this kind of city inventories.

The situation has seemed more and more to call for a central organization which could specialize in social surveys and to which inquiries and inquirers could be sent. Similarly, for several years past representatives of national organizations dealing with social and kindred problems have felt the need of a central clearing-house for inquiries relating to social and civic exhibits. City surveys and investigations along specific lines have been bringing forward vital facts, and every such study is in itself a new demand for better avenues and methods of popularizing the information unearthed.

To meet these widespread demands, the Russell Sage Foundation has just established a Department of Surveys and Exhibits, with headquarters at 31 Union Square, New York.

The starting of this new social agency, however, means more than the mere centralizing of inquiries. Back of that it is a recognition of important changes in human relationships, due to tremendous industrial development, the city-

ward movement, immigration, the influx of women in industry and other causes. With these changes have come new problems calling for new diagnosis and study to learn whether the old machinery for individual and social advance is fitting the new needs,—whether the community has been keeping abreast of scientific progress. We have been experimenting with instruments to get at, register and interpret the situation, and the starting of this national bureau may be regarded as recognizing (in a new and larger way than heretofore) the survey as an organized method of social discovery and the exhibit as an agency for popular interpretation. Their usefulness has been demonstrated as means to be employed in auditing present efficiency, in securing corrective action and in constructive planning for the future.

The detailed plan of action of the department has not as yet been fully worked out. In general terms, it will be to define and spread the social survey and exhibit idea; to collect and keep within easy reference reach, through pamphlets, reports, photographs, drawings, miniatures and models, information on survey and exhibit experience that has been gained thus far, and to build up an agency for assisting communities to organize surveys and exhibits. To these ends it will give advice as to methods and materials for exhibits (costs, economies, sources, rentals) and will collate and develop new ways of representing facts so as to grip the minds of the crowds who are not impressed by statistical tables or will not translate columns of figures into terms of their own experience. To cite a simple matter, quite a bit of experience has been built up on how many lines of type the average

SHELBY M. HARRISON

man will read under an enlarged photograph. The department will not have sufficient funds for sending members of its staff into communities for long periods of time to prepare exhibits, but it will to some extent be able to send representatives for short visits to assist in planning and organizing local projects.

In the matter of surveys, it will stand ready to help local organizations make the preliminary diagnosis necessary to determine what should be the major lines of inquiry prosecuted; and will put them in touch with experienced investigators who can forward the work from the point where the diagnosis stops.

In regard both to surveys and to exhibits it is not the purpose of the department to overlap the work of existing organizations, but rather to work out standards in co-operation with them and to place itself at their service.

The department is under the direction of Shelby M. Harrison and he will be assisted by E. G. Routzahn who will give special attention to the work in exhibits. Mr. Harrison has had exceptionally broad experience in surveys. He carried on post graduate work in statistics at Harvard under Prof. William Z. Ripley who in his *Races of Europe* has perhaps done more than any one else in this country in devising methods for the graphic portrayal of social and economic facts. Mr. Harrison was recommended by Professor Ripley as the man best equipped to scheme out and supervise the draughting of the series of charts and maps of the Pittsburgh Survey which were shown at Carnegie Institute

in the fall of 1908 and were used in the published volumes. He was the statistician of the staff and made an investigation of the tax situation in Pittsburgh which proved a vital factor in the deep-seated tax reforms of last year. He was director of the Syracuse Survey of 1911, and as a member of the staff of *THE SURVEY* was in charge of the field work of the special Birmingham number (January, 1912) which for the first time made an adequate interpretation of the social and economic problem of the new southern industrial communities.

Mr. Routzahn brings to his new work the fruits of six years' experience in the exhibit campaigns of the National Tuberculosis Association conducted in more than forty cities of Canada, Mexico and the United States. He has been particularly successful in tying up his campaigns to local forces that would carry the work on after he left the communities.

A departmental committee has been organized which will be in close touch with the new work. The members of the committee are:

Mary E. Richmond, director Charity Organization Department of the Russell Sage Foundation, chairman;

Leonard P. Ayres, associate director Department of Child Hygiene, Russell Sage Foundation;

Livingston Farrand, executive secretary National Association for the Study and Prevention of Tuberculosis;

John M. Glenn, general director Russell Sage Foundation;

Paul U. Kellogg, formerly director the Pittsburgh Survey; and

Francis H. McLean, general secretary American Association of Societies for Organizing Charity.

#### A BUREAU OF MUNICIPAL AND SOCIAL SERVICE

As a response to the same demand for efficiency in community work which has just led the Russell Sage Foundation to create a Bureau of Social Surveys, the People's Institute of New York has united with the Bureau of Social Research of New England in establishing a National Bureau of Municipal and Social Service. The office of the new national bureau will be at 50 Madison avenue, New York. A branch office will be maintained in Providence.

The purpose of the bureau is stated as follows:

(1) The study of municipal and social problems and the making of social surveys by trained men under the auspices of local agencies and for the purpose of securing accurate and scientific knowledge upon which to base constructive policies of improvement, economy and efficiency and municipal service.

(2) The maintenance of a bureau to aid municipal and civic authorities to find proper experts

in such problems as taxation, sanitation, engineering, etc., and to promote a wider knowledge of the successes and achievements of cities in the whole municipal field.

(3) The establishment of a clearing-house on municipal and social affairs, and the publication from time to time of such literature as will facilitate knowledge of what is being done throughout the United States and abroad.

(4) The working out of uniform standards in municipal and social matters so as to make the efforts expended by cities where studies have been made easily comparable with results achieved elsewhere.

Under the direction of Carol Aronovici, who has been appointed director of the new organization, the New England bureau during the last two years has made a score of studies of municipal and social conditions. Some of the cities in which this work has been performed are Buffalo, Providence, Springfield, Newport and Waterbury. Mr. Aronovici, in addition to his work of conducting social surveys, has made a number of special investigations for the state department of labor in Rhode Island, the results of which have been published in the annual reports of the commissioner of labor. He has also been a member of the teaching staff of Brown University.

Frederic C. Howe, the new managing director of the People's Institute and one of the best known writers on municipal topics, and John Collier, who is especially known for his work in furthering the educational use of moving pictures, will also take part in the management of the new organization. The People's Institute, under Mr. Howe, in answer to growing demands, has consciously aimed to widen the scope of its interests which formerly centered mainly around the leisure time problem and feels that it can do so most effectively through this new bureau. Cities and towns calling for the assistance of the new bureau will pay for the work performed. New Britain, Conn., has ordered an investigation. The cost of this will be paid by the city. The investigators have been made sanitary inspectors.

#### PARLIAMENT OF HEALTH

To speak in terms of chemistry, what will be the precipitate in "our United States" of the Fifteenth International Congress of Hygiene and Demography, which has been in session in Washington? Previous congresses have not been without results in the countries in which they have met and in the world at large. They have brought about improved methods of public hygiene and have spread information concerning health. Thus the third congress, meeting in Paris in 1878, was followed by sanitary re-

forms, conspicuously in Paris itself.<sup>1</sup> The death rate of Italian cities began to decline soon after the fourth congress, at Turin, which marked the beginning of municipal hygiene in Italy. The Federal Bureau of Health of Switzerland owes its foundation to the fifth meeting at Geneva in 1882. The seventh congress, held at Vienna in 1887, led to the demolition of Vienna's overcrowded tenements, the construction of healthful dwellings, the introduction of a pure water supply, and eventually to the complete transformation of the city. The era of legislation for the health of wage-earners, in which England still holds leadership, is said to date from the ninth gathering of this body in London in 1891.

The launching of special reforms in the city or country in which the congress happens to be meeting is not, of course, its first object. Nevertheless, it was hoped to use this fifteenth meeting, the first ever held outside of Europe, as a leverage for lifting permanently into the public mind several matters of elementary importance. One of these related to the Panama Canal. While our accomplishments in sanitation on the isthmus give us just cause for pride,<sup>2</sup> the future success and value of the canal as an international thoroughfare depend largely on the continuance of work now going on. The present congress, it was thought, provided a timely opportunity to convince the world of this, as well as to exhibit the methods and results of our sanitary efforts in the Canal Zone. For this reason it was especially unfortunate that Colonel W. C. Gorgas, "the man who made the Canal Zone habitable," was prevented from attending the gathering and from delivering his scheduled address by the failure of the United States Congress at its last session to appropriate any money for traveling expenses for him and other officials. Dr. J. A. Le Prince of the Canal Commission was on hand, however, to describe the new methods discovered and now in use for waging war on malaria.

Another reform which it has been hoped the congress would accelerate has to do with vital statistics, in which the United States with its meagre registration area has lagged far behind European countries.

The various sections into which the congress was divided and the exhibits will be reviewed more fully in a later issue of *THE SURVEY*. One or two points may be noted here.

With much that was familiar there was much also in the week's discussion that, to many at least, took on the character of discovery or of information made public for the first time. The newspaper dispatches make it obvious that by no means the least service rendered by the

<sup>1</sup>See the *Monthly Bulletin* of the Department of Health of the City of New York, August, 1912; page 193.

<sup>2</sup>See Sanitation on the Isthmus, by James Ten Broeck Bowles, page 41.

gathering will be the wide discussion among laymen of more or less technical medical knowledge which nevertheless has its direct bearing on healthful living from day to day. That typhus fever has been traced to the louse as carrier, and that measles are ordinarily communicated, not by the scaling off of dried particles of skin, but by the fine spray thrown out in the act of sneezing or coughing, are types of this sort of medical learning which found a place in the press dispatches.

Specific conditions were held up to the public by expert hands in ways that made clear the danger ahead unless timely precautions are taken. Thus, T. Kennard Thompson, vice-president of the American Society of Mechanical Engineers, in illustration of his statement that caisson disease is often due not so much to work in compressed air as to work in foul atmospheres, called attention to the deposits of sewage in the Harlem River near New York. During the construction of the Harlem River tunnel, said Mr. Thompson, men complained of the "bends" when passing through the foul mud in the bottom of the stream. Tests that were made showed very clearly that the tides are not carrying all the sewage; a black putrid mud of offensive smell settles on the bottoms of the Harlem, Hudson and East Rivers. Here, said Mr. Thompson, lay the hot bed of an epidemic. "It would even be dangerous to pump the water to put out fires," he continued, "as so much foul mud would thus be scattered over the city to dry and spread as dust."

Another condition, quite as potent for evil, though less local in nature, was pointed out by Dr. George Reid, health officer of Stafford, England. Dr. Reid recently conducted an inquiry for the Home Office Department of the English government which, among other objects, sought to determine more accurately the effect, if any, of the labor of married women on infant mortality. The twelve months' life history of 5,000 infants born in families of the artisan class in the pottery towns of north Staffordshire was studied. The infant mortality among the class of working mothers was found to exceed that among the housewives by 43 per cent. By a shift in the statistical classifications it was found that the mortality among infants partly artificially fed exceeded that of the naturally fed class by 79 per cent, that those wholly artificially fed exceeded the breast fed babies by 157.

The discussion of course went further than the mere pointing out of evils. As a step toward their elimination, there was call for a national board of health, and for a training school, something like West Point, where young men intending to make railroading their life work may be trained to an efficiency that would lessen the

number of accidents in travel. Dr. Charles G. Kerley of New York argued for a commission or committee by which the state should exercise more complete authority over every child. "It is only by such means," he said, "that we will ever solve many of the urgent problems before us. Prophylaxis against crime, degeneracy and general worthlessness are in the hands of the public for the signal betterment of the race."

At times the more familiar arguments dealing with hygiene, vocational disease and work accidents thus cleared away to make room for a sharp pronouncement or two on the subject of eugenics.

Dr. Kerley offered entire agreement with the persons who, he said, "had declared that if two infants, one born in a palace and one in a hovel, both in fair physical condition, were exchanged on the day of birth, each would work out his destiny along the lines of his environment. The child of the hovel would grow up to the palace and the offspring of the palace would remain on the level of the hovel. Character indicates the individual. Heredity has but little influence in determining character. Character above all things else is the product of environment."

Confining himself to the problems of brain, as distinct from character development, Dr. L. F. Barker of Johns Hopkins University laid emphasis on sound heredity as the condition precedent of a good mind. "Only a minority of the public know," said Dr. Barker, "that the kind of mind an individual has depends on the inborn qualities of brain he inherits and the influences which act upon it afterwards." "By a campaign for mental hygiene," he declared again, "is meant a systematic attempt to secure human brains, so naturally endowed and nurtured that people will think, feel and act better than they do now."

Agreement among experts is proverbially an unusual thing, yet resolutions were adopted approving the suggestion that an international committee be appointed to bring about uniformity in methods of classification of the different organisms of the colon bacilli, which causes typhoid fever; that occupational diseases be reported in uniform manner by international agreement; that greater uniformity be obtained in the reports of the medical departments of the navies of the world as to the causes of disability or death; that an international agreement be made on the manner of collecting reports of marriages, births, deaths and divorces, and that such reports, made to conform to a uniform standard, be published periodically; that a commission be appointed to bring about uniformity in criminal statistics and that the permanent international committee of the congress be instructed to establish a permanent bureau for fu-

ture congresses. It was decided that such a bureau shall be established in the immediate future, to be located at The Hague.

### THE SUCCESSORS TO THE FATES

The medallion reproduced on the cover of this issue of *THE SURVEY*—the official emblem of the Fifteenth International Congress of Hygiene and Demography—was designed by Victor David Brenner of New York, perhaps most widely known as the designer of the Lincoln penny.

The figures on the medal symbolize the overthrow of the three Fates who, in the mythology of ancient Greece, spun and snipped at will the thread of human life. Hygiene and sanitation have in these modern days wrested the control of life away from these ancient sisters, and in

summoned one to the cradle side. Him she bade follow the thread, from the first whimper of the newly born to the last hour of his appointed calendar: for so each mortal made his earthly transit, trailed by his Doom unseen, unheard, yet ever at his heels.

"Lachesis, second of the grim sisterhood, spun the thread to a length foreknown.

"Atropos, eldest and ugliest of the three, wielding shears as cruel in sport as in earnest, menaced the thread; and soon or late, caring only lest the common lot should lack infinite variety, cut it, adding a limp thread more to her handful. Then the kind Earth upraised a little heap to hide the Man who was: then sped the Soul to Tartarus; and the Doom back to Clotho, there to await another cradle call.

"A poet he must be who can wrest an attribute from the un pitying Fates and make it the dominant of a theme as significant as this in which Mr. Brenner has tried to symbolize

THE OFFICIAL EMBLEM OF THE FIFTEENTH INTERNATIONAL CONGRESS OF HYGIENE AND DEMOGRAPHY, DESIGNED BY VICTOR DAVID BRENNER

peace and safety spin the thread. This is the prophetic theme.

The idea was that of Dr. John S. Fulton of Baltimore, secretary-general of the congress, who has written the following explanation of the emblem:

"Sisters they were, Clotho of the distaff, Lachesis the spinner, Atropos of the shears; of dreadful aspect, and so feared by men that the ignorant propitiated them with mistaken rites, at the wrong altars, confusing the Fates with the inferior and more terrible Furies.

Clotho, youngest of the three, presided over the birth of mortals. Diademed and richly clad, she sat enthroned among the stars, her distaff resting its foot on Earth, its flax-crowned tip reaching to Heaven. And as she called the roll of mortals crowding to be born, Clotho plucked a wisp of flax, started a thread, passed it to her sister, and, from a throng of waiting Dooms,

the present aspect and future promise of hygiene.

"In these two figures we have a vision of efficient motherhood—motherhood in the purple, stately, and wise—postulant motherhood in a tunic, slim and unaware. And they are nobly occupied, compelling the beholder's interest in their handiwork—a loop of thread, spun, as all life is spun, from the immortal plasma: expendable, corruptible, yet aggrandized and incorrupt throughout an incommensurable past; still imperfect, but perfectible through an infinite future.

"Perhaps the artist did not mean to express himself in terms of eugenics. He probably did intend to reveal the future promise of hygiene, rather than its actual attainment; and so the picture developed of necessity upon such lines as we see here, not descriptive, but ascriptive like the rich mythology to which it is so clearly kin. The eugenic phrase is inadequate, but the picture itself is eloquent. Its unphrased motive

is eugenic, and its reverent ascription to womanhood is true. These two creatures, and their like, are they that have prevailed hitherto, and will prevail. Theirs is the last work in hygiene."

### THE HUMAN SIDE OF LARGE OUTPUTS

It is just a year this month since THE SURVEY started the publication of John A. Fitch's articles on the Human Side of Large Outputs. They presented the results of an investigation carried out under a special fund supplied by Charles M. Cabot of Boston to see to what extent conditions disclosed by the Pittsburgh Survey in the Pittsburgh steel district were duplicated in the other centers of steel production. "Human events" have moved rapidly in this great industry in the last year, and it will be opportune to gather together in a few paragraphs especially the developments of the past summer. The October number of *The American Magazine* tells in its leading article<sup>1</sup> the graphic story of Mr. Cabot's campaign as a stockholder of the steel corporation.

On May 4 THE SURVEY published in full, together with editorial comment, the report of the stockholders' committee which at his instigation had been investigating labor conditions. It will be remembered that this report which sweepingly condemned the seven-day week and the twelve-hour day was presented at the annual meeting of the stockholders on April 15 and was unanimously adopted.

Late in May the full report was mailed to all the stockholders of the Steel Corporation, together with a communication from Judge Gary which summarized the report and expressed hearty appreciation of the work of the committee.

Further than this, Judge Gary was able to announce that already the finance committee of the corporation had held a meeting in which the report was considered, and had taken action designed to make its provisions effective.

At this meeting the finance committee adopted resolutions declaring that in accordance with the spirit of the resolution adopted in 1907, seven-day labor should be absolutely eliminated from the properties of the Steel Corporation "except under special circumstances and then only upon the consent of this committee." It resolved further that the so-called long turn should be eliminated and that "conscientious effort should be made by all to reduce to a minimum any unusual length in work hours that emergencies and unforeseen conditions may sometimes demand."

Then, taking up the question of the twelve-hour day which the stockholders' committee had declared was a condition that ought to be remedied at once, the finance committee adopted a

resolution "that the chairman (Judge Gary), Mr. Roberts, and the president of the corporation (Mr. Farrell) be appointed a committee to consider what, if any, arrangement with a view to reducing the twelve-hour day, in so far as it now exists among the employees of the subsidiary companies, is reasonable, just and practicable."

With regard to the recommendation of the stockholders' committee that reports be made to the stockholders at stated intervals as to labor conditions and their improvements, Judge Gary states that the finance committee has arranged to have a plan prepared and reported to it.

At just about the same time that these resolutions were being passed, Congress was enacting into law the eight-hour bill which provides that with certain exceptions, all work done for

Photo by Line  
AN OLD MILL HAND

the government under contract and all work done on materials that have been contracted for by the government shall be done on an eight-hour schedule. This law applies extensively to the steel industry, especially with regard to armor plate.

Meanwhile, the Stanley committee was holding sessions and framing its report so that finally on August 2 there were presented to Congress by this committee a majority report and two minority reports with regard to the United States Steel Corporation. While this committee was charged primarily with the consideration of the relation of the United States Steel Corporation to the Sherman Anti-Trust Law, it gave a considerable amount of attention at its hearings to labor conditions.

It may be noted in passing that Margaret F. Byington, Shelby M. Harrison and John A. Fitch, three members of the Pittsburgh Survey's staff, were among the witnesses called to testify.

<sup>1</sup>A Great Corporation Investigates Itself by Frank Barkley Copley.

Labor conditions are also discussed in the reports of this Congressional committee. Congressman H. O. Young of Michigan, who presented a minority report of his own, remarked that complaint has been made with regard to hours of labor. His explanation was that these long hours have arisen out of the necessity of continuous operation and he dismissed the matter with the assurance that "while the condition of labor is not ideal, it is at least as good as among the competitors of the United States Steel Corporation."

Congressman A. O. Gardner of Massachusetts, who presented another minority report, made the clear statement that "the labor situation in certain manufacturing departments of the steel industry has always been bad and today is bad." He referred to the twelve-hour day and the

men. The majority's criticism of hours of labor and wages paid was very severe.

Along with this unusual series of reports on labor conditions in the steel industry, all of them either declaring against the terms of work current in the industry or suggesting that improvements are about to be made, there has been an unusual amount of labor unrest among the steel workers the past six months, especially in the Pittsburgh district. THE SURVEY has described the brief strikes which occurred in the works of the National Tube Company and of Jones and Laughlin in Pittsburgh. Both of these strikes were carried on by absolutely unorganized workmen and represented simply the demand of the workers for improved conditions. The presence of I. W. W. organizers in the Pittsburgh district has added to the general feeling of uneasiness, and in the latter part of August, the American Federation of Labor indicated that it was keeping an eye on the situation. A circular was issued from headquarters of the federation which was marked as Circular No. 1 and was addressed to workers in the iron and steel industry. This circular set forth the fact that the federation has a plan, which it proposes to put into effect, of organizing all the workers in the steel industry. It announces that Circular No. 2 will shortly be issued which will explain the aims and objects of organized labor, and after that Circular No. 3 is to be issued which will inform the workers of a date upon which meetings are to be held in every steel town in America. These meetings will be held simultaneously for the purpose of organizing the steel workers, the object being to prevent the playing off of one mill community against another by the removal of orders from one mill to another as would be done if an attempt were made to organize only one part of the industry at a time.

Just what is to come of all the many plans which are being worked out in so many diverse quarters with regard to improving the conditions of labor in the steel industry remains to be seen, but the one fact which becomes increasingly apparent is that out of it all a better condition must come into existence. The Steel Corporation may be opposed to organized labor. It may be opposed to legislation requiring it to adopt a certain schedule of hours. There may be a conflict along both of these lines; but when the stockholders of the Steel Corporation, the Congress of the United States and the organized workingmen of America all agree that a six-day week and an eight-hour day in continuous industries ought to be adopted, it is evidence of what may fairly be described as an industrial revolution since the days of clamped-down inertia, which the Pittsburgh Survey pried into in 1908 and 1909.

Photo by Hine

A YOUNG STEEL WORKER

seven-day week as seemingly incredible but nevertheless indisputable facts. He expressed the belief that the corporation is improving this situation but "we cannot forebear from uttering the suggestion that three shifts of eight hours each ought to take the place of two shifts of twelve hours each."

The majority report signed by most of the Democratic members of the committee contained some interesting data regarding wages, tending to show that while the average daily wage of \$1.89 paid in 1902 had increased to \$2.09 in 1909, the labor cost had decreased. For 1902 the cost of labor per ton was \$1.25, while in 1909 it was 82 cents. A short discussion was presented on the Union Supply Company, a subsidiary of the Steel Corporation which maintains stores in some of the company towns. The committee condemned the attitude of the corporation with regard to labor unions and criticized the apparent tendency to employ foreign work-

## BETTER HOUSING IN HOOSIERLAND

The publication in this number of *THE SURVEY* of 'The Divine Call' brings to mind the part which its author, Albion Fellows Bacon, has played and still plays in one of the most interesting state campaigns for better housing which has taken place in this country.

From the time when Indiana was first nicknamed the Hoosier state, because wayfarers knocking at ill-built farm shacks were greeted with the query "Who's here," to the present day of city slums, Indiana has had a housing problem. About 1908 some public-spirited citizens of Evansville took the first definite step toward improving conditions. Mrs. Bacon was intimately acquainted with the bad housing of Evansville, and so it was she who, with the assistance of local help, prepared the tenement ordinance which later became law.

Following this local victory, an investigation of conditions throughout the state was started, with the co-operation of the Indianapolis Commercial Club and of social workers in general. Soon a state-wide tenement law was drafted, modeled, like the Evansville ordinance, upon New York's prior statutes, but changed somewhat to meet Indiana's special needs. Mrs. Bacon took this law to the legislature of 1909, and was one of the most active in securing its passage for two cities, Indianapolis and Evansville. It has materially improved conditions in these places. In 1911, Mrs. Bacon again went to the legislature with a state-wide bill. This was a code prepared under Lawrence Veiller's direction and built upon the model law of the National Housing Association. The bill was lost by the changing of one vote, after it had been considered won for an hour.

Indiana housing reformers, including Mrs. Bacon, expect to meet their legislature again in 1913, armed with another state-wide code. Meanwhile, they are improving the occasion by campaigns of education throughout the state. The South Bend Chamber of Commerce has gone into the movement and an Indiana Housing Association was organized recently. The State Board of Health is said to be adopting the cause of better housing and the Indiana Federation of Women's Clubs has taken it up with the slogan "The Homes of Indiana." Meanwhile the eyes of those in other states who are interested in better housing either from ideals of city planning or improved conditions of life are turned on the state where Katherine Bottorff found tragedies in village slums. In pointing the way to higher standards of health and comfort, and the husbanded energies which these bring, Indiana can play preceptress to her sister states.

### POLITICS AND SOCIAL WORK

EDWARD T. DEVINE

With the creation of a national progressive party and the reaction of this event on the older parties, *THE SURVEY* and all the inter-related social movements of which it is an unofficial spokesman enter upon a new era. We would not be dogmatic or precipitate in saying just what this new era is to be. What seems certain is that something like a silent and complete revolution in public sentiment has taken place, corresponding in its larger outlines to the more obvious and more fragmentary changes which find expression in national and local platforms. The nation now sees and feels what was felt and seen clearly by the pioneers. No one man can long dominate this situation. No one party can fully represent the quality of the new epoch. "Safe and sane" democracy, "safe and sane" republicanism and the most unsafe and insane progressivism which we have yet encountered in real life are all in the inexorable grip of the *Zeitgeist*, moving irresistibly towards that view of life which we described in this journal more than five years ago as "the new view of the common welfare; the new view of industrial and social forces; the new view of childhood, of womanhood and manhood; the new view of housing as the basis of domestic life; the new view of industrial occupations and the conditions under which they are carried on; the new view of misery and crime and disease as eradicable; the new view of charity, of reformation, of discipline, of human society; the new view of work, of recreation, of neighborhood; and at last, the new view, prophetic though it be, of a social order in which ancient wrongs shall be righted, new corruptions foreseen and prevented, the nearest approach to equality of opportunity assured, and the individual re-discovered under conditions vastly more favorable for his greatest usefulness to his fellows and for the highest development of all his powers."

There is nothing depressing about the discovery that even here in favored, prosperous, and happy America there are wrongs to be righted, privilege and exploitation to be stopped, disease to be overcome, weakness to be protected and poverty to be abolished. What would be depressing, is that such things should be and that the nation should not be consciously aware of them. Moreover along with the full realization of the task there comes an equal realization of the great resources at our disposal for the work which needs to be done. We do have adequate resources physical and spiritual for the undertaking. The fact of a disposable social surplus is as important a factor in the revolution which has taken place in public opinion, as is the fact

of imperative social needs to which that surplus must be applied. People have ceased to be interested in old party slogans for the double reason that they see real work to be done and are aware of the strength of their arms for the accomplishment of that work.

This revolution, whatever the outcome of the national election, is an accomplished fact, and one in which all good citizens, regardless of party affiliations, may rejoice. It behooves social workers to take sober thought as to how this national awakening affects their own position and their immediate future. There are some who have seen their opportunity very clearly, as they believe, in actual participation in the political campaign. In many instances social workers have had their first baptism this year in that kind of citizenship which we call politics. They have helped to write platforms, select candidates, and create campaign literature. They have championed their cause and their candidate on the stump. And even more frequently perhaps, they have helped to turn the course of a campaign in that quiet interchange of speech between man and man which does sometimes affect opinions and votes. We have no need to await the November polls to learn that this active participation of our comrades in the political campaign has had a perceptible and lasting effect. In the choice of candidates, in the promises of conventions, in the invention of devices for seeing that promises are kept, and in the substance of the arguments put forth in debate, this effect is clearly discernible. Whichever party wins in the national election, this campaign must always be remembered as the one in which progressive social reform came to its own.

Both Colonel Roosevelt and Governor Wilson have of course qualified as progressives in the field of social reform. No one doubts their sympathy with such policies as we have steadfastly advocated in this journal for the past decade. President Taft may not have been entirely successful in satisfying eager reformers but how can any one question his interest in such progressive measures as workmen's compensation for industrial injuries, a more rational method of settling industrial disputes and the prevention of strikes by the removal of their causes, the establishment of postal savings banks, the development of a national public health service, the safeguarding of the interests of childhood through direct research and educational publicity by the federal government, and the working out of an adequate system of budgetary accounting to enable the public to understand what is being done and what is not being done in the departments? If these are not typical and fundamental features of a rational program of social work we have no right understanding of what such a program should include. Whether President Taft, or Governor Wilson, or Colonel Roosevelt

would be able to accomplish more in these directions in the next four years is the issue on which for the most part social workers as such will make their choice. On this issue this non-partizan journal is expressing no opinion. Our primary concern lies in another direction. Now that political leaders have become social workers shall we in turn definitely cast in our lot with whatever political party comes nearest at the moment voicing our aspirations and ideals, and expect that social salvation is to turn on the outcome of a particular election? We answer that the supreme exercise of citizenship does not lie in political campaigning, however necessary and exhilarating that may be. This is reserved rather for those who stand steadfastly, or press forward persistently, as the case may be, with an eye single to the common welfare, in campaign years and in off years; when candidates are before the people and when, having been duly elected and qualified, they are before their desks; when voters are excited and when they are indifferent; when issues are eagerly canvassed and when long afterwards they are calmly put to test in the courts. To a certain type of politician the participation of social workers in the campaigns of this year is the more disturbing because they represent mainly this type of citizenship.

We hold it to be the first political duty of social workers to be persistently and aggressively non-partizan; to maintain such relations with men of social good will in all parties as will insure their co-operation in specific measures for the promotion of the common good. They should be equally ready to challenge the evil that is and the evil that is proposed. They should have open minds for the truth from any quarter and discerning minds as to what is the truth. Partizanship blinds us to the just claims of our opponents, deprives us of what may be our best opportunities to accomplish real things, alienates some of our natural allies and friends, distorts our judgment as to desirable ends, and destroys our power of choosing the best means to these ends. A great weight of influence and usefulness accumulated through years of non-partizan effort may conceivably be thrown once on either side of a political issue and in the process lost forever. A spendthrift squandering his capital is not more foolish than the partizan social worker who attaches himself for better or worse, through thick and thin, to any one of two or more contending parties in the state. Political activity does not of course necessarily involve such partizanship. We are not suggesting that social workers should abstain from political activities. Looking to the future, we are only insisting that participation in politics should be subordinated to a long range policy which does not undermine permanent influence. We urge consideration of the limitations as well as of the possibilities of

political action. After the votes have been counted, there will still be need for the services of men who know the facts of social conditions, who are truth-telling, courageous and level headed, who are instinctively identified with rational progress but not with obstructive reaction or with reckless and destructive experiment. And such men in order to be of service need not necessarily be in public office.

## HUMANIZING POLITICS

GRAHAM TAYLOR

Whatever may be thought of the political parties involved or of the positions they have assumed in the pending campaign, few can fail to see that a new social consciousness and conscience are aborning in all the parties, and that the campaign is sure to be of great educational value and social significance. While it is not the function of *THE SURVEY* to advocate or criticize party preferences, it is directly within its province to discuss the social tendencies and humanitarian bearings of their platforms and their administrative measures.

It is with impartial satisfaction that the tendency to humanize their purposes in their prospective administration of government is noted in each party. The first indication of this tendency, and that which made it possible, is the changing standard of party loyalty. It has not so much broken down as it has risen. It has emerged from blind allegiance to the party as an end into a discriminating loyalty to party as a means. Thus it has become possible for more and more voters to put their country, their city and great common human interests above the claims of their party, and to test its organization by its sincerity and efficiency as a means to serve these higher ends. Any party worthy of loyalty cannot fail to gain whatever makes it worthy to succeed by being held by its members to this test of serving human interests the best. For in the long run that party which serves its country best will thereby prove to serve itself the most.

The ascendancy of human interests over partisan self-seeking in the councils of the parties has been marked since the epoch-making conferences on the conservation of our national resources and on the welfare of the children which were held at the White House at the call of President Roosevelt. The establishment of the Children's Bureau and the appointment of the Industrial Commission are social achievements highly creditable to President Taft and his administration.

The progressive movement in American politics and government is far greater than any one party. That a new party should claim that name and should have organized so rapidly throughout the entire country on the basis of a social-

economic platform proves the progressive spirit to have been sensed in the very air. The launching of a progressive party cannot fail to develop permanently progressive policies in other parties. Its effect is already observable in the campaign utterances of the candidates and representatives of the other parties, which are much in advance and far afield beyond the platforms adopted and published prior to the third party convention. Governor Wilson's advocacy of the promotion of public health and of the social use of public school buildings, though no less genuine and in accordance with the social outlook, which he has always taken, is nonetheless his recognition of the demand of the people for emphasis upon human interests by those claiming the capacity to govern. In simple justice to the Socialist, Prohibitionist and Populist Parties, be it said that many of the ideals and some of the measures now for the first time found among the policies promised the people by the other parties have been for a long while minor planks in the platforms of these minority parties.

In noting the present appearance in politics of humanitarian purposes, declarations for social justice and industrial rights, and of provisions for the more direct control of government by the people, we should not fail to remind ourselves whence these principles came into the consciousness of political parties. Administrators of private charity and public correction have been studying the conditions and antecedents of dependency and delinquency with ever-increasing thoroughness. They have learned themselves and have taught others the possibility and duty of arresting both at their sources by controlling the conditions which in large part produce them. But as the control of these conditions transcends the power of private agencies and voluntary effort and can be hoped for only through the authority and resources of the state, public opinion in all lands has been tending increasingly to exert political action for governmental measures to grapple with these great human problems. These measures, however, have been undertaken frequently, despite the persistently aggressive opposition of the very charity workers whose thorough-going investigations and scientific methods have led the public to demand from their governments more than all voluntary efforts at their best seemed likely to achieve. Significant in the present American tendency in this direction is it that many of our most experienced and trusted leaders in voluntary philanthropic and social work are supplying both the initiative and the balance wheel to start and steady the movement.

Both labor and employing capital have also been learning and assuming their responsibility for better working conditions. Cautiously as each of them has approached what they had reason to fear might prove to be a two-edged

use of legislation, nevertheless both of them have had to reckon with the public demand for legalized oversight and control. Happily voluntary efforts and legislative measures for promoting and protecting the interests of both are going on together. But inevitably each of these imperatively necessary efforts for industrial peace and progress prompts the political action which must precede governmental policies. Fortunate will it be, if this political action so quickly pervades all parties that it will lead to non-partisan, governmental policies in the interests of the whole people.

Educational institutions and literature have steadily but all too slowly, established scientific points of view, methods and spirit through which more and more trained men and women are approaching the practical problems of life and are enlisting in the most serious and sustained efforts for their solution. Our high schools, colleges, universities, professional schools and schools of civics and philanthropy are thus furnishing some of the agitation, and more of the education, to which the social aspects of the political movements are due, and upon which they must depend for the guidance of their constructive developments.

Legislation has not only registered each advance of social consciousness and conscience, but has also been an education propaganda of prime importance. Non-partisan and wholly public-spirited as has been the work of such organizations as the Association for Labor Legislation, the Consumers' League, the National Child Labor Committee, the American Institute of Criminal Law and Criminology, the National Conference of Charities and Correction and the Russell Sage Foundation, they, one and all have contributed to the agitation and education of the public to demand the humanizing of politics and government.

Last, but by no means least, the humanizing of religion is inspiring the overarching ideal and underlying motive which together generate the power for all progress and which must be relied upon to steady the movement toward it. As England was fortunate enough to have experienced a revival of religion while struggling and suffering her way through the throes of the industrial revolution, so America's Men and Religion Forward Movement and the strong social inclination attending the federation of her protestant churches; the growing social emphasis placed by our Roman Catholic churches in all their parish and institutional work; the uniting of our Jewish charities, the magnanimous giving of Jewish philanthropists and the service of Jewish publicists, all far transcending the bounds of race or creed; and the leavening social ideals and discipline, distinctive of the Ethical Culture Schools and Societies all combine to give both impulse and balance to our social politics as we enter this new era of our history.

It is surely significant of progress and not of retrograde, of hope and not of fear, of unity and not of divisiveness, of a movement of the masses of our people and not of class hatred, of better and not worse times coming, to read in the leading editorial of a foremost political newspaper the following "keynote of real progressivism":

"The collective intelligence of the nation, of the great American community, should deal directly with the conservation of the people's health and strength. We need to get rid of a lot of dead lumber in our public discussions and get hold of some practical truths as that—malaria decreases the value of land at least \$10 an acre; hookworm, by producing inefficiency, influences the price of cotton goods more than the tariff; pellagra is a problem as important as currency reform; consumption is of more consequence than the coinage of silver; pauperism is a practical problem that deserves the most persistent and thorough study; social justice is a necessity if our republic is to endure; the kind of help given the farmer for his stock should be given him for his family; communities should be helped to banish consumption and typhoid fever; mothers should be protected during child bearing; the slaughter of the innocent should cease; children should be given a chance to grow up in strength; men should be enabled to labor at high efficiency; prevention should replace cure; pauperizing men by charity should give place to a scientifically developed scheme for the care of those who need to be cared for along broad economic lines."

In all this neither American patriotism nor religion can fear the loss of anything valued by either; and to it all both can contribute whatever this movement needs to be safe, sound and sacred.

## PRAGMATISM IN POLITICS

JANE ADDAMS

An English writer has recently pointed out that popular elections may go through the same development as did the jury system which, in the beginning, merely registered the opinions of twelve men, until it gradually became obvious that their opinions must be formed under fair procedure; then the process itself was so developed and the interviewing of witnesses so controlled that these processes finally became the really essential features of the trial.

America has long been concerned that the registration of the voter's opinion at election should be fairly done, and to this end has instituted the Australian ballot system and many another device, but has as yet done little to develop a careful method by which the voters might form a sound judgment.

The published accounts of the various efforts to manufacture opinion which preceded the party conventions this year and of the enormous ex-

penditure of money which these efforts entailed have made the public cautious, and as a result, all the parties are perforce driven to the pragmatic method, if one chooses to call it so. Politicians are ready, as never before, to conduct the campaign upon educational lines, to drop that oversimplification of current problems to which a campaign always tends and to stem the flow of political eloquence by a painstaking presentation of facts.

The educational value of the current Presidential campaign is most important to the American voter, irrespective of the party which claims his vote. A new method is being evolved freed from the old shibboleths and fitted to our industrial development.

The American voter is not content with the eighteenth century formulae of liberty and equality, high-flown as they are, for they do not apply to the situation. Liberty has come to be a guarantee of equal opportunity to play our parts well in primary relations, and the elemental processes of birth, growth, nutrition, death are the great levellers that remind us of the essential equality of human life. No talk of liberty or equality "goes" that does not reckon with these.

It is possible that this campaign will not only bring the United States in line with the great European countries which have made social standards for labor the subject of governmental action, but that it will also bring American politics, so long an anachronism in spirit, into line with our development in other directions. Certainly the wisest philosopher of America contended to the day of his death that even "Philosophy is not sufficient unto itself but plunges eagerly into reality, into science, into life, there to be refreshed and rejuvenated."

This pragmatic element in the present campaign has inevitably challenged those institutions which base their activity upon a careful study of social conditions; they too, like the voter, have been driven to realities, are made to test the validity of their phrases.

Institutions, perhaps more easily than individuals, tend to grow self-conscious. It is not difficult for an institution to think so much of its future usefulness as to forget the cause it is serving and for which it is founded, and this may happen quite aside from any question of alienating subscribers. We all forget that "influence," whether of persons or of institutions, ceases to be of real value when it is consciously cherished as a possession, that it must be a "way-side flower", as our old copy-books used to say about happiness. One can think of no greater travesty on worship than a whole churchful of people who had all gone there for the sake of their example to someone else, nor could there have been a more dreary comment on the spirit

of philanthropy than if the Chicago social workers last winter should have allowed the most highly developed juvenile court in the world to go to pieces under their very eyes, because they were afraid of injuring their personal influence by interfering in the situation which was one of partisan politics.

In fact, an institution may easily become detached from the life of its community and fall into a position similar to that occupied by many women in relation to their own family circles. I know women who resent the moral idleness to which they have been relegated through the very kindness and respect of their grown-up children. They are, of course, expected to give advice and to advocate only the noblest and highest principles, but because they live so remote from reality, some of them gradually distrust their own conclusions and frankly accept the moral standards, which their sons, flushed with action, bring to them from the "marts of trade" and the exciting "political arenas"; others openly abandon their safe haven of peace and certitude. It is true that they can no longer claim to be a fixed point of righteousness in the boiling sea of perplexing issues, but they are glad to be free from the harassing doubt that possibly the righteousness they were advocating was not righteousness at all. Their so-called inferior position is at least tested by reality and constantly clarified in discussion.

In like manner, an institution which stands in the minds of the community for "good works" is in danger of substituting the unreal activities of being good to people for the sterner task of ascertaining their genuine needs and of ministering to them in all humility of spirit.

It is impossible to consider the complicated conditions of modern life with its proposed measures of legal control and social amelioration from the *a priori* point of view. Perhaps the gravest danger which besets a well-established institution is a subtle self-righteousness, a tendency to substitute the smaller good for the larger good; to consider the philanthropist as superior to the politician. Adequate measures for social amelioration can only be carried out with the consent of all the people and the wisdom of such plans are best discussed in relation to the realization of opinion, to use John Morley's fine phrase. Certainly we have all learned that new ideas can never gain wide acceptance unless the persons who hold them confess them openly and give them an honest and effective adherence. When the ideas and measures we have long been advocating become part of a political campaign, which is after all but an intensified method of propaganda, would we not be the victims of a curious self-consciousness if we failed to follow them there?

*[We are familiar with Chicago and Detroit, Cleveland and St. Louis. They are big red spots on the maps in the geographies. But do we know overmuch about Argo and Gary, Corey, Norwood, Granite City and the other industrial satellites which are springing up under the eaves of the great urban centers?*

\* \* \*

*There is a countryward movement of factories. The highest engineering skill lays out the suburban plant. How about the suburban industrial town?*

*Does it feel the impulse of the city planners?*

*What of the homes of work people who follow out into the new territory. What are their recreations?*

*Who is paying the bills of the new towns and what share of the leaping land values is turned to social account after the manner of the English town planners?*

*What chance for getting on in the world is there for the children of the industrial towns?*

*What is going to give the metropolitan district made up of outlying workaday communities a sense of common purpose?*

\* \* \*

*Graham Romeyn Taylor of The Survey staff has been making a study of some of the most notable examples of these satellite towns. The results of his investigations will be published in a series of articles of which this is the first. They will run in the magazine numbers of The Survey throughout the winter.—Ed.]*

# I

## THE OUTER RINGS OF INDUSTRY

**W**HILE we go about merely talking "back to the land," huge industrial plants are uprooting themselves bodily from our congested districts. With households, small stores, saloons, lodges, churches, schools clinging to them like human tendrils, they set themselves down ten miles away in the open.

While we spend years of effort in reconstructing our civic centers, only to have our schemes stalled by costly obstructions of brick and mortar and condemnation proceedings, city planning as

a process is going on every week and every month on the edges of our cities.

Towns made to order entirely, or with some little village as a core, snatch bundles of papers from the morning trains, smudge new postmarks over sheet after sheet of red postage stamps, edge their way into the telephone toll books and the freight tariffs, scrawl their names on the tags of new-coming immigrants at Ellis Island and become part and parcel of up-and-doing municipal America before most of their

THE CHICAGO SATELLITES

slower going sister cities have even heard of their existence. A neglected opportunity for formative work not only in city planning but in social organization is presented in the satellite communities with which industrialism is surrounding our great centers of population.

From the middle of Philadelphia, several departments of the Baldwin Locomotive Works have been shunted out into a small suburb. Flint, Mich., two hours from Detroit, has been seized as the place for huge automobile factories. While the population was trebling in the first three years, several hundred operatives had to be housed in tents throughout one summer. A big corn products plant moved from the middle of Chicago to the nearby prairies and a "glucose city," Argo, started up. It occupies part of a tract of ten square miles, which one promoting company is developing as an "industrial district" and into which Chicago has already emptied more than a dozen establishments. Just outside Cincinnati a residential suburb, Norwood, is now the home of a score of manufacturing concerns. Impelled partly by the arbitrary tolls charged on coal carried across the Mississippi river, industrial plants have moved over the bridges from St. Louis and founded a group of new towns in Illinois. The Standard Oil Company, a few years ago, poured out \$3,500,000 on the bank of the Missouri a few miles from Kansas City, and the town of Sugar Creek sprang up. Staid old Yonkers long since lost its individuality in a smother of hat and carpet factories. The metropolitan manufacturing district stretches out in belts and flanges from New York into Long Island, Staten Island and New Jersey, while

eastern Massachusetts is a mosaic of mill towns. In some sections of the South scarcely a city of any size lacks one or more satellites thrumming with spindle and shuttle.

Gary with its twenty-five thousand population, where six years ago there were only rolling sand dunes covered with scrub oak, is thus seen to be but the largest and most spectacular single fact in a far-reaching industrial exodus. Far-reaching and fast-moving, for Gary had scarcely attained four-year-old dignity when work started on the newest of the United States Steel Corporation's brood of steel towns—Corey, on the edge of Birmingham, Ala. On the heels of Corey came the rumor that more millions and another plant would found another steel town near Duluth.

This industrial exodus from city center to suburb had a prototype in the more sporadic movement which established Pullman and Homestead in the early eighties. These two places were by no means the only forerunners. South Omaha, for example, in 1883 sprang up around the stockyards at a railway junction so rapidly as to win the name, "Magic City." These exceptional towns, suddenly created at the dictate of pioneer master minds of the new industrialism, thrilled the popular imagination.

But they were eddies where the present movement has taken on the proportions of a formidable back set current. It is utilizing suburban areas as well as creating made-to-order towns. The Census Bureau has gathered data from thirteen "industrial districts," each of which covers a large city and its vicinity. From 1900 to 1905 the number of persons employed in industries in the surrounding zones increased 39.4 per cent, while within the corporate limits of the cities proper there was only 11.8 per cent increase.

THE CINCINNATI SATELLITES

Many reasons are readily apparent for the location of these new industrial communities. The impulse toward cheap land, elbow-room, and low taxes throws them out from the large centers of population. These are the centrifugal forces. The centripetal forces are equally powerful and bind them as satellites close beyond the outer rings of the mother city. Even the towns which, like Gary, have attained a considerable measure of self-sufficiency and lie perhaps across state boundaries are bound by strong economic ties. Through switch yards and belt lines, practically

THE BIRMINGHAM SATELLITES

it count? Of playgrounds and schools? Of living costs? Of city government, politics and civic spirit?

There is a public challenge in the very fact that in these localities civic and industrial conditions are being created brand new, on a whole-sale scale, without the handicaps and restrictions which high land values and prior improvements impose on every effort to reconstruct the congested centers. Are we cashing in these advantages? In our general municipal development, we pay more and more heed to the counsel of city planner, housing expert and sanitarian. We struggle to reshape our rigid, old-established conditions to fit newer and more workable molds, just as the manufacturer has to tear out, rebuild and build higher if he stays in the midst of congestion while his business expands.

But have we set ourselves to inquire whether these made-to-order industrial cities, involving

The United States census shows that the number of industrial workers employed in thirteen large cities increased 11.8 per cent from 1900 to 1905. In the zones surrounding those cities, the increase during the same period was 39.4.

all the railroad facilities developed through years of growth, which are at the disposal of a downtown establishment, are at the service of the industry in the suburb. It means much to be within easy reach of at least one large market for finished product. Proximity to a big labor market is a more important factor.

The purpose of these articles, however, is not primarily to discuss the economic causes which lead to the sudden investment of large sums of capital in establishing suburban plants. Their aim is to explore a little way into what the movement means for the great numbers of work people who are caught up and swept out with it. How do these new work places pan out as communities of people living together—families, neighbors, citizens? The census bulletin referred to sums up the industrial exodus in numbers of manufacturing establishments, in value of products, etc. From the standpoint of the common welfare, it should be reckoned also in terms of citizenship and human values. What of health and housing? Of leisure, and income to make

THE ST. LOUIS SATELLITES

#### INDUSTRY ESCAPING FROM CITY CONGESTION

1019 Nearly ten square miles of land adjoining Chicago's southwestern limits, the largest undivided property in Cook County under a single ownership. This is being developed by the Chicago Transfer and Clearing Company as an industrial suburb. On it twelve industries, involving a total investment of \$7,000,000, have sought the advantages of space, light, air and cleanliness not sufficiently available in the congested city center.

living conditions for thousands of people, are so shaped at the outset? In the planning of the great suburban industrial plant, marvelous skill and foresight are shown in adapting buildings and machinery to the processes through which stuff becomes finished product. Is a similar skill and foresight applied to the development of the things through which houses may become homes, a construction camp a community and livelihood life? Apparently the answer is often in the negative.

Whereas in the Gary plant, for example, the utmost ingenuity was shown in scheming out shortcuts, the street planning of the town was on the old checker-board system. The placing of the blast furnaces was dictated by the speed of a laboring locomotive on a curving switch track. Instead of setting the stacks parallel or at right angles to the tracks, they were "placed at an angle of twenty-two degrees, allowing a 200-foot radius for the entering switch." By such careful computations it was sought to avoid the moment wasted, to garner the smallest fraction of a degree of heat which must otherwise be regained. So much for transporting metal. But a workman who lives a mile away from the mill gate has needlessly to criss-cross the checker board streets of the town, for a distance easily calculable by the old formula that the square of the hypotenuse of a right-angled triangle is equal to the sum of the squares of the other two sides. Our general failure to bring city planning to bear where it will count for most—that is, in zones of new construction—was personified in this instance by those middle western officials of the Steel Corporation who, as members of the Commercial Club of Chicago, were at this time contributing from their own pockets toward the \$100,000 fund raised to scheme out in map and design the present magnificent city plan for Chicago; yet as company officials they had not thought to secure the services of an expert city planner to lay out a brand new town which, including the plant, involved an investment of over seventy-five million dollars. The Chicago city plan calls for a cutting of diagonal streets through old territory at enormous expense; the Gary town plan will create in a decade conditions which can only be remedied by a similar Caesarean operation.

The contention is raised, however, by some industrial leaders that they are in the business not of building cities but of establishing mills and factories, that the making of a town is a side matter into which they go only so far as necessity compels them. They want to avoid paternalism. It is significant to hear time and again a frank recognition of the mistakes of Pullman given as a justification for a "do-as-little-as-you-have-to" policy in shaping town conditions. Yet it must be entirely evident that the

Barracks at Gary, showing the sort of cheap sheds put up by real estate speculators to reap a harvest. There are "apartments" in this row for eight families.

early stage of choosing location and of laying the framework of plant and town is crucial. The citizens who are to people the town have not yet arrived. Their very absence imposes a greater obligation upon those with whose fiat goes such enormous power. Through such a serious miscarriage of judgment and stewardship by the company which built Lackawanna,<sup>1</sup> in the outskirts of Buffalo, many of the workers are today housed on stilts in a swampy bottom-land. The efforts of the present administration to overcome the situation in so far as is now possible, illustrate the slow recognition (by a corporation which has learned through experience) that efficiency hangs on health and human well-being and that a mill town in a swamp is as misplaced as a garden patch on a slag pile.

A manufacturing concern which makes highly finished cardboard products recently moved from the center of a large city to its outskirts,

<sup>1</sup>See article by John A. Fitch in *THE SURVEY* for October 7, 1911.

stating as one reason for the change that the smoky atmosphere they had had to contend with caused great damage to the goods. Yet the effect of the same atmosphere on human lungs seemed to have been scarcely thought of, and it was merely one of the fortunate coincidences of providence that what was good for keeping stock clean happened also to be good for the health of people.

The scientific thoroughness which would follow the technique of efficiency and health, down to such details as street planning is illustrated by the drawings for the construction of a large state prison by the Westinghouse, Church, Kerr Company. The firm went to the length of studying astronomical observations to determine the exact angle of the compass at which the building should stand in order to secure in each twelve months the maximum amount of sunlight. If it is worth while to take such care in housing the prisoners of a state, it seems reasonable to think that the same care might also be expended

What town-planning brings within reach of Birmingham workmen. Moreover, the co-partnership scheme of the Harborne tenants shown here enables them to be neither renters all their life nor owners tied down to particular houses in particular towns.

on street plans and the housing of free city dwellers.

"How far we have yet to go in these directions in guiding development with reference to the community as a whole is illustrated by the fact that even at Flint, where a few years ago public-spirited citizens secured a well-known city planner to lay out a scheme involving parks, boulevards and other civic features, one section after another of the industrial quarter has been laid out adjacent to the automobile plants "without any special regulation except the understanding that no street was to be less than sixty feet in width." Corey<sup>1</sup> is the precursor of a planned mill suburb. It seems extraordinary that we do not require in the case of every new subdivision—just as we require of every new tenement house—a careful plan on lines broadly laid down by public authority and submitted to it for approval. The Washington (state) proposal that one-tenth of the area of every such subdivision must be set aside for parks and playgrounds is a step in the right direction. To safeguard the future in old towns as well as new, such broad legislation as is found in the English town-planning act is essential in this country.

The suburban industrial community is, however, something more than a framework of streets. It is compact of life and labor—a community of living beings, and later articles in this series will attempt to set forth its more distinctive human equations. Some general observations and queries may be offered here, not with the promise of answering them all with marshalled facts in the subsequent articles, but with the idea of putting in a loose skein the problems which the factory suburb seems to be weaving into our scheme of civic life. These problems can later be taken up more in detail in describing the representative towns visited.

From an economic standpoint, employer and employe—the plant and the home—are differently affected by the suburban movement.

Removal from the city center, where land values have greatly risen, to the outskirts where land is not so valuable, often means to the manufacturer other gains besides plenty of space in which to secure the most efficient plant arrangement. Indeed, the higher return which may be gotten from the land in the city center is not infrequently expected to defray a large part of the cost of erecting the new plant. It is said that the site of the Corn Products Refining Company in the heart of Chicago cost \$147,000 in 1879, and that as much as \$2,500,000 for it has

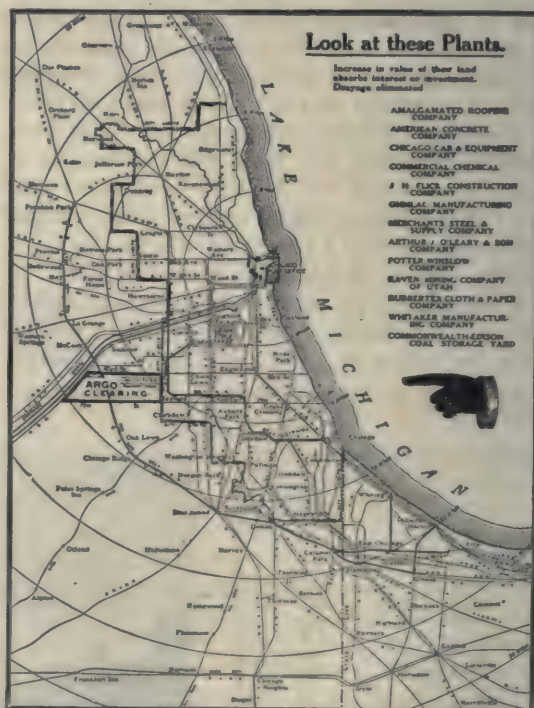

The new industrial center on West 63rd Street

been refused by the company since they moved to Argo in 1908. A railroad president in Chicago has suggested that some of the terminal stations be moved only a few blocks outward from their present locations in the city center and lined up together on one street. He estimates that if the abandoned trackage property is devoted to office buildings and other business purposes, the investment return would be sufficient to pay for the entire cost of the whole series of great new stations. Much of the same thing is doubtless generally true when industrial concerns move out. Yet there is another consideration of large importance. To merely shift railway terminals a few blocks in the center of the city has little bearing on the homes of railway workers. But when a manufacturing establishment moves out into a specially prepared suburb, the cheap land soon begins to rise rapidly in value as workingmen's homes begin to cover it. The question now

Map showing how the Clearing Argo industrial district adjoins the Chicago city limits—taps the belt line railways and holds an advantageous location for the use of Chicago's great sanitary canal should the latter become a deep waterway between the Great Lakes and the Mississippi.

arises whether this increase of land values accrues to the company, to the householders, or—as in the English Letchworth—to the community.

A pamphlet which was distributed by the Pull-

<sup>1</sup>See the Birmingham issue of THE SURVEY, January 6, 1912.

man Company's exhibit at the World's Columbia Exposition in 1893 contains the statement that "the day is not only coming, but is near at hand, when the \$30,000,000 present capital stock of the Pullman Company will be covered, by the value of the 3,500 acres of land on which is built the town of Pullman." That this harvest was being reaped may be suspected from the fact that the company did not relinquish the business of owning and renting real estate until the supreme court of Illinois ordered it so to do on the ground that the company's charter did not authorize it to engage in such business.

Some of the smaller mill towns, especially in the South, suffer through the persistence of this

Billboards employed by the land company to induce people to purchase homes near the industrial plants at Argo.

clination on the part of those who create them to monopolize the land and its increase in value.

Indeed, there is nowadays quite as much danger from the opposite tendency. The "let alone" policy not only lets such matters as city planning go by default, but sometimes throws into the hands of speculating real estate promoters the land values which inevitably come with community growth.

In Gary the land company, subsidiary of the Steel Corporation, explains that in the subdivision which it developed, the purpose has been to sell land and houses to employees at prices scarcely more than the original cost of the land plus improvements and interest charges. In the six years of Gary's existence, the land company has only once, and that recently, advanced the price of lots and houses. This presents a pleasing contrast with the booming operations of some real estate speculators who are to be found in other subdivisions of Gary and in the general run of satellite cities.

Yet home ownership, which such a policy promotes, may often be a very doubtful advantage to the workingman. The land value created by the community is dependent upon the permanency of the community, and this is dependent upon the existence, stability and growth of the industrial plant. In a large city if one plant runs slack or is abandoned, there is likelihood of compensating growth in another plant. In the satellite city, as in a mining town, the home owner is often at the mercy of the vicissitudes of a single industry.

To illustrate: Cherry is an isolated prairie town surrounding a mine shaft. Everything in the place depends upon this one source of wages. Before the disaster of 1909 many of the thriftiest men had put their savings into homes. Had it not been for relief funds their widows would soon have had to move where they could get work to support their families. The homes would very likely have been sold at only a small fraction of the amount invested in them. When, too, a mine town is suddenly abandoned because the company finds that the vein is exhausted or can no longer be profitably worked, the same loss of investment in homes occurs. The small manufacturing community dependent upon one concern may as suddenly become a deserted village if an invention displaces the product manufactured, or if an industrial combination is formed and decides to discontinue the local plant.

## The Clearing-Argo Industrial District.

The largest unobstructed property in Cook County under a single ownership, extending from Forty-eighth Avenue to the Sanitary Ship Canal, between Twenty-third and Twenty-ninth Streets. Over 5000 acres to be covered with factories, railroad yards and warehouses.

The Chicago Transfer & Clearing Company, which has undertaken the development of this property, has a capital investment of four million dollars, all paid in and represented by tangible assets and no outstanding indebtedness. The company will erect this extensive territory with factories and homes for the employees. If you buy from a company which can build up a big manufacturing center in order to make a profit on its investment, your interests are the same as those you see a partner in the success. Think this over.

### A Big Project.—Started by a Big Company On a Big Tract of Land

Here are located the great Chicago Railroad Yard, three and one-half miles long, containing over 100 miles of track. Connecting with them and passing through the District are all of the Chicago Rail Lines and through them connection is made with every main line entering Chicago. These yards furnish superior trucking facilities to the many factories in the District. A complete sanitary sewer system, draining the entire District and costing over \$1,000,000 and a large pumping station which by siphon pump water from across yards for private and factory use have been built. A complete electric plant has been installed, supplying current for power and lighting. Green walks have been put in. Streets macadamized. Roads and school house built. All these improvements are the best of their kind. A new extension of the Forty-third street car line has been completed, connecting Clearing and Argo and forms the last link of a continuous line from Jackson Park to Archer Avenue.

### Ship Canal Here.

Consolidating largely to the future growth and development of the District is the great Sanitary and Ship Canal. A large factory along this has been acquired by the owners of the District and preparations will be made for dockage and lightering service. The importance of the Ship Canal to the industries already established and to be located here can hardly be overestimated.

### What we have done.

We have already located in the District twelve industries, with a total investment of \$7,000,000 that now give employment to about 2000 men. They are:

Amalgamated Roofing Company	Fitch Construction Company	Pattin-Window Company
American Concrete Company	Mechanical Steel & Supply Company	Rayne Mining Company
Chicago Car & Equipment Company	Quincy Manufacturing Company	Rabbiner Clark & Paper Company
Commercial Chemical Company	O'Leary, Arthur J. & Son Company	Whitaker Manufacturing Company
Corn Products Refining Company		

Two million dollars will be expended by the Corn Products Refining Co. in the next year on additions that will increase the number of employees by fully 600. When this great plant is completed 3000 hands will be required to operate it and with the additional operations needed to handle the material and product the total number of employees will be greatly increased.

### Working Men Attention.

Here is another chance to secure at the start in a great industrial community where the developments will be quick and sure.

policy along with other almost feudalistic company powers. But the present developments in establishing satellite cities show less of an in-

INDUSTRY SEEKS THE ADVANTAGE OF THE OPEN PRAIRIE

Will the same advantage be as skillfully utilized for the home life of the people? These fields around the Argo plant of the Cerris Products Company are within the five east Chicago street car lines.

#### INDUSTRY IN THE GRIP OF CITY CONGESTION

Former plant of the Corn Products Refining Company. It reached back as far as the tall chimney where it bordered on the Chicago river. The north boundary at the left of the picture is Taylor street. In the background in the center may be seen the Blackstone Hotel on the lake front. The miserable housing in the lower left-hand corner contrasts with the opportunity for a garden suburb on the prairie surrounding the present plant at Argo.

#### THE GREAT CLEARING RAILROAD YARDS

These yards are three and one-half miles long and contain over one hundred miles of track, and through belt lines connect with every trunk railway entering Chicago. Eventually, it is expected that practically all through freight will be handled here, thus completely avoiding its haul into the Chicago terminals. Will as much imagination and planning go into the human currents of the suburban industrial communities as into these freight arteries?

This risk in home ownership lurks in some degree in almost every satellite city. A safeguard, however, has been experimented on in Gary. The contract of sale between the Gary Land Company and the workman purchasing real estate gives him the opportunity at any time of selling the house back to the company for the same amount which he paid for it, less a sum—to cover interest, depreciation, etc.—totaling little more than what rent for the period would have been. As a matter of fact, the home owner in the steel company's subdivision can, as things stand today, sell out at a substantial profit to outsiders who are desirous of securing homes. The housing accommodations in Gary

commute out into the country and back each day. A similar situation exists at Norwood and Oakley, near Cincinnati. The failure of work people to move their homes out to the neighborhood of the plant may in some cases be due to high land prices set by the owners of real estate. Or perhaps other members of the same family work "down town," and so the family continues to live in the congested center. Desire of youth to be near the amusements, the lights and the crowds—where "something is doing" all the time—is another factor.

Metropolitan advantages, it may be noted in passing, have attractions for the better-to-do also. Miss Byington has pointed out, in discussing the

AT GARY

AT ARGO

A saloon-keeper who got in on the ground floor at Gary was shrewd enough to seize the same chance at Argo. Like camp sutlers, traffickers in recreation and refreshment are quick to follow in the trail of industry and put the commercial stamp on the social life of the place.

thus far are inadequate, and the interurban service brings many workmen in who live elsewhere. A considerable number even make the trip from Pullman to Gary and back each day, a distance of over twelve miles.

Transportation is a many-sided factor in the industrial suburb. It may tend to reduce the risk in home ownership if houses can be conveniently occupied by people who work in nearby towns. It may also broaden the opportunity for work, already discussed, for it may relieve the local industry from being the sole dependence.

Transportation facilities between large cities and their industrial suburbs vary widely. Sugar Creek lies a mile and a half beyond the end of the nearest Kansas City street car line. But traction service of at least average quality connects South Omaha with Omaha, and Norwood with Cincinnati. Not a few of the workers in the packing plants in South Omaha live in Omaha proper, since they can easily reach their work on the street car. A publishing house which moved its plant out of New York to a beautiful location near the Hudson River, finds that most of its employes do not change their residence, but continue to live in New York, and

influence of transportation upon the social life of Homestead, twenty-six miles up the Monongahela, that it is both too good and not good enough. It is so good that the Homestead people who earn the largest incomes and have the shortest hours are able to go to Pittsburgh for concerts, entertainments and social gatherings. Yet it is not good enough and cheap enough to enable the rank and file who have least to spend and work long hours, to have the same advantages. Meanwhile, because of the proximity to Pittsburgh, there is no demand from the very people who would otherwise tend to establish the general recreational facilities of a town of 25,000, and who might lead the social and civic life of the place.

Recreation and social life may need quite as much, if not more, wholesome opportunity and promotion in the industrial suburb, with its isolation and its sudden massing of strangers, than in the city center with its longer established neighborhoods and its greater facilities. Schools, libraries and other civic institutions are criteria by which to gauge the standard of community life. Adequate provision for them may be of business value to the suburban plant management

Intemperance, immorality and general shiftlessness were said to be more prevalent and deep-seated in these South Omaha poverty stricken families than in similar families in Omaha.

Home ownership and arrangement of part time work are not the only factors which are sometimes counted upon to control the currents in an industrial community. Some company officials act on the belief that by removing workmen from a large city it is possible to get them away from the influences which foment discontent and labor disturbances. The satellite city is looked to as a sort of isolation hospital for the cure of chronic "trouble." In an eastern city which recently experienced the throes of a turbulent street car strike, the superintendent of a large industrial establishment frankly said that every time the strikers paraded past his plant a veritable fever seemed to spread among the employees in all his work rooms. He thought that if the plants were moved out to the suburbs, the workmen would not be so frequently inoculated with infection. The experiences of Pullman in 1894 and Lawrence in 1912 are, of course, against this conclusion; but the question remains an interesting one to explore; how far does the removal of work people from big centers of population break up the cohesion of their industrial organizations? The suburban trend, if it continues, may thus have an important influence on the industrial relations of the future.

It is equally important to know whether, in these towns of their own creation, the industrial interests seek to dominate the local government. Will people assert themselves as citizens when their interest runs counter to those to whom they, as workers, look for a livelihood? On the other hand, in these towns the industrial power can be more clearly singled out than in the complex metropolitan center, and Professor Ely, in making a study of Pullman in 1885—but four years after the town's beginning—found that already a feeling had arisen that it was a praiseworthy thing to "beat the company." At Gary one feels that friction and antagonisms between townspeople and the industrial control are always just under the surface if not cropping out. The town of Steger, where pianos of that name are manufactured, has recently undergone a controversy of the most acrimonious sort between the firm and citizens who

charged despotic exploitation of the sort alleged at Pullman. At Leclaire, the town founded by the firm of N. O. Nelson relations seem to have been harmonious. The election not long ago of a socialistic alderman in Granite City, and a socialist mayor and other city officers at Flint is to be weighed against elections at Gary, whereby six saloonkeepers became members of a board of nine aldermen.

The politics of the satellite city have a bearing also on the large center near which it is located. Its vote, for example, might turn the tide of the whole district of which it is a part for or against the candidates who represent the newer policies for assuring popular control of government. More important still, many industrial suburbs will probably be absorbed sooner or later as sections of the metropolitan city. Pullman, for example, may be said to have completed a cycle upon which later industrial suburbs are only now starting. It has for several years been a part of the city of Chicago. Just what has Pullman contributed to the greater city? Does its town plan fit in with the great city plan recently formulated for the metropolitan district? What peculiar problems, if any, does it inject—of health, housing, recreation—into the well-being of the whole city? What sort of aldermen come from Pullman to the city council? These and other phases of the present-day estate of this, the first and perhaps most widely known, industrial suburb will be discussed in my next article.

The industrial exodus, in which Pullman early played the rôle now taken by Gary, is, in its individual parts, a consciously directed movement. It therefore presents repeated opportunities for shaping the civic and social conditions under which large groups of working people are to live for decades to come. It raises in new and searching ways questions as to the obligations which go with economic control; as to the future of local self-government in relation to the same; and as to the organization and large-scale civic development of our industrial districts.

Like the foundlings which were dropped in the turn-cradles of the old time orphanages, these young communities which industry is leaving at the door-steps of our cities are no longer things apart and by themselves. For better or worse, they come to share in the common lot.

In our treatment of the insane there have been distinct eras—that of demoniacal exorcism, of fire and scourge; then that of chain and dungeon; the monasteries and the asylums patterned after them; today the psychopathic hospital and the agricultural colony.

In the tiny villas which embody the century-old dream of two French doctors and in the cottages and spring houses in which the Japanese for a thousand years have worked out a system of care, Dr. Peterson finds suggestion for America.

AN INNER OR COURT GARDEN AT IWAKURA

Ever since the third daughter of the Japanese Emperor Gosanjo in the eleventh century developed melancholia, Iwakura has been a colony for the insane. In 1889 the village had 239 cottages for patients, with 1,579 inhabitants. Each little house has its own idyllic charm, expressed in simplicity of architecture, harmony with the landscape and well studied gardens. Across the spotless verandas one looks out upon shrubs flowering for every month between the winters, upon the plashing fountains with their gold fishes, into the restful gloom of the giant cryptomeria woods on the one side or to the evergreen hills upon the other.

GENERAL VIEW OF IWAKURA

Lying at the foot of great hills in a wide valley, Iwakura is surrounded by giant forests through which run beautiful old paths. Several imposing old temples stand out among the spruces and cedars. In 1889 the Japanese government, misled by a false estimate of the value of our western methods of carling for the insane, concluded that their colony system that had grown up so naturally was too unlike the colossal caravansaries in Europe and America. An edict forbidding that insane be any longer taken to Iwakura has reduced temporarily the number in the colony. The West may some day be glad to copy this Japanese model.

#### A COTTAGE FOR PATIENTS AT IWAKURA

# FROM VANVES TO IWAKURA

FREDERICK PETERSON, M. D.

PROFESSOR OF PSYCHIATRY AT COLUMBIA UNIVERSITY, EX-PRESIDENT NEW YORK STATE COMMISSION IN LUNACY

THE evolution of our modern methods of caring for the insane has been marked by certain successive stages which may be briefly epitomized thus: There was first the era of demoniacal exorcism of the Middle Ages when the insane in Europe were subjected to various kinds of torture—by fire, submersion in water, scourging, and so on—in order to rid them of the evil spirits with which they were supposed to be possessed. This was doubtless done in all kindness and for therapeutic purposes, for demoniacal possession was the accepted theory of the cause of insanity in that day. The second stage may be called the chain and dungeon era of the seventeenth and eighteenth centuries when the insane were locked up in jails and prisons with felons for their own and the community's protection, and chains and dark dungeons were in common use alike for the restraint of criminals and the insane.

Then with the gradual awakening of public intelligence to this wrong came the era of special asylums for the insane, when they were removed from the prisons and for want of better structures for their immediate needs were gathered into the vacant monasteries of the time. These were being abandoned very often in that day and could readily be adapted to such new use. Later as the need for more asylums grew, and the supply of monasteries gave out, the architects of the period naturally followed the prevailing monastery style of architecture for the new institutions, having no other models to determine their plans. This monastery style of architecture for asylums for the insane prevails in most countries to the present day, though departure from it is increasingly frequent, in line with improving conceptions of methods of caring for the insane. For instance, the general hospital idea has had some influence on new designs, which sometimes follow the schemes of large general hospitals, or pavilion or cottage plans. The special psychopathic hospitals in cities, particularly those in connection with university medical schools, are a radical departure in asylum architecture, embodying the best modern ideas of safe custody, proper surgical and medical care, scientific study and investi-

gation of insanity, and the instruction of medical students and practitioners in psychiatry.

The agricultural colony idea, too, as applied to the care of the insane, is the outcome of a gradual evolution in method, but, though the ideal scheme for every country asylum, exists only as an ideal in this country, and there are but few examples in Europe. Some day every city of over 200,000 inhabitants will have its psychopathic hospital within the city limits, and a colony for the overflow in the country nearby, modeled on the Alt-Scherbitz colony for the insane near Leipzig, or upon the Craig colony for epileptics near Rochester, N. Y. And every small city with a general hospital will have a psychopathic ward or department for the reception and treatment of emergency cases of insanity, instead of utilizing station-houses and jails for the purpose. It is hard to shake off the old idea of a century or two ago of something common between felony and insanity. The sooner we recognize that insanity is a disease, having in the main as little to do with penal offenses or legal procedure as a fractured skull or a delirium from typhoid fever, the better will it be for the insane. We are just beginning to do this. As the world has grown better and our humane intentions have gathered force, we have nearly reached the point of looking upon the insane as sufferers from disease and not criminals, and upon the problems of insanity as chiefly medical and social and not punitive and legal.

But we are certainly too complacent in recording our achievements so far in the care of the insane. We have improved, but we have not done well enough. In many states the condition of the insane is still far from ideal; in fact, but little better than that of the inmates of the Salpêtrière before Pinet in 1792 struck off their manacles and chains. Even in states where the most has been attained, such as New York, the problem of their care has become so vast, complicated, and unwieldy that the need for proper direction and supervision, now so sadly lacking, in order to insure further progress, grows every year more urgent. The individual is lost sight of in immense aggregations of patients. They now number in New York state 32,000. Asylums with 3,000 to 5,000

inmates are surely an anomaly in any well-considered standard of care. The overcrowding is appalling. The nursing is inferior and inadequate. The medical staff is always too small and medical care therefore defective. The occupation treatment is merely tentative and rudimentary compared with what it ought to be. There should be large acreage for all kinds of horticultural and agricultural work, with complete separation of the patients in small colonial groups, and many special instructors in sloyd, arts and crafts, etc.

In many of the licensed private asylums the standard of care and treatment is not nearly equal to that of the state hospitals. The lack of emergency hospitals for these cases, or psychopathic wards in general hospitals, has led to the use of jails all over the state as stations for first care of the insane. Can we by forgetting this apparent chaos of detail into which the lunacy problem has grown by sheer force of circumstances, and seldom by intelligent direction, get back to some sort of basic first principles that should guide us in the treatment of a curable patient with a sick brain? For the sake of clearer understanding let us take a patient with moderate delirium. In such a case the senses are alert and hypersensitive but tend to misinterpret and pervert what they perceive. A first principle in treatment therefore would be isolation in a tranquil environment. It would be a violation of this first principle to place the patient in a ward with thirty or forty others as delirious as himself, or to put him alone in a room with bare or padded walls, locked doors or barred windows, because of the unhealthy suggestions these would offer. This brings us to a second principle of treatment, viz., psychotherapeutic suggestion. It is obvious that all suggestions to the disordered senses should be not only normal and rational but tranquilizing. The friendly face and kindly assiduity of a good nurse and a pleasant room with plenty of sunlight and fresh air, overlooking a quiet garden would realize this type of suggestion. When the patient grows strong enough to leave his bed and to occupy himself, occupation being one of the best of therapeutic measures, he should have a small garden for his walks and labors. In addition to gardening there should be available all sorts of arts and crafts with which to busy his hands, and these are curative in direct proportion to their novelty, utility, and creative character. The physician in charge should have ample time to devote to each such patient, and the nurses should be especially selected for their skill, intelligence, patience, and sympathy.

How far removed we are from these elementary principles of care and cure of the insane is all too evident in even a casual visit to the average modern asylum. It looms colossal and

forbidding before the eye with massive door and grated windows. Before the sick person can enter this so-called hospital he must be legally declared insane and indeterminately sentenced to seclusion by a judge. If he be very delirious he is carried through many winding corridors and wards to the remotest part of the building where the noisy and violent are placed together, thirty to forty or more in a ward. As he grows quieter he proceeds from one ward to another until he reaches the convalescent ward. The wards are overcrowded. Sometimes beds are so close together that to get into his bed he must climb over the foot of it. I have known of mattresses laid upon the floors in hallways, bathrooms and even in toilet rooms to accommodate the overflowing wards. Exercise out of doors is apt to be taken at fixed hours in a march around the grounds, double file in columns of 50 to 200 with attendants as guards at each end and along the sides. A few trusty patients are worked on the farm and about the grounds, and some make scrubbing-brushes and pick hair for handicraft work. Some make beds and drag a heavy floor-polisher through the wards and corridors. But the great majority sit idle and listless in long lines throughout the wards the entire day.

The attendants are attendants, not trained nurses, and as they are scantily paid are apt to take up this calling as a last resort when there is nothing better to be found to do. They are prone to leave as soon as something better offers, so that they are constantly changing, and there are scarcely ever enough of them to fill out even the quota allowed by the state, viz., one attendant to ten or twelve patients. On the whole they are surprisingly good, especially in country asylums where they are drafted from among the farmers' daughters and sons. They are of a distinctly lower type in the cities. The average attendant is like the average man or woman with average honesty, average kindness, and average humanity. There are many far above the average, indeed some truly noble, heroic, tender, intelligent, ambitious. There are also some below the average, coarse, ignorant, vicious, brutal. Careful selection is practiced as far as it can be done with the heavy handicap of poor pay and few applicants. There are never enough physicians, rarely more than one to two hundred patients, and no one physician can do justice to the needs of so many, and the poor pay together with the trying and arduous labors and the isolation of their lives tends to keep the better class of physicians from going into the service, so that the highest types of medical men are growing gradually fewer in asylum work.

In connection with these statements here are some facts given to me while writing this by

the superintendent of one of our fourteen or fifteen New York state asylums:

The overcrowding increased without adequate remedy at my hospital until last winter we were not only occupying corridors and day rooms (with beds), but in some of the small sitting-rooms we had gotten down to less than 300 cubic feet of air space per patient. . . . We ordinarily have about fifty appointments a month among the lower employes (owing to insufficient compensation), and on my medical staff I have had twenty-nine changes in one year,

pert commission appointed to study and solve it. This should no longer be left to politicians.

As a contrast to this picture of the usual methods of care in vogue all over the world it will be interesting to turn to two departures from them which seem better to fulfill the ideals expressed in the early part of this article. In the course of my travels I have discovered two remarkable institutions for the insane, one in France and one in Japan. They deserve to be generally known, both for their uniqueness and

IN THE SUBURBS OF PARIS

This farmstead divides the *Maison de Falret*, a villa for the insane at Vanves, into two parts, one for each sex. The whole park contains over sixty acres and combines many of the essentials in the care of the insane—the return to nature, adequate nursing, out-of-door work and segregation from other insane.

including appointments, resignations, promotions, and transfers, and on a staff of say about twenty-four physicians there are only about four or five who have been here over two years. I shall soon have vacancies for nine physicians and really suitable material is hard to get.

In the majority of the private asylums, especially the cheaper ones, conditions are not so good as in the larger public institutions. The problem of the efficient and humane, as well as economic, care of the insane, is becoming so enormous, serious and complex in every state that it will soon be important to have some ex-

per for the wholly different standard of care they represent.

Nearly one hundred years ago two distinguished specialists in insanity, Doctors Voisin and Falret purchased an estate of over sixty acres in the environs of Paris and transformed it into a park which they planted well with trees and shrubs. A pretty stream courses through it. In this they built numerous tiny villas or bungalows, each with its own little garden, surrounded by high green hedges, each garden opening by its own gateway into the larger park. Now

PAVILLON DE LA SOURCE

Two of the twenty-seven bungalows at Vanves for the isolation of one or more insane patients. These buildings, together with the park surrounding, embody the dream of the distinguished French specialist Falret, and Dr. Peterson calls this the best plan for the care and treatment of insane which our western civilization has yet devised.

PAVILLON DU POMMIER

after the lapse of a hundred years it realizes their dream of what should be done for the insane. The Maison de Falret, as it is called, at Vanves, in the suburbs of Paris, consists of a large park full of magnificent trees and shrubbery, divided into halves by a farmstead group of buildings, thus making practically two parks, one for each sex, and there are twenty-seven such bungalows for the isolation of one or more patients. Paris has grown up around it, but wandering in this estate one can scarcely conceive a vast city to be so near. A patient brought here is not only isolated from his friends which is usually a distinct advantage, but he is isolated from the insane which is an even greater gain. There are perhaps a hundred patients here. We have in this plan all the essentials for the care of the insane, adequate nursing, segregation from the other insane, the return to nature, the simple life, a practical out-of-door life for night and day, beautiful surroundings, association only with normal persons and plenty of space for walks, for working in gardens and fields and at various arts and crafts. The dream of Falret is here realized, and it is the best that our western civilization has yet attained in the matter of care and treatment of the insane.

I had the good fortune to be conducted to Iwakura by Professor Imamura of the Department of Psychiatry in the University of Kyoto. I was the second westerner to visit this remarkable place, the first having been Professor Stieda of Russia who described it as "the Japanese Gheel" in 1906. Iwakura is a little village about seven miles from Kyoto and had this origin:

The third daughter of the Emperor Gosanjo in the eleventh century developed melancholia in her eighteenth year. News was brought to the imperial household that at Iwakura was a holy

well, the water of which was healing to mental diseases and to disorders of the eyes. The emperor's daughter was taken thither and recovered there nearly nine hundred years ago, and so brought fame to the temple and well of Iwakura, as a result of which the insane were attracted there in great numbers. At first three small inns were constructed to receive them, then later tea houses and villas and cottages sprang up in which to provide for the ever-increasing influx of patients.

In the year 1889 the village had 239 houses, with 1,579 inhabitants, and up to that year one or two patients were received into each family to share in the occupations of the household which were chiefly out-of-door employment in fields, gardens and parks and some of the arts and crafts of the ordinary Japanese home.

Iwakura lies at the foot of great hills in a beautiful wide valley. The hills are covered with evergreen cryptomerias (a kind of giant cedar) and with pines and spruces, while every available part of the valley is cultivated with rice and vegetables, bamboo and lotus. Each little house has its own idyllic charm. This charm lies in its simplicity of architecture, harmony with the landscape, and its well studied gardens both inside the courtyard and outside around the house. The paper windows and sliding paper walls insure light and air and a practical out-of-door life night and day. From the spotless mats upon the floor, across the spotless verandas one looks out upon the garden green with pines and cedars all the year round, filled with flowering shrubs for every month between the winters, upon the plashing fountains with their gold fishes, looks out into the restful gloom of the giant cryptomeria woods on the one side or across the valley of rice fields to the evergreen hills upon the other. There are beautiful old

paths and roads among these cedar forests and several imposing temples among them.

In 1889 the Japanese government, misled by a false impression of the value of our western methods of caring for the insane, came to the conclusion that their colony system that had grown up so naturally was too far removed from American and European standards, as exemplified in our colossal caravansaries for the insane, and so by edict forbade the insane being any longer taken to the village of Iwakura. They abolished their own method as probably barbarous, just as at one time they abolished cremation, having been persuaded that it was a heathen practice, but returned to it when they subsequently learned that cremation is the goal to which western civilizations are tending.

The result of this opposition of the government has been to reduce temporarily the number of insane in the colony. It is altogether likely that as soon as the authorities realize that their own system, evolved in a period of nearly a thousand years, is the best of all methods of

caring for the insane, they will gradually remove the proscription, and restore Iwakura to its ancient rights and privileges under state supervision and inspection.

No doubt we in the West will some day be glad to copy this Japanese model when we finally awaken to how far we have drifted from an ideal system of care and treatment of the insane, with our immense, expensive and complicated machinery of mere support and custody. We may in time follow this plan of simple construction and arrangement of grounds and buildings, but shall we ever, alas, attain the same degree of perfection in the morale of the nursing staff? This was to me the most striking feature in the care of the insane in the various asylums of Japan. I believe such gentleness, kindness, patience, and assiduous attention to the sick could be found nowhere else, for nowhere else exists a whole race of people who never scold, quarrel, or manifest impatience, but always turn a smiling face and extend a helpful hand to one another.

## SOME SOCIAL AND ECONOMIC RESULTS OF THE REVOLUTION IN CHINA

EARL H. CRESSY

CENTRAL CHINA FAMINE RELIEF COMMITTEE

"I HAVE finished the political revolution and now propose to devote myself to inaugurating the greatest social revolution in the world's history."

Such is the reason for his retirement given by Dr. Sun Yat Sen, who more than any one man is responsible for the formation of a republic in China. Unhampered by the forces of conservatism incidental to a gradual change, China aspires immediately to utilize to the utmost the experience worked out by the West. Only now have the older republics become aware that political democracy is only a beginning. China is awakening to the fact that if popular sovereignty is to endure, it must not only be political, but industrial and social.

Dr. Sun adds: "The future policy of the republic will be keen socialism."

The outstanding feature of China's economic past is the emphasis upon agriculture. Farming has been insisted upon as the exclusive industry of the masses of the people, to the extreme of making it a matter of morals and even of religion. This dates from the time of the prehistoric invaders who discouraged the pastoral pursuits of the conquered people, cut down the forests and devoted the country to agriculture.

That the economic spirit of the country has changed little from that day to this is evidenced by the following quotation from the Sacred

From *The Changing Chinese*, by Edward Aisworth Ross. The Century Co.

WORKING A YANGTSE JUNK WITH OAR AND SWEEP.

Edict, promulgated by the first Manchu emperors, which has stood as an epitome of the requirements of good citizenship in China:

The basis of the people's support consists in the two items, food and clothing. True, there are scholars and farmers, artisans and tradesmen; each has his different occupation; but after all the supply of these necessities depends solely upon husbandmen and the cultivators of silk-worms. If every man in the whole empire set about cultivating his own land, each one growing what he ate, in all the land no one would suffer from hunger. If there were one who did not till his field, just that one would lack food.

The present industrial situation may be traced in large measure to this cause. The deforestation of the country has changed both the surface and climate of North China, and has made

nation of China has been the misgovernment of foreign dynasties, particularly the Manchu. The early Chinese emperors built canals, dykes and great systems of roads that could stand comparison with those of Rome, and the last Chinese dynasty, at least, permitted mining, if it did not encourage it. During the centuries of Manchu rule the roads have almost wholly disappeared, many canals have fallen into disrepair, and where commerce has still survived, official greed has bled it by numerous "likin" or customs stations. The neglect of the dykes, built to control the rivers as deforestation proceeded, has reduced some of the most fertile areas in the world to a deplorable condition. The Manchus forbade the opening of new mines, discouraged the working of old ones and by their hatred of foreign innovations obstructed the progress and industrial welfare of the nation. Such conditions were the fundamental cause of the revolution. With the passing of the Manchus, the new China is left free to work out economic reform; but that all abuses should vanish along with the reigning family is too much to expect.

The social result of all this is that the masses of the people live on the margin of actual want. As they are so largely dependent upon agriculture, a single bad year is often sufficient to reduce them to starvation, while the lack of a broad market and of a diversity of industries gives them nothing to fall back upon.

Such are the present conditions. The largest factors in the progress of the new China will be railroads, industrial revolution, conservation and development of natural resources, establishment of economic justice and religion.

Railroad building is a political necessity. Unity and a national consciousness can come only with intercourse. Up to the present the provinces have been practically independent satrapies, and there is a line of cleavage between North and South. Without railway communication, the integrity of the country must remain uncertain. The nationalization of the railways seems to be desirable, and the through trunk lines must be under the control of the central government rather than of the provinces. In the spring of 1911 this issue was clear-cut, and the railroad riots at that time were due to the efforts of the central government to take the Hankow Szechuen railroad out of the hands of the provinces.

The results of the linking up of all parts of the country by rail will be revolutionary. The condition of the agriculturalist will be greatly improved, for cheap transportation will steady and broaden the market. The undeveloped commercial possibilities of China are enormous. All the railroads have paid from the start. In America the roads built into the wilderness and then

*From The Changing Chinese, by Edward Alsworth Ross. The Century Co.*  
CAVE DWELLING OF A COAL MINER

famine chronic throughout vast areas. Such an agricultural policy implies isolated district or community units, each supplying its own primary economic wants, and needing little intercourse with the other units. Politically this has been the case, and so long as taxes have continued to come in, the motto of the central government has been to let well enough alone. Such conditions have retarded internal commerce, and because of the lack of communication, the greater part of the country has only a limited local market available. Grain has more than once been a drug on the market when people were starving by communities within a hundred miles, and this past year the Famine Relief Committee has purchased large portions of its grain upon the borders of the stricken area.

The other chief reason for the industrial stag-

carried the settlers on whose business they were to depend; but in China, teeming populations tax the resources of the line from the first day. Imports and exports doubled in twelve years after the inland steam navigation ordinance of 1898.

The industrial revolution is already under way in China. For centuries there has been a considerable division of labor and many of the arts have been carried on with a high degree of skill, but production has been on the shop system, and is conducted on a family basis. The change from the shop to the factory system will be the more difficult, because it must come all at once. The experience painfully worked out

in a meeting of Chinese stockholders when in the face of heavy losses due to the revolution, a 10 per cent dividend was voted. One of the vices of Chinese management is the neglect of upkeep. Everything in China appears to be going to rack or ruin, and plants are allowed to deteriorate, while the funds that should be used in repairs are paid out in dividends. Such conditions will make it even more possible than it was in America for those who first master the new machinery of business, to manipulate corporation securities and build fortunes before the people awaken to the danger.

The human horrors of the industrial rev-

From *The Changing Chinese*, by Edward Alworth Ross The Century Co.  
BURNING OF OPIUM PIPES AND OTHER PARAPHERNALIA CONFISCATED BY THE  
FOOCHOW ANTI-OPIUM SOCIETY (EIGHTH TIME)

by the West during a century is being taken over by a people whose previous training has in no way qualified them to grasp its significance. The country is strewn with the wrecks of ill-advised industrial enterprises, such as the glass factory in North Kiangsu, where it turned out that the sand would not make glass, or the carriage factory built in an inaccessible portion of Szechuen.

Even more difficult is the transition from the small business, which was a family affair, to the corporation which the modern scale of production demands. No Chinese corporation has as yet been a complete success. The reason is made apparent by such action as that recently taken

in other lands are being repeated and magnified here. It is stated on good authority that of all the big cotton mills in Shanghai only one allows as long as fifteen minutes for lunch at noon. In the rest, the women work from early to late, often with babies in baskets at their feet, and eat while tending the looms.

The earnestness of the Chinese government concerning conservation is indicated by the action of the national assembly when in cutting down the number of departments in the cabinet, the department of forestry and agriculture was retained, although others of great importance were made subordinate. Assurances have been repeatedly given that when the six nation loan

*From The Changing Chinese, by Edward Alsworth Ross. The Century Co.*

#### A POTTERY—THE WALLS BUILT WITH DEFECTIVE POTS

goes through a large amount of money will be used for work of famine prevention. The conviction is growing both among Chinese and foreigners who have been in touch with the work of famine relief, that the time has come to make an effort at securing government action on a scale large enough to prevent the recurrence of famine. One of the means to this end will be the development of a public sentiment which will insist on prevention rather than cure—upon economic justice rather than charity.

It is possible for China to build railroads, open industrial plants and greatly increase the material resources available, and have all of this count for very little in real civilization, unless some means is devised whereby the masses of the people and not merely a few shrewd individuals benefit thereby. The thing that above everything else China needs to learn is the lesson of brotherhood. It has taken the nations of the West many long and bitter years to come to an understanding of the ethical relationships demanded by the new industrial order. This experience, as far as it goes, can be made available for China. One of the greatest needs at present is for a careful study of social conditions with a view to adapting for use in the Orient the lessons learned in the West.

In this connection all agencies that tend to bring the East into touch with the ethical and religious life of the West are of the utmost importance. The foreign concessions in the treaty ports of China are giving illustration of the modern administration and improvement of cities, and, while this is often marred by a lack of altruism, it cannot fail to have

far-reaching influence. Contact with western business methods leaves much to be desired, but it has its beneficial side also. The most influential factor in this direction, however, is undoubtedly the missionary body which is represented in practically every center of importance.

Probably the most significant thing about the missionary movement today is the increasing socialization of its work. Education and medical and literary work are recent additions. Famine relief has thrust itself upon the missionaries and the conviction is growing that the bearer of the Gospel message must not fail to face the economic problems of his field.

Although many missionaries are taking an active interest in different aspects of the social problem, they are in only a few cases men who have special training along that line. One of the most pressing needs at present is for men of thorough training in social science to come to China. The greatest danger is to be apprehended from the indiscriminate copying of western methods and ideas by the Chinese without regard to their applicability to the Orient. First must come the study of existing conditions; then the mapping out of policies for social and economic readjustment, and finally the training of Chinese who may be able to carry these things into effect. The field is a tremendous one. The changes that are taking place are vast and will come with great rapidity. To the social specialist who is ambitious to exert a far-reaching influence for the betterment of mankind, and to those who desire to invest money where it will bring the largest return in human welfare, the present situation in China offers an unparalleled opportunity.

#### HOVEL ON BEACH AT KIUKIANG. OVER THE DOOR THE CHARACTER FOR "HAPPINESS."

# THE DIVINE CALL: FOLLOW ME

ALBION FELLOWS BACON

SECRETARY INDIANA HOUSING ASSOCIATION    AUTHOR PRESENT INDIANA HOUSING LAW

CHRIST saw Peter and Andrew, James and John, at their daily work, and he said, "Follow me." And they left all and followed Him. Along the seashore, through the country-side, from town to village, over desert wastes, up mountain steepes they followed Him. For three years they had His constant companionship. I want you to realize what that companionship must have meant.

To many, religion is a tiresome thought. They are afraid Christ would be a bore. The God they have created *would* be as stupid as any god the heathen have made of wood or stone. But I wish I could show to them what stimulation and delight there is in the company of the real Christ; that if we could take all the good comrades, the brilliant thinkers, the interesting travelers, the deep students, the poets, artists, and inventors, and the tenderest of friends, and put them in one, we would not have so enjoyable a companion as Christ.

We have all had moments with some great person that we never forget. They stand out like glowing mountain peaks against the rest of life. And we have been with some saintly one whose presence is a benediction, through whose eyes we have looked upon eternal things, until the littleness of our own lives dropped away from us. We think what a privilege it would have been to have had an hour in the company of Dante, of St. Augustine, of David, of Moses. But here was a man whose personality had such an irresistible charm that at His "Follow Me" men forsook all.

We know the comfort of being with some one who understands us. Here was one who read the thoughts of men, and saw the good motive, even when the deed failed; who knew all their temptations and their struggles and their hindrances, who was above all petty standards, and judged with righteous judgment. One whose face was so radiant with love and sympathy that little children left their mothers and came to Him. Sinners were not afraid of Him and the wretched and needy pressed to touch His garments.

We give almost superstitious reverence to the names of Michael Angelo, Mozart, Händel, any of those great interpreters of beauty. But here was the very Creative Spirit, who was with the Father when the worlds were made, when

the firmament was arched and gemmed, when the mountains were piled up and the mighty seas outspread, when the secrets of the prism and the octave were made manifest in all the harmonies of color and sound, and one was told to the clouds and the flowers, and the other to the winds and the waves and to all the daughters of melody. He who was the Way, the Truth, and the Life was also the Soul of Harmony and the Spirit of Beauty.

Then think what it must have meant to those who followed Him to stand with Him at evening on the rugged mountain side, when the sky was aflame with sunset, to watch it pale to rose and amber, and die out in purple and gray. Think what it must have meant to be with Him at daybreak, when the mists rolled back over the blue water, and the waves leaped and sparkled with gold. Then to have shared the morning meal with Him, the water from the mountain spring, and the bread that He blessed and broke.

We can imagine that the journeys on foot of the Lord and His disciples were not taken in haste, but that they stopped to rest by field or grove, and that the Master would wait to speak to a child, or to pick up a wounded bird, or even to gather the lilies, always pointing out the lessons of Nature in parables.

I believe, too, that He does not want us to run upon His errands, out of breath, without stopping to see the beauty He has spread out all about us. To all of the largeness and beauty and bounty of this life we are bidden, and to His companionship we also are called.

Following Him, the disciples saw the Master heal and bless and save. They saw Him pour His life in tireless ministry. They saw Him tried by every occasion, yet always patient and forgiving. Yet, after three years of His companionship, they failed to understand His spirit or His mission, for He said to one of them, "Have I been so long time with you, and yet hast thou not known Me?"

What was the object of keeping them near Him so long? It was to train them for service, to carry on His work in the world.

We, too, are called to service. As it was necessary for the disciples to be much with Him to learn His methods and His spirit, so it is necessary for us.

It was a long time before the disciples were

able to do much in the way of service. At first the Master let them do the easy things, run on His errands, and help to feed the multitudes. But they made so many mistakes when they tried to do the harder things. They were not able to cast out the evil spirit when a father brought his son to be healed. And they blundered when they forbade a certain man, just because he was not one of them, to perform cures in the name of Christ. And they wanted to drive away the little children whose soft, clinging arms must have helped his heartaches. They rebuked the women who poured out the pure incense of their devotion. They quarreled among themselves as to who should be the greatest. They were so slow of heart to understand.

So, patiently, he taught them the beauty and dignity of service. He taught them that he is the greatest who is the servant of all. And He taught them two great fundamental truths of service, upon which any one can build the temple of a beautiful and happy life. And these two truths are folded in at the heart of all I have to say to you, so that if you keep these two only I shall be satisfied.

The first is that service is one condition of spiritual growth. "My meat is to do the will of Him that sent me." By the very doing of God's will we are nourished.

And the second is that service is one condition of spiritual knowledge. "If ye do His will ye shall know of His doctrine."

Both knowledge and growth come *by doing His will*.

Then what is His will?

He came that we might have life, and that we might have it more abundantly. We cannot doubt, then, that His will is health and happiness for us all. And His will is to save and to heal and to bless. He was sent "to heal the broken-hearted, to preach deliverance to the captives and recovery of sight to the blind, to set at liberty them that are bruised." When He calls us, saying, "Follow Me," He sends us out with that same commission. He said plainly, "Feed my sheep." And in solemn words, that no one can mistake or misinterpret, He commands us to clothe the naked, to minister to the sick, and to visit those in prison.

Why did Christ lay so much stress on the ministry to the poor, when trouble and sorrow and sickness come to all alike? No one will ask that question who is much among the very poor. Poverty makes every trouble worse, just as intense cold makes every ache worse. The prisoners of poverty are shackled with fetters of iron. They cannot fly to change of scene, or seek relief in recreation. They must "grind in the prison house." It is so hard to be sick and poor; to lie and toss on a hard bed, with the torment

of heat and foul odors and flies. And it is harder still to see those you love suffer for what you cannot give them.

Let me show you how it fares with those children of the shadow, those helpless, pitiful, ignorant ones who burden our hearts and tax our purses; those who drink the bitter dregs and take the scanty leavings, those whom the Master left in our care. Come with me, and we will enter some of the doors that He has left ajar for us.

In a little, close, stuffy back room of an old tenement a woman lies dying. There is no window in the room. All the light that comes to her dimming eyes, all the air she draws in her last difficult gasp, comes from another room. The place is in the heart of town, and the noise and dust of the street are both in the room.

Upstairs, another woman is lying very ill of a fever. We feel our way along the sticky walls, up the dark stairs, to the third story. The woman is alone, with no one to wait on her till her husband comes home at night. The floor is bare and worn, there is a wretched bed, a table, and a chair. On the table is a cracked pitcher of tepid water from the polluted cistern. There are no screens, no blinds. It is so hard to be sick and poor.

We find a mother and seven children living in a tiny garret. One boy is very ill with pneumonia. No wonder, for the rain has poured in through the leaky roof, and the draughts blow through great cracks in the wall. Downstairs is a set of vicious men, so brutal that the mother is afraid to let the little girl go down for water when the sick boy wants a drink.

Upstairs again, this time over a fish store. We have to take a lamp because the rooms are perfectly dark. The heavy, greasy odor of the fish floats upstairs, and there is no window to let it out. It smells strong and stale in the two rooms where two sisters are lying, both sick. We peer about the dark rooms and shudder to think of the dust and germs. The charity doctor and the district nurse come in. They look at each other gravely. It is no wonder if girls go wrong, when they have to live in such sties—nothing bright, nothing homelike, no one to care when they come in.

I wonder how many of you would care, or dare, to follow me from this place to the alley just back of it. No one but the police dare go all the way through, because the human off-scourings of the city are found there—Negro dives, full of white men and women, where drunkenness, gambling, everything awful, is to be found. A raid of the police after a fight showed lodging rooms filled with bunks and cots, in unlighted, unventilated rooms, filthy, worse than stables.

And there little children carry beer buckets and learn crime and indecency. In one room were eight people, of different families, an old man, who died that night of tuberculosis, a tiny baby, other men and women. There was no bed, just piles of sacking; the air was stifling, the filth beyond words.

We find many old tenements in which a family of from four to seven persons has only one room. Yet sometimes they have visitors, and sometimes even boarders. The house was not built for so many families. It has, perhaps, only one stairway, and convenience for only one family. Yet all these are shared by men, women, and children alike.

The young girls have to pass drunken men on those dark stairways, and encounter them in the yard. Do you wonder that these are the very breeding-places of immorality, when people are herded together like cattle, with no chance to preserve the laws of modesty and decency? And do you wonder if they are also the breeding-places of disease? Tuberculosis thrives. Infant mortality reaps its harvest. Drunkenness fastens itself here.

Where are these places? Some in my town, some in your city, and in all our cities. There are hundreds of just such houses. And in your city and in mine there are dingy rows and blocks of wretched dwellings, not fit to be called homes. There are families living in stables, over warehouses, in alley hovels, amid filth unspeakable.

It used to be thought that only great cities had slums. But these places are the worst kind of slums. Small towns, even villages, have slum centers. In fact, I have seen a number of slum villages.

Just because people have not seen these places, it is hard for them to believe that they exist. But poverty hides away out of sight, in places where you least suspect it. I have found slums on the same square with a Y. M. C. A. building. I have known of miserable tenements across the street from a church, where they had stood for years. But the people going to church "passed by on the other side" and seemingly did not know that so near to them were those who had fallen among thieves, and had been bruised and beaten, and were in need of their oil and wine.

I believe that the care of the poor and the wiping out of the slums is the rightful work of the church, more than of charity or philanthropy. Not that the churches do not do charity work. I have found the most valuable members of charity circles to be church members. And in most of our churches there is a department of "mercy and help" to care for the poor. But is not most of the alms taken by a committee, perhaps of only two or three? And, though others work

and give and plan for the poor, are not these few sometimes the only ones out of the church who ever actually see inside the homes of the poor? If our people knew the blessing that comes from the actual visit more would want to go. I believe the day will come when every member will have some special duties of social service; and then what interest and enthusiasm there will be in church work, and how the churches will grow!

Not that we cannot serve the Master by giving bazaars and teas, and with all kinds of committee work. We can serve Him, indeed, in the sweat of our brow, if not in the joy of our spirit. But so much of this work is routine and drudgery, a wholesale kind of service, not so personal and intimate as the service to the Master we give to His poor. And there is no drudgery in that; it is such a joy to think we have done something really unto Him.

When we visit the poor and the needy all the best of us goes out to them, and all the best of them responds to us. I have found as delicate appreciation among the poor as among the most cultured—not for alms, not for money, but for sympathy, for friendship, for a handful of flowers, for what we call "friendly visiting." Some of you may belong to the Friendly Visitors' Circle, and you know that you visit the poor just as you do your own friends. It is the flower of all charity work, and gives such beautiful opportunities for service, helping so truly, walking shoulder to shoulder with the dependent or morally disabled, until they are strong enough to walk alone; helping the discouraged mother to plan, teaching the young daughter to cook or sew, finding work for the boys, reading to the old grandmother, encouraging, guiding, inspiring. The wonderful thing is that you get to look forward to the visits as much as the family does, and this, I believe, is the reason:

I believe that when we go in His name to the wretched and the needy, we meet Him there. We have communion with Him, we are upon holy ground, and we know that our sacrifice is accepted because of the flame upon the altar, which is the glow in our own hearts. And in those moments we know the blessed truth of the words of Christ, and we feel that we are fed and nourished by doing His will. I have stood in the bare, miserable room where Poverty's child has lived and toiled and suffered. I have leaned over the cheap casket that, for Poverty's child, is the last hard bed, and laid upon it the few flowers that were the only thing of beauty or brightness to lighten the gloom. And there has come a revelation of the meaning of life, and of the life beyond, of the tragedy of poverty, of the kinship of all flesh, and the fatherhood of God, that has never come elsewhere. And in

that place I have felt a Presence, close and real.

O you who have troubles and sorrows, do not try to wear them out in your homes. Go to those who have had less and have suffered more, and against their dark background see how your own blessings will shine out. See how it will ease your heartache to give them of your sympathy.

And you who struggle for the light, unhappy, unsatisfied with your spiritual life, "groping," as Maeterlinck says, "about the walls of life," here is the open door, and the light streams through. "Canst thou by searching find out God?" the ancient writer asks. Christ told us, too, "The kingdom of Heaven cometh not with observation."

Stop arguing and searching, *go to work*, begin

and the wronged, and take up their fight against greed and selfishness and ignorance and indifference that crush them down. We must wipe out the slums. We must look into the cause of poverty rather than doctor its symptoms. We must do our part in the great movements that are working to uplift humanity. It is a clarion call to battle, this "Follow Me."

Each one hears the Divine call in his own way. Many hear that call "to bind up the broken-hearted, and to comfort those who mourn." Others hear the call to "prepare the way of the Lord, and make His paths straight." Every poet and singer and reformer and leader of men has heard some such call. Others hear simply the call of duty, and others still hear a faint call that sounds like conscience, and they

WHERE MOSQUITOES START IN LIFE.

One of the breeding spots of the malaria mosquito, whose fight with Uncle Sam is described by Mr. Bowles (see next page). Such land marks so distinguished the region that they have been immortalized on picture postal cards.

to do His will, and the truth will begin to dawn upon you; you will be fed, and grow, and you will have the joy and the peace that comes to those who are in the current of all good purposes.

You need not hesitate as to where to begin. Go to the homes of your city's poor. The charities secretary can guide you. Your minister knows the way.

Besides this beautiful personal service there are large tasks waiting to be done in His Name. If we truly mean "Thy kingdom come," if we are to follow Christ all the way, we must sweep aside these obstacles in the way of the church and of the progress of the race. We must cleanse our cities of breeding-places of crime and disease, we must rouse to the cries of the helpless

answer the call simply for the saving of their own souls.

But however it comes, the wonderful thing is this: Afterwhile, if we truly follow Christ, we learn of Him, we have His companionship, we grow to be like Him, and to love those He loves. We come to feel their wretchedness, their hunger, to feel that there is a spirit within us that must go homeless till the poor are housed, and this is the spirit of Christ.

'Till at last to the height of the Ultimate Truth we attain,

Not of serving to please Him, but sharing His ministry, thus,

That whatever they suffer, we feel. We can say, as He said,

"Inasmuch as men do it to these, they have done it to us."

# SANITATION ON THE ISTHMUS

JAMES TENBROECK BOWLES

PHYSIOLOGIST, ISTHMIAN CANAL COMMISSION

THE Isthmus of Panama at the point where the canal is being constructed extends from east to west, while the canal course runs nearly north and south. Stretching across the isthmus, from the Atlantic to the Pacific ocean, is the strip of land ten miles wide, five miles on each side of the center line of the canal, known as the Canal Zone. In following the line of the canal no mountain chains are encountered, and the region exhibits a chaotic aggregation of short crests and isolated hills, called "cerros."

pools of fresh water are found on every hand.

As is true in most tropical countries, there are just two seasons, the rainy, extending from May to January, and the dry from January to May. However, the seasons vary somewhat from year to year, as we have experienced during the past two years.

The temperature is tropical, and mosquitoes breed prolifically the year round. The average temperature for 1909 was below normal, being 79 degrees Fahrenheit at Ancon, while the lowest temperature recorded on the isthmus since the

MAKING THE ISTHMUS HABITABLE

Mosquitoes, open sewers, stagnant water and centuries of unacclimatized white visitors piled up quite a day's work for modern sanitary engineers. The picture shows a fumigation gang.

For the first fifteen miles the country is low and swampy, then the valley of the Chagres opens out into a broad plain. From there the route ascends the Central Divide. On the other side of the divide, the route follows the valley of the Rio Grande to the wharves of La Boca. The total distance from ocean to ocean is forty-six miles and much of the canal course finds its way through dense tropical vegetation.

Historians have always referred to the jungle as "exhaling its poisonous vapors." Water is abundant everywhere, little streams coming out from every small ravine and forming ideal places for anopheles. In the swampy sections stagnant

American occupation was 59 degrees Fahrenheit at Bas Obispo in February, 1907, and the highest temperature (in the sun) was at Culebra in February, 1907, being 105 degrees Fahrenheit.

The Atlantic side of the isthmus has always been noted for having more rainfall than the Pacific. The following table shows the average yearly fall since 1904:

Porto Bello	Cristobal	Empire	Ancon
173.02 in.	129.59 in.	90.00 in.	71.23 in.

Hail has been known to fall several times, the last being in May, 1912, on Naos Island.

The present canal route has been the princi-

pal one for crossing the isthmus since the discovery of America. The Spaniards built a causeway from old Panama to Porto Bello and paved it with cobble-stones, parts of which can still be seen. The infection of yellow fever and malaria, originated along these routes, spread greatly, and the stopping places became the centers of infection for the diseases.

Porto Bello, on the Atlantic side, was the port for all the vessels coming from Europe. Because of its excellent harbor it remained the port on the north side for many years. Even now vessels are often forced to go down there for protection from the rough seas.

From the earliest times this was looked upon as a most unhealthy place. Superstitious ideas were entertained in regard to it. From its low-lying parts spirits, miasma and the like were supposed to arise at nightfall and fill the surrounding air with deadly poisons.

Since Porto Bello was the first stopping place for all vessels crossing the ocean from Europe, it thus became the first center of infection for yellow fever and malaria. At first the route across the isthmus was over the old paved road to old Panama, but after Morgan captured the

city of old Panama, the route was changed to the Chagres river. Ships were unloaded at Porto Bello into small sailing vessels, which went on to the village of Chagres at the mouth of the Chagres river. Here another center of infection was formed. From this place the cargo was transshipped to small dugouts and carried up the river forty miles to a point where the stream changes its course. Here, at Las Cruces, another center of infection was formed. From this place the cargo was carried on pack animals, over paved roads, to the city of Panama, which became still another center of infection.

In order to understand why this infection of yellow fever and malaria has never died out, one must bear in mind that for four hundred years along this route a constant stream of unacclimated people of the white race has been crossing the isthmus. This continuous procession infected the territory with yellow fever and malaria, and kept up the infection to a much higher degree than in the neighboring tropical countries, because these countries did not have this stream of whites constantly in their territory. Nearly everybody who traveled from the west coast of North and South America crossed at Panama, so that many people of all classes sickened and died in that place. It will be remembered that a large portion of the population which went from the eastern states and from all parts of the civilized world to California in 1849 and the immediately succeeding years crossed by this route. The next great number that came to the isthmus was during the construction of the Panama Railroad, and following this were the forces introduced during the French occupation.

Thus the isthmus had acquired a reputation for bad health second to that of no other locality in the world. But this region is not naturally unhealthy. On the whole, it is attractive country, with pleasant climatic conditions and delightful trade-winds which blow across the isthmus day and night. The whole story is summed up in the fact that temperature, rainfall and local water supply happen to be favorable to the development of the stegomyia and anopheles mosquitoes. Add to this the centuries of sojourning whites and you have forces which would have produced similar conditions in any part of the world where the altitude is less than 2,000 feet, the minimum temperature not less than 60 degrees Fahrenheit and the rainfall more than thirty inches.

The construction of the Panama Railroad was started in 1850 and completed in 1855. This railroad practically follows the former route across the isthmus.

The large force engaged in building this road suffered so severely from tropical diseases that work had to be stopped several times. The un-

OLD PORTO BELLO

favorable health conditions were looked upon by the authorities as the principal obstacles to be overcome. Laborers from various countries were imported to see which could best stand the climate. At one time many Irish, Italians and Chinese were brought over. In less than a month the ranks were thinned out to a mere handful. Everything possible was done for the Chinese, as great results were expected from them, but they, too, died off rapidly. History says that every railroad tie means a dead Chinaman; but this is not true because there were 100,000 ties between Panama and Colon, and the forces never numbered more than 6,000 or 8,000 men. After experimenting with labor from various

no sewer system, neither was there any provision for garbage disposal. Refuse was thrown into the streets to decay and attract all kinds of vermin. A small hospital was built for Panama Railroad employees, and was in charge of the Sisters of Charity.

A great deal has been said about the mistakes that were made by the French, about their manner of living, etc., but our experience on the isthmus readily showed that the greatest blow to the French company was the lack of sanitation. If modern knowledge of sanitation and disease had been possessed at that time it is possible that France herself might have built the canal. She did accomplish a great deal. Some

OLD PORTO BELLO

It was this sort of thing which made this ancient town the first center of infection for yellow fever and malaria.

countries, it was finally proved that West Indians most effectively withstood the climate.

The diseases during this time were fevers of various types. "Chagres fever" was rank everywhere and yellow fever had been sporadic on the isthmus for a long time. Smallpox had been abroad occasionally, and many foreigners wrought their own destruction through drink.

The water supply consisted of rain water caught in tanks or barrels during the rainy season and held for use during the dry. These tanks were not covered and hence made an excellent breeding place for the yellow fever mosquito. Later a small reservoir was built to supply water for the railroad only. There was

of the final plans have been followed, and much of the machinery, data and some of the buildings are still in use, while the charts and river gauges have been extremely valuable.

M. de Lesseps asked Dr. Louis Campanyo, who was the medical advisor for the French Canal Company, to submit a "Service of Health" for use during the construction of the Panama Canal. This "Service of Health" is very interesting to us now. It was curative rather than preventive.

His idea was to gather the laborers in centers in the more healthful localities removed from their work. Later these groups became centers for yellow fever and malaria. Swamps were

BEFORE—

The first of these pictures shows a street in Panama City as it was when Americans came. The second shows the same street as it is to-day.

AND AFTER

to be cultivated with trees and plants requiring a large quantity of water, such as the eucalyptus and all kinds of gum trees. Then the medicinal properties of these trees were to be used in treating fevers.

In the fear that snake bites might give them much trouble, relief stations for the treating of snake bites were to be established along the line of the canal. They were to build hospitals and a sanitarium where employes were to be treated by Parisian surgeons.

Now, what was really done toward sanitation was the construction of a sanitarium at Taboga Island, a large hospital at Ancon and a smaller hospital at Colon. All of these hospitals were in charge of the Sisters of Charity.

The hospitals soon became infected with yellow fever, as the legs of the beds were placed in jars of water to keep the ants away. Each of these jars became a potential breeding place for the deadly *stegomyia* mosquito. They bit the infected man on the bed and then flew off to disseminate the disease far and wide. Very soon the white French employes refused to go to the hospitals, preferring to remain in their own quarters. One can see the causes for the frightful losses of the French by yellow fever and malaria. It is estimated that 22,000 died from these diseases.

There are no means of getting at the accurate death rate for that time, as no general records were kept until the American occupation. But some basis for comparison can be obtained by taking the records of the Ancon Hospital, which were accurately kept.

Thus, besides the construction of the hospitals, nothing was done for sanitation. No sewers or water supplies were constructed. Streets and alleys were used as open sewers, and rain water, caught in barrels or tanks, served as the water supply.

The Americans took possession of what is known as the "canal strip" in the spring of 1904. According to the treaty, the Republic of Panama

gave us sanitary control over the Canal Zone, and also over the cities of Panama and Colon. This treaty gave the United States the right to construct sewer systems and water supplies through the cities of Panama and Colon and to be reimbursed for the money spent in doing it.

The experience of their predecessors, who had built the railroad and who had attempted to construct the canal, convinced the sanitary department that unless it could protect the forces against yellow fever and malaria, the men digging the canal could never accomplish the work. Such sanitary measures, then, as could control these two diseases, were the necessary preliminaries to starting the construction of the canal.

Previous to this Colonel W. C. Gorgas, the chief sanitary officer, had just completed the cleaning up of Havana and had freed it from yellow fever. He was ordered to take charge of the sanitary work on the isthmus.

One of the first things that Colonel Gorgas did was to make a sanitary survey of the field. By this means he found that conditions on the isthmus were radically different from those in Havana. The work here was much more scattered than in Cuba. It took sixteen months to rid the isthmus of yellow fever, whereas it had taken only seven months to rid Cuba of the disease. This is explained by the fact that the sanitary department had been established and running in Havana for two years when yellow fever prevention was first commenced there.

In organizing the sanitary work, Colonel Gorgas early established an efficient maritime sanitary service. This was necessary, since on the west coast of South America there were many ports infected with plague and several with yellow fever. On the Atlantic side, both above and below the isthmus, were ports infected with yellow fever.

The hospital division was organized with two main hospitals, one at Ancon and a smaller one at Colon. Twenty-five small hospitals or dispensaries were placed along the line.

#### THE FOE OF STEGOMYIA AND ANOPHELES

Col. William C. Gorgas, who freed Cuba of yellow fever in seven months, performed the same service for Panama in sixteen months. In the latter place he had to begin with a sanitary survey and practically establish his own sanitary department. As a result of the anti-malarial fight on the isthmus the sick rate decreased from 6.83 per cent in 1906 to 1.54 per cent in 1911. Colonel Gorgas is chief sanitary officer of the Isthmian Canal Commission.

JULY 1, 1910—

Both pictures show Hudson Lane, Colon. The open sewerage ditch in the first was only recently replaced by the paving in the second.

A LITTLE LATER

The health division of the isthmus was and is under the care of J. A. LePrince, sanitary engineer, who had charge of the mosquito work in Havana. Coming to the isthmus well informed as to the habits of mosquitoes, he has accomplished a remarkable piece of work there.

The first work attempted was to rid Panama and Colon of yellow fever, or in other words to do away with the *stegomyia* mosquito. To do this it was necessary to provide a water supply as soon as possible, and before a pipe-borne system could be established it was necessary to screen and put faucets in every water barrel. Along with this work, every possible breeding place for mosquitoes was destroyed.

The work went slowly at first because so many things had to be done at once, and the people back in the states were saying that they wanted "to see the dirt fly." The commission, anxious to make a showing with the people, tried very hard to make the "dirt fly" at the same time, considering the sanitary work as a secondary matter. Thus, by the early part of 1905, a considerable number of non-immunes had come to the isthmus and yellow fever had begun to affect the force generally. Already many of the people looked upon the mosquito theory as a failure. Lack of supplies had prevented the sanitary de-

partment from making a blanket fumigation until at this time. However, with a thorough fumigation and the installation of a pipe-borne water supply, the epidemic of yellow fever was wiped out by December, 1905. The total number of cases was 246. Among these were 133 employees. The total number of deaths was 84; among these were 35 employees.

Judging by the alarm caused by the comparatively mild epidemic of 1905, there is no doubt that if the American force had had the same amount of yellow fever that the French had, the work of constructing the canal would have been stopped on account of lack of men.

Having wiped out yellow fever, the attention of the sanitary department was now drawn to reducing the amount of malaria. One-third of the canal runs through a low, alluvial and marshy plain, and the other two-thirds through a hilly and mountainous country. Along the banks of the little rivulets which run everywhere the anopheles, or malarial mosquitoes, breed just as well as in a marshy level country and the general infection of the population by malaria causes most of the anopheles near human inhabitants to become infected. By actual microscopic examination of the blood of several hundreds of these people it was found that 70 per cent of them had the malarial parasite circulating in their blood.

The results of the anti-malarial work from 1906, when the fight was just beginning to be effective, to 1912 shows a reduction in sick rate of from 6.83 per cent. to 1.54 per cent. in 1911. Besides this there were 283 deaths from malaria in 1906 among employees and only 50 in 1910. This excellent showing of the sanitary department represents a great saving in labor and the cost of treatment. The efficiency of the force has been increased through not being sickly or anemic.

At the same time we have anti-plague, anti-typhoid fever and anti-dysentery work going on, with a result of no plague, a typhoid rate almost nil and a low dysentery rate.

READY TO BURN  
A garbage dump at Colon, Panama.

The cost of sanitation on the Isthmus of Panama, as shown by Colonel Gorgas in a paper read in June, 1910, before the American Society of Tropical Medicine, is two and one-half cents per capita per day for medical and hospital treatment, and for sanitation alone only nine mills per day. This amount is well within the financial ability of any tropical community.

The results of sanitation have been the conversion of a territory, known for several hundred years as the worst kind of pest hole, into a delightful health resort, and the demonstration to the world that the white man can live and work in any part of the tropics and maintain good health. All this has been done at an expense which could reasonably be met by any country.

Another interesting thing which may result from this work is the probability that the tropics will resume their place as the forcing-beds of human progress, having lost this position through the devastation of disease.

No other President has had the opportunity to observe personally the results of scientific

sanitation that President Taft, as secretary of war, had in the Philippines, in Cuba, in Porto Rico and in the Canal Zone. In an address before the Medical Club of Philadelphia, in 1911, he said:

It is not too much to say that yellow fever and malaria contributed more than any cause to the failure of the French. Is not such a record one on which we can dwell with international pride?

The sanitation of the isthmus adds another triumph for the army and navy to their activities in the orient and the tropics. If the Spanish-American War and the resultant activities of our army and navy in the orient and tropics did nothing else, the loss of life and money associated with them were more than repaid by the advantages brought to this world at large by the eliminating of some of the tropical scourges that through centuries have been a puzzle and despair of mankind.<sup>1</sup>

<sup>1</sup>The writer wishes to express his thanks to Colonel G. W. Goethals, chairman Isthmian Canal Commission, for permission to publish this article and to Colonel W. C. Gorgas, chief sanitary officer, for his kindness in assisting the writer to procure data on the sanitary work.

## THE ITALIAN WORKMEN OF AMERICA TO AMERICANS

EDITH WALLER<sup>1</sup>

*Give us a chance! We are men!  
Not "wops and dagocs" base;  
Cease with your names that would disgrace.—  
The blood in our veins of an ancient race  
Flows proud and fiery free;  
Your scorn does ye debase.*

*Give us a chance! We are men!  
Know ye the past whence we come?  
Back of us Rome, the glory of Rome!  
St. Peter's embracing dome,  
The law and art of the world,  
Have ye a name like Rome?*

*Give us a chance! We are men!  
Forth our Columbus bold,  
Braving defcats untold,  
Out of the seas of darkness old,  
Brought light to your continent new  
For ye to have and hold.*

*Give us a chance! We are men!  
To-day Marconi stands  
And weaves the nations' strands,  
Annihilates seas and lands,  
Holds elements in thrall  
To make the worlds join hands.*

*Give us a chance! We are men!  
Not earthworms born of the soil,  
We would upbuild not despoil,  
Faithful and earnest we toil;  
But music and beauty, life's pulsing joy,  
Are ours above the moil.*

*Americans! We are men!  
Strong bodies with souls of flame;  
Where ye can progress claim  
Help us to win the same,  
Give us a chance, but a chance—  
Forget not Italy's name!*

<sup>1</sup>Miss Waller is the author of English for Italians.

# SOCIAL WEEK AT ZURICH

CHARLES R. HENDERSON

THE "social week" at Zurich last month was the fruition of plans laid a year ago at Ghent to bring together representatives of the four principal international associations which have been formed to promote legislation and improved administration in the interest of wage-earners. It has become evident that time and expense can be saved by holding such conferences near together, and that duplication and conflict can thus be reduced to a vanishing point. The spirit of co-operation manifest here is admirable and a sure augury of united and successful action.

The first meeting was that of the International Committee on Unemployment which held its first congress at Paris in 1910 and will organize the second for Ghent in 1913 during the exposition. The minister of labor of France, M. Leon Bourgeois, assisted by Imperial Councillor Dr. Freund, presided in his charming manner. Seventeen countries, including all the principal nations of Europe and the United States, were represented. Lee K. Frankel was the regular delegate for the United States, J. B. Andrews and Prof. C. R. Henderson being alternates of Professors Farnam and Devine and having also been appointed spokesmen for the American Association for Labor Legislation. M. L. Varley of Ghent is secretary, M. Max Lazard of Paris is secretary-adjoint and editor of the bulletin of the association; M. E. Anseele, deputy in the Belgian Parliament, is treasurer.

Among the principal speakers were: Prof. G. von Mayr, the distinguished statistician; M. Arthur Fontaine of the French Council of State and director in the Department of Labor; Prof. Raoul Jay of the Faculty of Law at Paris; Dr. Georg Zacher, imperial councillor of Germany, and Professor Mischler, court councillor of Austria.

Carefully prepared and printed reports were in the hands of each delegate before the sessions; each speaker was obliged to discuss the propositions actually before the meeting, and set speeches were excluded, though some of those delivered were too long. The first business was the discussion of schedules and procedure for a uniform and scientific collection of facts in regard to employment agencies under the leadership of Drs. Freund and Zacher. The proposed schedules were examined line by line, amended and adopted. A report was also offered by E. Szabo, city librarian of Budapest, and M. Varlez on the compilation of a bibliography on unem-

ployment.<sup>1</sup> A report of M. Varlez showed the present state of statistics on unemployment in different countries and offered suggestions for their improvement. C. P. Neill, United States commissioner of labor, was ably represented by Mr. Verrill of the Bureau of Labor. Mr. Somogyi of Budapest urged the importance of local studies of unemployment, and the general sentiment was favorable to the organization of such investigations in which business men, trade unions, public officials and university seminars should co-operate so far as possible.

M. Treub of Holland led the discussion of the subject of public works in relation to unemployment. The national, state and municipal governments are themselves great employers of labor. Webb (*vide* Prevention of Destitution), Beveridge and others have urged that the contracts for public work and the direct employment of workmen might be so arranged as to diminish the amount of suffering from enforced idleness.

Perhaps the discussion which will most interest Americans was that on emigration and immigration, presented by Mr. Ferenczi of Budapest. The international association received an instructive report from L. Marchette which throws much light on the extent and consequences of the emigration of Italian laborers. All agreed that migration is a necessity, that each nation has the right to restrict and regulate it so far as self-protection requires, but that when immigrants are received it is the duty of the government to assure to them protection against exploitation and injustice. Here the national organization of labor exchanges is evidently of vital moment.

The representatives of the American Association for Labor Legislation, in accordance with their instructions, drew up by-laws for an American section of the International Association on Unemployment and these by-laws were accepted by the committee of the latter body. Thus the way is clear for a form of co-operation which will give to various movements to promote legislation a common center, an expert secretary, and yet preserve the advantages of specialization.

## Homeworkers' Conference

The International Association for Household Industries, the second body to hold its conference, has a somewhat different constituency and order of business. In this congress one meets

<sup>1</sup>Titles of books, documents and reports of American origin may be sent to J. B. Andrews, 1 Madison Ave., New York City to be forwarded.

many women, factory inspectors, priests interested in the material well-being of humble parishioners, representatives of trade unions and consumers' leagues, as well as public functionaries and university professors. The president is Professor Brandts of Belgium, a land of small industries. The first section plunged at once into the problems of minimum wage boards. Four languages were spoken, with résumés by an admirable interpreter. There is great advantage in stopping discussion after each speech or reading of a resolution to hear the same thoughts expressed in a second language, in that there is time for critical reflection on the matter at issue. And it is curious to see the effect on the excitable Frenchman of a more quiet address by a German; the Celtic oxygen is too combustible alone and gains by suitable mixture with Teutonic nitrogen. A Belgian committee had drawn up a model bill for a law on minimum wage boards which was considerably battered in the course of a lively debate, during which twenty people sometimes talked at the same time, especially if the orator on the platform was tiresome.

The influence of the Australian and English legislation on minimum wage boards is marked and decisive, though some German criticisms were heard. The second section recommended careful investigation of the conditions of home workers as the foundation of further action. It insisted that the household workers shall be protected by sanitary measures and public inspection, and that the advantages of existing laws and insurance be extended to this class. The interests of consumers must also be considered. No food or tobacco should be made in homes; contagious diseases should be notified; thorough disinfection should be provided for, and when materials of value must be destroyed or wages are lost in the interest of public health, indemnity should be paid.

The third section brought in resolutions relating to the action of trade unions and collective bargaining and urging the organization of such associations and co-operation with consumers' leagues. The fourth section offered recommendations on the subject of the aid of consumers in protecting home workers.

### *Social Insurance*

Unfortunately the Association on Social Insurance and the various sections of the Association for the Legal Protection of Workmen met at the same time so that no one person could follow the entire discussion. It was possible, however, to attend the final sessions where all the conclusions of special committees were discussed and voted in general assemblies.

In the conference on social insurance the following topics were discussed, elaborate printed reports being furnished each delegate, accompanied by brief summaries: (1) the extension of obligatory insurance to persons of better income and social position; (2) insurance supplementary to the compulsory insurance through voluntary organization; (3) the financial burden of social insurance; (4) international statistics

of accidents; (5) petty accidents. The masterly address of Professor Paloty emphasized two points: (a) those who do not depend on wages for a living and yet need insurance should either be required to take advantage of the obligatory arrangements or at least be permitted to do so; (b) so far as such persons are excluded from the obligatory arrangements they should have access to a voluntary form of insurance not only supervised by the state but actually assisted. Two yet unreconciled tendencies came to light, one favorable to voluntary organization, the other to compulsory laws. As agreement could not yet be reached the subject was referred to a special commission for further investigation and future reports.

Dr. Bulefeldt of Lubeck defended the following propositions:

(1) Compulsory insurance is designed to furnish the foundation of security of life for those who have little more than what is absolutely necessary for existence in such emergencies as sickness, accident, invalidism, old age and death of the bread-winners. (2) Improvement of the conditions of those of small means who receive rather better incomes must be gained by the development of voluntary insurance. (3) Although considerable freedom should be given in respect to the method and extent of insurance, yet it is desirable to supplement compulsory with voluntary insurance. (4) The obligatory machinery should be employed when possible, but every facility furnished for extending voluntary insurance. (5) In the administration of private insurance companies expenses should be as low as possible, and the principle of savings should be joined with that of insurance so as to give the insured a choice between them. (6) These arrangements should be fostered by the government, by employers and by philanthropic societies. (7) Persons who are not under legal obligation to insure should have free access to the institutions of the public and those who have the minimum of compulsory insurance should find it easy to increase their protection. (8) Private insurance institutions should be so developed as to equal the public offices and special conveniences be added, as facilities for changing the profits, sharing profits, credits for loans, prevention of lapses, preventive measures against sickness, use of capital funds for building dwellings, etc.

Perhaps for Americans, the address of Dr. Freund was of greatest interest. He referred to a pamphlet which ought to be translated and given widest publicity by our Bureau of Labor: *The Burden of Social Insurance in Germany* by Dr. F. Zann. In view of the widespread circulation of a one-sided and destructive criticism of obligatory insurance the intelligent and constructive book of W. H. Dawson, *Social Insurance in Germany*, deserves general attention.

The conference has decided to hold the next Congress on Social Insurance at Washington in 1915, the official approval of our federal legislature having come to our knowledge at Zurich through a dispatch from the Department of State to M. Poincaré, president of the International Association on Social Insurance. It is too late

to prepare for a meeting of this magnitude and importance in another year. By 1915 the new and improved German law will show its results in statistics, and we in the United States, it is to be hoped, will have struggled out of our Bedlam of inconsistent and hasty legislation, have a federal law and be able to offer more than mere promises to pay, drawn on the bank of our hopes and boasts.

### *Labor Legislation*

The number of American representatives present at the conference of the International Association for Labor Legislation was naturally large: C. H. Vevill of the Bureau of Labor, Mr. and Mrs. J. B. Andrews, V. von Borosini, Charles M. Cabot, Lee K. Frankel, Ernst Freund, Maud B. Hoyt, Carl E. Perry, Mary C. Wiggin, and C. R. Henderson. The array of titles from Germany was appalling, but the men themselves were genial persons and would be welcome as agreeable gentlemen in Boston or Chicago. "Excellence," "Privy Councillor," "Lord" and "Marquis" are just earnest and friendly persons of high ability who wish to serve their fellowmen. They are too great to have grand airs. By their side are distinguished representatives of science, known the world over in medical circles. Basel, with the able and indefatigable Professor Bauer as director, has become the world center for information in regard to the protection of workers. This office publishes the *Bulletin* already well known in its English edition in America.

The members of this conference were divided, according to their choice, into five "commissions," each of which labored over a particular problem: (1) general business of the international association; (2) occupational diseases; (3) home industries and minimum wage boards; (4) hours of labor and periods of rest; (5) insurance of workmen, child labor and administration of labor laws.

In our commission, in a wave of courtesy, it was seriously proposed by one member from central Europe that the reports should be published not only in French, German and English but also in the *American* language!

Among the items of the report from the first commission was the grateful recognition of the action of several governments which have prohibited the use of poisonous phosphorus in the manufacture of matches. "The association wishes on this occasion to thank the American section again for their zealous work in promoting this legislation." The commission also recommended co-operation with the associations on unemployment and insurance. It was decided to hold the next delegates' meeting in Basel in 1914.

The second commission gave information on

industrial diseases, called attention to the list of poisons presented by Drs. Sommerfeld, Fischer and Teleky, asked for further studies of lead poisoning, ferrosilican, caisson disease and anthrax, and of the statistics of occupational diseases and mortality.

The report of the third commission covered the same ground and reached in the main the same conclusions as the conference on domestic industries. The minimum wage boards were approved and their organization was outlined. The truck system and the imposition of fines were condemned. Methods of protecting persons engaged in the making of embroidery were approved.

The recommendations of the fourth commission were also adopted without much change: approval of the eight-hour shift in continuous industries (where work continues day and night), especially in iron and steel plants; in glassworks a working week of fifty-six hours on an average with an uninterrupted weekly rest of twenty-four hours; introduction of the three-shift principle in other similar industries as rapidly as possible. It was decided to push inquiries in regard to the needed protection of railway employees in respect to fatigue, accidents, settlement of disputes and sickness. The members of the American Association for Labor Legislation who are also subscribers to the *Bulletin* will receive the English translation of all the papers and proceedings of this inspiring and instructive conference of delegates.

The Union of International Associations, being the union of all the international societies, is one of vast extent and very general aim. Its central office is at Brussels, Belgium (3 bis, rue de la Régence). The Carnegie Endowment for International Peace has given it life and force by an annual subsidy of 75,000 francs.

At a luncheon given by the Bureau of the International Association for Labor Legislation to representatives of the two other great bodies the discussion turned on a plan of co-ordinating the work of the three organizations for protection, insurance and the combat with unemployment, and of organizing societies in countries where the great industry is just beginning, as in India, China, Japan and South America. It was a little trying to the nerves of an American to see that the United States is put in a category with rather backward countries, although it is admitted that latterly we have joined the procession of peoples who believe that governments are agencies of justice, morality and humanity. The effort of our own American Association for Labor Legislation to unify all movements in the interest of wage-earners is in line with the cordial agreement reached at this meeting of officers of all the three international societies in this field.

## THE COMMON WELFARE

### SHORTER HOURS IN NEW YORK FACTORIES

On October 1 a fifty-four hour law for women went into effect in New York industries. This is a law similar to the Massachusetts statute which became operative January last and which, like a gong, set going the labor struggle at Lawrence which ultimately put the burden of the change on the textile companies. The outcome in New York of adjusting the pay to the new weekly schedule will be watched with more than ordinary interest.

The human significance of the change is well illustrated by an incident related by an agent of the New York State Factory Investigating Commission.<sup>1</sup> Violet Pike tells of finding a young girl leaning against a wall in a factory which worked eleven hours a day for five days, keeping within the sixty-hour law by a Saturday half holiday. "It's an awful long day," she said. When she was told of the effort that was being made to shorten the legal hours for women workers, the answer came: "They just can't do it quick enough for me." This girl was one of many to whom their ten hours' work has meant twelve or thirteen hours away from home, and whose home life was summed up in Miss Pike's report in the words: "Go to bed right after supper, too tired to go out."

The fifty-four hour law is designed to benefit such workers in health; it is not designed to injure them "in estate." It will affect workers employed in sixteen of the twenty classified

factory industries given in the Census Bulletin (1910) for New York state.

In these workshops women work side by side with men, in some cases in the same processes with them, in others in processes on which the men's work is dependent. The percentage of women in all industries taken together is thirty. In seven, more than 50 per cent of the workers are women. In only five industries is the proportion of women less than a quarter, and in only three, is the percentage of women workers negligible. Thus the working day for whole ranges of manufacture is to a great extent dependent on the schedule of the women workers. A majority of the more than a million New York state factory workers, male and female, will, like the factory workers of Massachusetts, be affected by the shorter legal work-day. The question is, will they also, like the Massachusetts workers, be expected to lose six hours' pay out of their weekly envelopes? In the textile centers of New York, since the new law was passed, representatives of the Women's Trade Union League have reported uneasiness and rumors of a cut to fit the law. Especially has this been true of the Utica district where the knit goods industry, exclusive of cotton and other textiles, alone employs six thousand workers. The unrest in Utica dates from an unsuccessful strike of last March which left but a small organization of workers behind it. The grievances alleged are many, among them a tacit agreement among the piece workers that none of them should claim in any week, whatever her output, more than ten dollars pay, be-

<sup>1</sup>Violet Pike in Appendix IV (Condition of Women Factory Workers in New York State) of the Report of the State Factory Investigating Commission.

cause of the dread, based on past experiences, of a cut in the piece rates which would "sweat" all workers to keep abreast of their former earnings. In such a situation, it has been predicted that unless there is a corresponding increase of rates, to overcome the loss of 6 hours' working time, there is bound to be a flare up among the workers, just as in Massachusetts, whenever a short envelope puts in an appearance. A mill superintendent was recently quoted to the effect that he "was afraid there would be trouble when the help went on an eight hour day." In an interview with a Utica manufacturer, a representative of the Woman's Trade Union League was told that as the previous laws regulating women's work had fallen on the employer, it was the workers' turn this time. "The law," he said, "has not treated us square. This time it is up to the workers." A telegram in the *New York Times* from its Utica correspondent reported as follows:

"Wherever possible, men will be allowed to work sixty hours per week. There will be no change in wages, and those whose hours of labor are reduced, must stand the loss.

"Some of the mills have been running five days a week for some time, and conditions are such that if a strike is threatened the mills will be closed."

The experience of the world, as Josephine Goldmark's *Fatigue and Efficiency* has demonstrated, goes to show that the short-hour day is

perhaps the most important health measure to be taken in the interests of a generation of working women; state after state may be expected to enact such protective legislation; the question as it confronts women in the flesh is whether its inauguration is at the expense of a short pocketbook—or a long strike, which comes to the same thing.

#### MEN OF COMMERCE AND THE COST OF LIVING

At the concluding session of the Fifth International Congress of the Chambers of Commerce and Commercial and Industrial Associations, held in Boston week before last, Professor Irving Fisher of Yale presented the report of his committee favoring an international conference with reference to the cost of living. The congress adopted unanimously his report which emphasized the necessity for full and exact information as to rising and falling prices, crises and depressions, phenomena of business affecting the problem of the rising cost of living. The action in the United States Congress providing for such a conference, to be called by the President was endorsed.

The international congress, in its deliberations, recognized that the time has come when business men need a stable unit of purchasing power just as they have a stable unit of length, weight, energy, electricity, etc. The proposed conference of nations would consider methods of im-

### LAWRENCE DEMONSTRATION STRIKE

Lawrence has added another chapter to American industrial unrest in the twenty-four hour demonstration strike, which crippled the mills on September 30. The strike was called, not because of grievances, but to show while their trial was pending that the Lawrence workers consider the imprisonment of Ettor and Giovanitti unjust. First came a leaderless, irresponsible walk-out on September 26 which, despite the protest of the imprisoned men, grew until 12,000 had quit work; then the open air meeting, shown on the opposite page, which voted the twenty-four hour demonstration strike. Carlo Tresca, the middle figure in the adjoining group, an I. W. W. leader from the Pittsburgh district, was active in its direction.

The day following, the English speaking community at Lawrence had a chance to express themselves in the special election for school committeemen when John J. Breen, who had confessed to planting dynamite to destroy the strikers, was up for re-election. He was overwhelmingly defeated.

At Salem, meanwhile, a venire of 350 jurors has been exhausted and the trial of the two immigrant leaders postponed until October 14.

proving our knowledge as to the actual cost of living in various countries, the causes which have increased this cost, and the remedies which might be applied. It was further recognized that as the convulsions in prices and the consequent disturbance to business are worldwide, only an inquiry of international scope can reach the true causes and remedies.

One remedy suggested by Professor Fisher for the unstable purchasing power of money was similar to a suggestion once made by Governor Woodrow Wilson. It is virtually (although not literally) to increase the weight of the gold dollar by increasing the weight of the bullion on which it is based. The gold miner would be required to take more than 25.8 grains of gold to the mint in order to secure a dollar of gold which weighs 25.8 grains, the present weight. The coined dollar would remain unchanged, but the "bullion dollar," as Professor Fisher called it, would become heavier. The difference between the two would be *seigniorage*; in other words, Professor Fisher's plan is to restore the *seigniorage* on gold. But he goes farther in that this *seigniorage* is not to be fixed once for all, but is to be continually adjusted so that the "bullion dollar" shall always retain the same purchasing power.

The official index number of prices like that now constructed by the Bureau of Labor will show from time to time what the *seigniorage* is to be. If the index number shows that the price

level has risen a certain per cent, the *seigniorage* will automatically go up that amount.

In his remarks upon his report, Professor Fisher pointed out the lack of exact statistics available; that while many nations prepared index numbers of price levels, few of them were really valuable and almost none of them were comparable because of the different methods of averaging such statistics. It was, therefore, apparent that, even if the proposed conference should restrict itself to an investigation simply of the facts involved, and should consider neither the causes nor the remedies for such high prices, that work in itself would be sufficient justification for it. Exact knowledge must ever be the true basis for sound discussion and legislation. Moreover, an increase of knowledge of the facts involved would of itself contribute to a knowledge of causes, and it was not denied that a conference in which all parts of the world present information and points of view would aid in creating a truer perspective.

While the congress unanimously approved of the idea of such an international conference, it did not feel that it lay within its province to endorse the remedy suggested by Professor Fisher, or any other remedy. The discussion of that economist's report emphasized the belief that the higher and increased standard of living, the law of supply and demand, which had answered to a demand for commodities far in excess of that of any previous generation, had

also tended toward a higher cost of living, and that it was as essential to consider these facts at this proposed conference as the character of the standard of value.

The attitude of the congress toward this and other questions generally regarded as purely commercial is well characterized by the remarks of President Russell of the Boston Chamber of Commerce in introducing President Taft at the evening banquet. President Russell said:

"They (the delegates) truly represent all that is foremost and best in commercial activities, and commercial activities are no longer confined to the narrow realm that marked the past. Today, the grave questions that occupy your attention, the broadest and most far-reaching, are such great questions as that of conservation, and I do not mean the mere conservation of mines, of forests, and of forest streams, but all that pertains to the conservation of human life, of human health, and of human energy is regarded as of supreme importance in all commercial conferences."

#### INTERNATIONAL PEACE CHEERED

While the sessions of the congress considered many questions of technical interest to such trade bodies, yet there ran through the entire discussion a strong sentiment in favor of international peace, of international courts of arbitration for the settlement not only of controversies between governments, but between individuals and governments. This sentiment increased in strength throughout the week, and reached a climax in two events of more than ordinary significance. The first was when Monsieur Louis Canon Legrand of Brussels—who was the first president of the International Congress and is now president again—took the floor at the last session and presented this resolution:

"The congress affirms its desire to see established as soon as possible an international official conference which will ensure between nations the existence of arbitral courts, established in the broadest sense, and of a nature to ensure an equitable solution of all international disputes, whether between citizens of different states or between states. And the congress declares adherence to the principle of a combination of nations when and where it may be thought advisable to act whenever possible to avert the atrocities of war."

The distinguished president himself moved the adoption of the resolution, and he was seconded by representatives from many nations. The resolution was adopted unanimously amid great enthusiasm.

Another illustration of the dominant sentiment of the congress was the reception afforded the address of President Taft at the banquet which concluded the sessions of the congress. World peace, in one form or another, was the thought

in every speech at this banquet—peace that business might prosper, peace that the waste of armies and fleets might be saved, peace through arbitration, peace for the sake of the strugglers for existence. Every American voiced the hope, every European held forth the belief, that peace is coming, and coming through the broad-minded selfishness of commerce. It was as if the sentiment had grown steadily all through the sessions of the week, and now, when business had been laid aside, demanded to be heard. And when the President of the United States said:

"I believe we must have some solution of the problem that arises and some escape in the future from the burden that is imposed by this increasing armament of nations. And you will never have the solution until you have furnished some means of certainly and honorably settling every international controversy, whether of honor or vital interest, by a court upon which all nations may rely. And if, as I believe, meetings like this stimulate the desire and the determination to reach some such result, I hope they may continue year after year until the dawn of permanent peace shall be with us,"

the distinguished guests, representing almost every civilized nation in the world, broke into a tumult of applause, leaping to their feet, waving handkerchiefs, and crying, "Good, good—hear, hear—bravo, bravo!"

#### A DRINK OF COLD WATER

The fountains of Park are its pride; the fountains of New York, for man and beast, are a reproach to its citizens, judging from a recent investigation by the Bureau of Municipal Research.<sup>1</sup>

Inspection of two-thirds of the 200 free fountains for human beings in Manhattan showed half to be unfit for use. Of these, twenty-nine were entirely dry during the hot summer months. As for the other half, the sanitary ordinance of January 30, 1912 abolished the common drinking-cup, but contained no provision for a substitute, with the result that citizens can now, in many cases, get a drink only by turning themselves "wrong side up" and drinking from the faucet. It is true that Park Commissioner Stover has given orders that "where it is impossible to get the head under," the faucet itself shall be turned "wrong side up." But even so, only thirty-five bubblers were found, all told, and of these fifteen were unfit for use; in the vast majority of the fountains the faucet itself, so placed that it

<sup>1</sup>See p. 55.

does not get the wash of the water, has become a very inconvenient and dangerous common drinking-cup.

One of the charity fountains supplies paper cups at a cent apiece, but this is no more a free drink than the Cent-a-Drink supplies, with no pretensions at charity. The Cent-a-Drink, incidentally, appears to be thriving, and no wonder, for in such centers as City Hall and Battery Parks it competes with a free fountain having "three faucets, one dry, the other merely dripping" in the latter park, and in the former, it has no competitor at all.

In addition to their inadequacy in supplying what the public needs, the bureau notes the bad sanitary condition and evident neglect of practically all the fountains.

"Fountains are neglected," says the report, "in spite of the fact that inspectors are around them all the time, who should see that they are clean, and that the water does not run over and make mud puddles at the base. Many of the beautiful memorial fountains are marred by the same disgusting features found around the simple fountains."

One reason for overflow is the perpetual flow; and in this connection the bureau hazards the suggestion that the hundred new fountains that could be supplied by the wasted water might be of more importance to the public than the slight added coolness that a constant flow supplies.

Finally, the placing of fountains comes in for criticism.

"Most of the fountains operated by the city," says the report, "are found in parks or public highways. Unquestionably a relatively small percentage of the people who are working hard and who are working on the streets, go through a public park often enough to have their thirst satisfied by no matter how many fountains in the parks. Within the parks themselves the number of drinking fountains is not in proportion to the demand for them, nor is their location in accordance with relative demand. Along the Harlem river speedway, for instance, there are seven fountains having two or three jets each pouring forth streams of water—for whom? For nobody, most of the time. In contrast is the deck for pedestrians on the Williamsburg bridge, which is usually very crowded, especially in the evening. Only two fountains are found there, both of which, unfortunately, are dry. Again, in the little park situated near Thirty-fifth Street on Second Avenue, are found eight fountains for the comparatively few people who visit it, while Washington Square has only two fountains for its continuous large crowd."

The report closes with an appeal for more fountains, addressed especially to churches and Y. M. C. A's., which it says have advantageous positions in the most crowded sections of the city.

## EDITORIAL GRIST

### MUST THE COMMON DRINKING TROUGH GO?

LILLIAN J. LASER

The old wooden horse trough, the round iron horse trough,  
The filth covered horse trough is doomed, we foretell!

It sounds like "the prophylactic baby and the hygienic pup," but it isn't. It is actual fact. The need for sanitary methods has been brought home to us often enough recently to make us keep our eyes open. But most of us look so hard that we pass over the obvious things.

Did you ever stop to think that the beautiful new iron basin, which has just been erected in your town, at the corner of Main Street and Central, is a transmitting station for all the ailments of the town's horses? The stableman from whom you rent horses for Sunday drives knows it, and if you asked him about it, he would say:

"It would be better if you didn't stop at any troughs along the road. Wait till you get to a river, or borrow a bucket from some farmer to give the horse a drink. You see, you can't tell what kind of animals may have been drinking at those places, and if any of 'em were sick, the next horse'll get the same trouble."

Perhaps you will remember this warning, but the chances are that when you get to a charming old-fashioned town with a pump and a cool green trough from which the water splashes into little pools of mud all around, you will think it a fine place for your tired animal to have a long refreshing drink. And your imagination will make pretty stories about the social intercourse of dumb brutes as you watch the horse across the trough rub noses with your beast and hear the responsive whinny of delight. You will still think the picture a pleasing one when you see a small boy slip between the horses and dangle his feet luxuriously in the cool water. Why should all these pleasures be foregone? Are there really people in the world who are unsympathetic enough to demand the extermination of the time-honored trough and fountain, the monument of mankind's care for its dumb brothers?

The Horse Aid Society of New York City recently refused to accept as a gift five magnificent public watering fountains for horses which were to be erected at a cost of \$350 each. And about 40,000 of the 90,000 horses in Manhattan owned by large stables are never permitted to drink at a public basin. Why?

An investigation of 240 watering places for horses in Manhattan was made in July by the

Bureau of Municipal Research of New York. The bureau found more than a third of these places too dirty for use, and shows by a series of 150 photographs the different kinds of clean and unclean troughs.

There is the large oblong stone basin through which the water flows constantly and which the Society for the Prevention of Cruelty to Animals considers the ideal type. Then there are round iron or bronze bowls as high as a horse's chest convenient to reach and filled from an ever-flowing bronze fountain in the center—there are not many of this kind, but a few of them are quite ornamental. The characteristic type is the oblong iron trough, sometimes open at the top and sometimes high enough to be easily reached, but too often so low that the pavement all about is cracked and broken from the pawing of thirsty horses as they struggle to reach the water. Still another kind is the same iron variety with a covered top. In this top are two holes, just large enough to admit the horse's nose. The probable reason for the invention of such a device was to keep the water guarded as well as possible. The result achieved is to hold all filth securely within the basin and to make a thorough cleaning impossible.

Some horse troughs are good and some are bad, some are clean and some are dirty, but of them all, Dr. S. K. Johnson of the New York Veterinary Hospital says: "I regard the public

horse trough as one of the most pernicious sources of disease among horses." The malady to which Dr. Johnson refers particularly is glanders, a contagious disease with which a very large percentage of horses are afflicted—75 per cent is the estimate for New York. Glanders can easily be carried by the water of a common drinking place. The disease is communicable to human beings, too, although not so readily as to horses, but it is even more dangerous to man, once it gets a foothold, than to beast. Human cases have rarely been cured.

Curious as it seems, horses are able to protect themselves better than people. If the water gets too bad from filth and stagnancy, the animal refuses to drink, but the children of the neighborhood are not guarded by the same wise instinct. They play delightedly in any kind of water. They sail boats in the troughs, and pour the water over their faces and necks, they splash it excitedly over their companions and paddle in the cool slime that oozes through the broken concrete below.

Since the investigation, New York has been trying to improve the condition of troughs by more regular inspection. The few stone basins, conveniently high, and the well repaired iron basins with a constant inflow and outlet of water, minimize the dangers offered by the common drinking places, if they are watched and are kept in a thoroughly sanitary condition. But this

"A PERNICIOUS SOURCE OF DISEASE"

This oblong iron trough, with the pavement cracked and broken from the pawing of thirsty horses, is a characteristic type of public drinking place for animals in the city. It is estimated that 75 per cent of horses in New York suffer from glanders, a contagious malady often transmitted at the drinking trough.

FOR HORSES ONLY

Several relief stations of this kind are maintained at private expense in New York. An attendant washes each iron bucket after his guest has had a drink. The hose seen on the ground is used to cool animals that have become overwarm.

cleaning must be somebody's especial business, who will watch and be responsible for the condition of every trough in the city. And even where cleaning is regular, troughs cannot be guarded constantly. There is no one to stop a driver who washes his horse's mouth and bathes its wounds at a public drinking place. Nor can refuse be kept out of the basins or nuisances prohibited, despite the signs: "No dogs allowed to bathe here."

One town, Jersey City, has been far-sighted enough to do away with the common drinking trough. The health officer of New York suggests the establishment of hydrants with faucets in place of the old troughs. At such places there should be a number of iron buckets and an attendant in charge who will carefully wash each bucket after his guest has had a drink. A plain faucet with a short hose attachment for filling buckets can be placed anywhere at a practically nominal expense. Pipes outside of buildings could be tapped, or a new joint of pipe or hose could be connected with faucets or plugs already placed.

There are several relief stations of this kind in New York, kept up by the S. P. C. A., the street railways for their own horses, and by others. The proprietor of a moving picture theater, Mr. Ganes, who originated and maintains the best station at Broadway and Thirty-first street, says that the horses remember the place and often come back alone if drivers leave them unattended blocks away. This station has three shower baths—snobbishly marked "For horses only,"—an iron tub and an attendant in charge. Such an arrangement can be installed for fifty dollars, and an attendant kept in charge at a cost of \$1.50 a day.<sup>1</sup>

Mr. Ganes became interested in the relief

work for horses last summer when he saw a horse drop in front of his place from heat exhaustion. While waiting for an officer to come to shoot the animal Mr. Ganes had one of his men turn a stream of water on its head. By the time the officer arrived the horse was able to stand up and be driven away.

A great many horses would be saved from heat exhaustion in just this way if the stations were numerous enough, and certainly many more would be saved from contamination. But the new stations must be placed with regard to the needs of the horses and not to the business of the nearest saloon-keeper. Exactly one-half of the watering places for horses in New York city are in front of saloons, the owners of which claim that they owe about 40 per cent of their business to the troughs.

Fore-sighted manufacturers have recently produced bubbling fountains for horses similar to those already installed for human beings. These new fountains are being widely advertised. Perhaps they anticipate a law that will post notices: "After January 1, 19—, no public drinking cups for horses will be provided at public watering places."

## FEDERATION OF CATHOLIC CHARITIES

Rt. Rev. D. J. McMAHON

The National Conference of Catholic Charities had some reason to thank the wet weather for the almost uninterrupted series of meetings which were held in Washington, D. C., the last week in September. The rain gave it something of the character of an old-time retreat. The meetings of the conference were held in the halls of the Catholic University about thirty minutes from the national treasury and the delegates who arrived for the first gatherings at 9:30 in the morning, remained until the closing of the improvised afternoon sessions, since none could comfortably venture out in the rain.

About forty papers and addresses were given on the general topics of needy families, children, immigrants, chronic sick and co-operation. There was a decided improvement in the quality and merit of the treatment of the subjects, and while all must hark back occasionally to first principles, the forward step was constantly shown and the religious view was ever prominent in each speaker's text.

The conference opened with mass on Sunday, at which there was an attendance of nearly 600 delegates, who stayed during the conference. The Right Reverend Bishop Canevin of Pittsburgh preached the opening sermon and inspired his hearers by his enthusiasm for the cause of charity and his solemn appeals for the extension of the work and for the increase of workers.

<sup>1</sup>Popular Mechanics reports that the Woman's Society for the Prevention of Cruelty to Animals has installed several shower baths of this ideal type.

The address of the president, Right Reverend Thomas J. Shahan, rector of the university, was a masterly effort on the intimate connection between the Catholic Church and charity in the early centuries of persecution, in the Middle Ages of the monasteries and the guilds and even in its silent influence through these three centuries when, as De Maistre said: "History has been a calumny against the church." She has had her heroes raising up bands of priests, brothers and sisters whose lives were sacrificed for the good of others—Thomas of Villanova, Camillus of Lellis, St. Vincent de Paul and others. The breaking down of the economic system of *laissez faire* has brought about one reaction toward socialism and another toward the upbuilding and reinforcement of Christian charity by those not wearing the religious garb.

The paper of Thomas M. Mulry on The Church and Government was an interesting recital of the history of the connection between the private institutions and the government, as represented in New York state. Mr. Mulry drew on their need in the past, their struggle for life in the Constitutional Convention in 1894, and on later events. It was an interesting, honest and fair exposition, as became a member of the State Board of Charities.

Co-operation was urged under its various forms. To give it cogency and effect a preliminary meeting was held on Saturday and each afternoon thereafter, which resulted in the formation of a Federation of Catholic Women's Charitable Societies, with representatives present from most large centers between Bangor and Seattle. It may bring about in time a union of such organizations similar to that of the St. Vincent de Paul Societies.

A new topic was introduced that partakes of the nature of real charity; namely, the case of the chronic sick, their visitation, their treatment, their relief. It was pointed out that they are usually sent to a hospital leaving behind all hope of seeing friend or kin thereafter.

There was a clear exposition of the work and importance of the Federal Children's Bureau and a luminous paper on the real relation the state bears toward the child and its parents when it becomes dependent, defective or delinquent. Danger there is in yielding to state authority in this line for the state is made up of families and secondarily only of individuals. These papers were well presented by two able lawyers, Mr. Riley of Lancaster and Judge Girtin of Chicago.

The education of children in institutions was discussed by Brother Henry of the New York Catholic Protectory, while the section on delinquents urged most vehemently the home care as well as probation of the children who showed tendencies towards leaving the narrow path of

respect for authority. Time, with constant iteration of the thought, will bring about a more charitable view of the delinquent adult or juvenile on his exit from an institution. The idea now requires patience for its advocates, but will it not likewise demand extraordinary forbearance when it does come to realization? This was shown by the papers of Dr. Charles McKenna of New York, J. J. McLoughlin of New Orleans and Rev. J. Donohue of St. Paul.

The immigrant in his ignorance with his surrounding cormorants was strikingly portrayed, while the energy, ability and quickness of his children, as shown by Mrs. Mandel of New York, required far more guidance than home care gives.

The present methods of treatment and the medical view of the defective child were dealt with by Rev. M. McCarty, S. J., of New York and Dr. Mary Porter of Chicago. The sex hygiene questions were easily solved by the good mother aided with the church's general action in the confessional. Judge De Lacy of Washington, E. Mulready of Boston, Brother Barnabas and William Doherty of New York entered the discussions in these sections.

Some discussion was aroused by the proposition to have the conference annually, but the almost unanimous vote made it biennial, with Washington as the fixed seat. The officers were re-elected—Monsignor Shahan, president, Rev. W. J. Kerby, secretary and William H. DeLacy, treasurer.

---

## THE TREND OF THINGS

---

Perhaps the most authoritative article of the month is Dr. Wiley's review and analysis, in *Good Housekeeping*, of the present status of pure food legislation—"progress and regress"—both national and state. In the following table *Good Housekeeping* presents the strength and weakness of the federal law:

### WHEREIN THE PURE FOOD LAW FAILS

Unfortunate compromises with the "interests" were deemed necessary by its framers

"Distinctive" names of food products, permitted by the law, afford excuses for frauds

False claims to curative properties of drugs are permitted by court decision

Bad provisions of the law tend to become vested interests

The law's tendency is to favor the manufacturer rather than the consumer

Chemical preservatives have been admitted by decree of the Remsen Board

Important prosecutions in the courts drag interminably

### PURE FOOD LAW'S GREAT SERVICE

Labels have become, for the most part, honest—a great advance  
 Sanitary conditions of manufacture have been much improved  
 Many manufacturers have voluntarily abandoned the use of chemical preservatives  
 Cold-storage conditions have been largely improved  
 Three thousand cases of adulteration and misbranding have been prosecuted  
 The United States District Court of Indiana, and about half of the state food commissioners, have ruled against the use of benzoate of soda  
 The moral effect of the law has been very great

\* \* \*

Woman, Socialism and the coming elections divide the honors in the magazines this month, and of the three woman gets almost a better half. In the *American Magazine* there are articles in point, by Brand Whitlock and Helen Keller. The educated woman should, in Miss Keller's opinion, make it her business to know why millions are shut off from the full benefits of education. She should also know

"why a woman who earns wages has nothing to say about the choice of the men who make laws that govern her wages. We must know why a hundred and fifty of our sisters were killed in New York in a shirt-waist factory fire the other day, and nobody to blame. We must know why our fathers, brothers and husbands are killed in mines and on railroads. We women, who are natural conservationists, must find out why the sons we bring forth are drawn up in line and shot. We must organize with our more enlightened brothers and declare a general strike against war."

\* \* \*

In the *Forum* Anna Garlin Spencer reviews women's historical relation to government and maintains that the new motherly functions of the modern state—the care of the young, the old and the handicapped—demand that woman be raised from a position of subordination to an equal part in the management of the state. In the *World's Work*, Mabel Potter Daggett and in the *Ladies' Home Journal* Edith Rickert tell how successfully organized womankind in America has performed the distinctly feminine function of sanitary engineer in various communities, and has made for herself "a name in the housekeeping of the nation."

\* \* \*

To the *Atlantic Monthly* Ellen Key contributes an article on what is, in her opinion, the true motherhood, the race motherhood for which she believes the social instinct of today is laying the foundations. A woman with such a race-motherly instinct is described by the *World's Work*. She is Lydia Holman, whose nine years of nursing in the southern mountains has led the Red

Cross to organize a Rural Nursing Service. Miss Holman tells how the call to social service—race maternity, to use Miss Key's phrase—may grow out of the individual needs of the child-bearers:

"Motherhood on a mountain top in a cabin with other children for the mother to care for whilst the husband travels for miles to secure the services of the nearest 'likely' person, be it doctor or only neighbor; alas! for American motherhood in isolated rural communities! This phase of the problem alone convinced me that my work was here."

To the periodical literature of the "new woman" Thomas A. Edison adds his contribution in *Good Housekeeping*. There is much common sense, but perhaps a hint of unconscious humor also, in his prophecy that thanks to his electrical contrivances to lighten the drudgery of housework the woman of the future will be able to take her place beside man and will become the mother of a "race of mental prodigies."

\* \* \*

William Hard records in the *Delineator* the endorsement by organized women, at the last convention of the General Federation of Women's Clubs, of the objects of his Home League. These objects are to find what are the laws regulating the rights in the relations of husband, wife and child in the various states, and to so remodel them, where they are antiquated and unjust, that the wife shall be as free as her husband, and shall have the same right to her children.

\* \* \*

The *Metropolitan* and *Pearson's* present campaign articles for the Socialists: Morris Hillquit's outline of the practical program of Socialism, and Allan L. Benson's contrast between its aims and those of Progressivism as he sees it. Mr. Benson's view may be shown by two paragraphs:

"Radical politicians do a lot of temporizing. Even Lincoln temporized with chattel slavery. When he ceased to temporize he struck down chattel slavery. Then he ceased to be a radical and became a revolutionist. The time for radicalism had passed . . . .

"Wage slavery is as much greater than chattel slavery as the white people in this country are more numerous than the black."

\* \* \*

William English Walling, in the *Twentieth Century*, holds state Socialism to be the goal of the Progressive movement and pictures its dangers in the eyes of an "industrialist" or member of that branch of the minority wing of the Socialist movement which looks to industrial equality with political revolution.

In the same magazine Eugene V. Debs, Socialist candidate for president, essays to show that as judge President Taft reversed the phrase of Lincoln, and put "property before life; the dollar before the man."

By a coincidence President Taft's brief against Socialism is published in the *Century*. Charles Edward Russell, who has in other places treated of the defects of government ownership, shows in *Pearson's* the "altruistic side of the state railroads of New Zealand," and J. W. Whelply, in the *Century*, criticizes the much praised thrift of the French which he holds has kept France behind the other European nations in her national development, and has, in his opinion, been largely responsible for the strength of Socialism as a protest against a "narrowing of her national life."

The *International* fills its pages this month with the subject of the American Democracy in its relation to progressivism, socialism, syndicalism and monarchy—the latter a possible antidote in the opinion of T. Everett Harry for the dangerous radicalism of the day. The Relation of Syndicalism to Socialism is the subject of an article by Robert Rives Lamont in the *International Socialist Review*.

\* \* \*

Interesting articles the current month in the field of sanitary concern, are the *World's Work's* short account of the work of Gaston Odin in isolating the cancer germ and his experiments with antitoxins. Dr. Odin's work gives promise of help in the future; Annette Austin's article on Cancer in the *Delineator* seems of more immediate help. It treats of measures too little used by cancer sufferers and by a medical profession only just beginning to awake to the possibilities of prophylaxis in this disease. Prophylaxis in another class of equally dreaded but even more common diseases is the subject of William Lee Howard's article on the Passing of Prudery in *Pearson's*, as well as Bertha H. Smith's article in the *Forum* on the teaching of sex hygiene. Neither of these is, however, as effective a document in the campaigns for health and morality as the anonymous autobiographical account the *Forum* publishes of a victim of syphilis. Her Spartan recommendation against infection is that syphilitics be isolated, "just as lepers are."

\* \* \*

Other leading articles of the month are Jacob H. Hollender's program, in the *Atlantic*, for the gradual abolition of poverty; the *American's* story of the insurgent movement among the stockholders of the steel corporation for better labor conditions; articles on the various aspects of the problems of congestion and of rural depopulation in the *Atlantic* and *Holland's* (Texas), and on the allied subjects of good roads and irrigation in the *Review of Reviews*, *Sunset Magazine* and *World's Work*.

*Holland's* also has a very entertaining account of a unique New York charity, Arbuckle's Deep Sea Hotel, where young men and women can, the writer tells us, live without that convent separation of the sexes that is characteristic of most semi-charitable boarding-houses, and can mingle in a healthy social intercourse that makes them indifferent to Coney Island and the city dance hall.

## HOME ENGINEERING

### A LETTER AND SOME ANSWERS

#### TO THE EDITOR:

I would appreciate your kindness if you could suggest what might be done along the line of making homes more attractive, so that children might be induced to stay at home more, especially in the evening. For instance, what might an active and influential woman's club do in a city of twenty-five thousand to help create and add to the happiness and attractiveness of a larger number of homes—with special reference to young people? I realize how general and indefinite these inquiries are. It has seemed to me that there has been such a tendency to attract men, women, and children away from their homes that a movement "back to the home" would be of the greatest importance, and I have been trying to learn of practical methods for carrying on such a movement.

WILLIAM C. DUNBAR.

[Probate Judge, Ada county, Boise, Idaho]

\* \* \*

The question of making homes attractive lies in the hands of women. The woman is the heart of the home. If she is attractive, her home is attractive when she is in it. The woman who is desirous of holding her errand boys and men-folk in the home will have to put her attention strongly upon the subject. She must study the needs of her charges, enter sympathetically into their tastes, and provide for their exercise. This for men-folks. In the case of boys, I see nothing for it but positively to forbid their wandering. There is something exciting in the very fact of being out in the night. If boys are allowed to taste it, they readily form the habit of looking to night time for excitement—from which habit much evil may spring through all their lives.

The curfew has much to be said in its favor.

As for the woman who herself wishes to wander, who needs to have home made attractive for her in order to be induced to stay in it—why, pray for her! She is past all other help.

PRESTONIA MANN MARTIN.

[Author of *Is Mankind Advancing?*]

\* \* \*

The encouragement of a love of home is greatly needed, for the outside attractions have become so numerous that many who have seen the effects realize that the time has come to develop and strengthen home ties rather than to weaken and disrupt them, as is the case when children look for all their social life to outside sources.

A woman who for many years had been active in girls' clubs said that she found they had a tendency to make the girls dissatisfied to be at home, and to share with their mothers the home duties which are the best preparation girls can have for home life as wives and mothers. They craved excitement every evening beyond that the home could supply,

and in the making of friends who were unknown to their parents were frequently subjected to grave dangers. The same result has been observed by thoughtful men and women in connection with work designed to be of benefit but which nightly induces both parents and children to seek their pleasures outside the home circle. If these centers were open but one evening a week this objection probably would not apply.

There are many schemes for civic and social betterment which on the surface seem valuable. The only way to judge of their efficiency is to study the results and carefully weigh them.

No scheme for social betterment that ignores the home as the natural center of attraction can be of permanent value. Parents need to realize that part of their duty as home-makers is to make the home attractive to the children not only in childhood but as they grow into young manhood and womanhood. Immersed in business, and often laden with many cares, fathers and mothers fail in this important part of their duty. However small the home may be, this is possible, but in many cases the parents must be shown how to interest their children and imbue them with a love of home. The Mothers' Congress provides in its program for mothers' and parents' circles the topic How to Make Home Attractive to Young people, and is everywhere emphasizing this and explaining how it may be done.

A woman's club could do much to promote the sentiment of responsibility and show how to do it by a series of meetings, in different sections of the city, to which parents would be invited. In Boise there are many mothers' and parents' circles whose officers and members would be able to take up this work.

HANNAH K. SCHOFF.

[President National Congress of Mothers]

\* \* \*

The majority of children go out on the streets because their homes are unattractive. The boy goes because he craves action and wants excitement, the girl because there is no room in which she can see her company. She is ashamed to ask her boy friends to a room which is too often filled with the family washing.

This drying of the clothes in the living room is unfortunately a necessity, and it has occurred to me that if public laundries could be established in our cities where women could take their clothes and wash and dry them, taking them home to be ironed, it would obviate this unpleasant drying of clothes at home.

Such a laundry could be undertaken by a woman's club. It would, of course, have to be advertised among the people who are in need of it and be made popular in some way. A small charge might be made for its use, and in many ways it would tend toward making the home more attractive.

Of course, the whole question of the home goes back to the erecting of such buildings as are fit for the housing of human beings, and I believe that a woman's club could do no better work than try to secure legislation which would provide for the erection of such

tenements as have recently been built in Germany. Here the buildings are a pleasure to the eye; there are courts where the children may play; balconies where the tenants may walk, and all the light and air and sunshine which are the working man's right and which are so necessary for the well-being of his family.

In such tenements the boy has space for play and opportunity for exercise, and the girl takes a pride in her home and is eager to ask her friends to share its hospitality.

LOUISE DE KOVEL; BOWEN.

[President Chicago Juvenile Probation Association.]

\* \* \*

One essential with most children is a ready welcome for their friends into a home—or some part of a home—adapted to the taste and needs of children. Our homes are made for grown-ups. They are made before the children come, and they seem to be made over but slightly and grudgingly when the little ones arrive. The child does not find his normal habitat amid the staid and easily upset surroundings and people in the living-room, and children's playrooms are few and far between; and barns—how I remember our delightful barn!—are distinctly on the wane. One might as safely romp around the sacred contents of a garage as in the purlieus of a grand piano.

I have in mind a singularly charming home where the two little boys live all over the house and there is not a jerkable tablespread or a joggly vase or piece of bric-a-brac anywhere within reach. The dog brings in some little dirt, but his antics with the children bring in, also, much hilarity. These boys have in the friends they want; not "suitable companions," prescribed, like medicine, because supposed to be "good for them." The parents rightly think that nothing very much amiss will happen without their knowledge so long as the children are at home. A carpenter bench and turn-pole in a light, dry basement, popcorn facilities in the kitchen, and stories of adventure read aloud to a lot of little human quadrupeds around the family fireplace—these charm even the dread leader of "the gang" into a nice peaceable child.

The thing that quickest drives a boy away to the wild and "the gang" is lack of really congenial spirits and of freedom to "let off steam." Oh, to think of the countless hosts of fathers and mothers sitting in comfortable chairs on the safety valves and bewailing the waywardness of youth!

The parents in this family I speak of literally "live with the children," as Froebel exhorted; play with them, talk with them about the great and the little things of the day, and all the moral and spiritual questions which children invariably bring to intelligent and sympathetic parents. There is no problem about keeping these children at home as much as children ought to be kept at home. We want them to see some of the good shows and street pageants, do we not? Of course, a part of our work must be to make the street an extension of the home, and a relatively safe place for the boys and girls.

CAROLINE BARTLETT CRANE.

[Founder Kalamazoo Civic League; civic expert.]

## JOTTINGS

### IN THE WAKE OF THE FLOOD

The movements of the waters last summer during the greatest flood ever caused by the Mississippi River were heralded far and wide in the daily press; the movements of the population de housed were told in much less detail. In the final report on work done by the Red Cross during the catastrophe, written by Ernest Bicknell, national director, this phase comes into its own. The troubles of the farmers of that region are still current event. Mr. Bicknell gives the number of persons requiring temporary help in the form of food and shelter as 250,000, and the number for whom further help was needed in the form of seeds for planting, repairs to buildings and fences, furniture, clothing, farm implements and so on, at 50,000.

"From the beginning of this later work of restoration," writes Mr. Bicknell, "the principal and most urgent need was for seeds for planting. Much the larger part of the expenditures from the relief funds, following the closing of the camps, was for the purchase of seeds—cotton, corn, peas and millet. Throughout the southern and major portion of the flooded territory cotton forms the chief crop. The lateness of the season and the slow recession of the waters caused the keenest anxiety and suspense among the planters and small farmers. It was generally agreed that cotton must be planted before the middle of June in order to "make a crop." Would the slowly falling flood leave the land in time to plant cotton? For thousands the hope of the future hung on the answer to that question.

"Wherever a mound or ridge showed its muddy crest above the water, the watching farmer leaped upon it, dropped cotton seeds upon the half liquid surface and trampled them in with his bare feet or covered them by dragging logs or brush back and forth through the mud. If cotton seed is soaked in water over night and planted in wet ground the following day, its tiny green shoots will appear in two or three days. In this crude and hasty manner much cotton was planted at that critical turn of the season in which a day might mean the difference between independence and poverty. It will be readily understood that the farmers were anxious to get back home at the earliest moment possible. They did not wait for the water to leave their land but only until it had fallen enough to allow them to get into their houses. They wanted to be on the spot when the first land appeared. But thousands of the waiting farmers saw the cotton-planting season pass while the water yet stood deep upon their lands. Their next hope was in corn and peas which might be planted with some hope of a crop as late as July 1. And even this last hope died in the hearts of many in lower Louisiana before the last of the flood had gone. To those whose every opportunity for cultivating their lands was denied there remained the necessity of turn-

ing to employment elsewhere. Some found work in lumber camps and sawmills, some on sugar plantations, some went to other and more favorably situated plantations where labor was in demand.

"All through the time of suspense and during the periods of feverish activity when the planting for the year must be crowded into a few hours or days, the relief committees and the Red Cross were ready with supplies of seeds. Shipments were hurried from North Carolina and other states which raise a special quick-growing variety of cotton. The two chief centers for distribution were Baton Rouge, La., and Natchez, Miss., where active committees composed of business men who fully understood the best methods of handling seeds and who had an intimate knowledge of the needs, were in charge. With these committees the Red Cross was in the closest affiliation and through them the relief funds of the Red Cross reached and relieved the most urgent wants."

---

Statement of the Ownership, Management, etc., of THE SURVEY, published weekly at 105 East 22d street, New York, required by the Act of August 24, 1912.

Name of— Post-Office Address.

Editor, Edward T. Devine, 105 East 22d street, New York;

Managing Editor, Paul U. Kellogg, 105 East 22d Street, New York;

Business Manager, Arthur P. Kellogg, 105 East 22d street, New York;

Publisher, Charity Organization Society of the City of New York.

Owners: (If a corporation, give names and addresses of stockholders holding 1 per cent or more of total amount of stock.) Charity Organization Society of the City of New York; a charitable corporation, without stockholders, chartered under Chapter 139 of the Session Laws of 1882, of the State of New York; Robert W. deForest, 30 Broad street, New York, president; Otto T. Bannard, 26 Broad street, New York, vice-president; Edward T. Devine, 105 East 22d street, New York, general secretary.

Known bondholders, mortgagees, and other security holders, holding 1 per cent or more of total amount of bonds, mortgages, or other securities: None.

ARTHUR P. KELLOGG,  
Business Manager.

Sworn to and subscribed before me this 2nd day of October, 1912.

EDWARD B. BRUCH,  
Notary Public,  
Westchester County.

Certificate filed in New York County, New York  
Register No. 3225.

(My commission expires March 30, 1913.)

[SEAL.]

Form 3526.

THE FIRST INSTALLMENT  
OF A NEW DEPARTMENT  
*to be edited by*  
PROF. GRAHAM TAYLOR  
WARDEN OF CHICAGO COMMONS

This Issue Ten Cents

Two Dollars a Year

A JOURNAL OF CONSTRUCTIVE PHILANTHROPY

# INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

## Child Labor

National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y.

25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

## Child Helping

Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York.

Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

## Recreation

Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y.

Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

## Recreation Bibliography

Division of Recreation of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. Pamphlet containing a list of the more formal publications, with annotations, and an extensive list of magazine articles dealing with the subject of recreation. Price 10 cents per copy.

## Conservation of Infant Life.

American Association for Study and Prevention of Infant Mortality, 1211 Cathedral Street, Baltimore. Gertrude R. Knipp, Exec. Sec'y. Literature on request.

Studies preventable causes of death and illness; urges birth registration, maternal nursing, parental instruction.

## Mental Deficiency

The American Association for the study of the feeble-minded, publishes the proceedings and papers of its annual meetings in the *Journal of Psycho-Asthenics*. Address Dr. A. C. Rogers, secretary, at Faribault, Minnesota.

## Tuberculosis

National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M. D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual Transactions and other publications free to members.

## Sex Hygiene

Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies.

Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

## School Hygiene

American School Hygiene Association. Pres., David L. Edsall, M. D., Harvard University Medical School; Sec'y., Thomas A. Storey, M. D., College of the City of New York, New York.

Yearly congresses and proceedings.

## Conservation of Vision

American Association for the Conservation of Vision, New York, D. C. McMurtie, Acting Sec'y, 1 Madison Avenue. To prevent blindness and impairment of vision from diseases, defects, accidents and abuse. Literature and exhibits. Ten state organizations. Membership \$1. Charter \$5.

## Mental Hygiene

National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene, State Societies for Mental Hygiene.

## National Health

Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York.

To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

## Working Women

National Women's Trade Union League, to better industrial conditions through organization and legislation. Information given. "Life and Labor," events in industrial world. Three months for 25c. Mrs. Raymond Robins, Pres., 127 N. Dearborn St., Chicago.

## Women in Industry

National Consumers' League, 106 East 19th St., New York. Mrs. Florence Kelley, Sec'y. Annual Report and other literature free.

Minimum wage boards, protection of women workers, pure food, sweatshops, etc.

## Evening Clubs for Girls

National League of Women Workers

Hotel Savoy, New York. Organizing Sec'y, Joan Hamilton. Recreation and instruction in self-governing and self-supporting groups for girls over working age. Monthly magazine—"The Club Worker" Twenty-five cents a year.

## White Slave Traffic

American Vigilance Ass'n, Central office, 105 W. Monroe St., Chicago; Eastern Office, Library and Bureau of Information, 156 Fifth Ave., N. Y. Purpose: to suppress commercialized vice. Carries on investigations, assists in prosecutions, etc.

## Young Women

National Board, Y. W. C. A. 600 Lexington Ave., New York City. Pres., Miss Grace H. Dodge. Gen. Sec'y., Miss Mabel Cratty; the advancement of physical, social, intellectual and spiritual interests of young women. Official Publication, "The Association Monthly" \$1; free literature.

## Labor Legislation

Workmen's Compensation; Industrial Hygiene; Labor Laws.

Official publication: *American Labor Legislation Review*, sent free to members.

American Association for Labor Legislation, Metropolitan Tower, New York City. John B. Andrews, Secretary.

## Prison Labor

National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, 1st D. Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

## The American Seamen's Friend Society

Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y.

The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

## Short Ballot and Commission Government

The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

# INFORMATION DESK

Continued from preceding page

## Municipal Problems

National Municipal League, 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

## Charities and Correction

THE PROCEEDINGS of the National Conference of Charities and Correction sent free to each member. BUREAU OF INFORMATION on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 2, 1913.

## Charity Organization

Charity Organization Department of the Russell Sage Foundation, 105 E. 22d St., New York City.

To study, teach and publish in the charity organization field. Pamphlets on family treatment, community study, relief, transportation, etc., sent free.

## The Church and Social Service

The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service.

For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Ave. (at 18th St.), New York.

## Unitarian Social Advance

The American Unitarian Association through its Department of Social and Public Service.

Reports and Bulletins free. Lecture Bureau. Social Service Committees. Rev. Elmer S. Forbes, Secretary of the Department, 25 Beacon St., Boston.

## Social Betterment for Negroes

National League on Urban Conditions Among Negroes, 281 Fourth Avenue, E. R. A. Seligman, Chairman; G. E. Haynes, Director. Develops welfare agencies. Trains social workers. Aids travelers. Supports probation officers. Seeks industrial opportunities. Correspondence invited.

## Home and Institutional Economics

American Home Economics Association, for Home, Institution, and School. Publishes Journal of Home Economics, 600 pp. per vol. \$2.00 per year. Conducts Graduate School of Home Economics. Meeting: Boston, December 31, 1912—Address, Roland Park, Baltimore, Md.

## Aid for Travelers

The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex.

For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

## The Smoke Nuisance

Send 25 cents, stamps or coin, for American Civic Association Bulletin on "Smoke Abatement; How to Organize for Pure Air; Model Ordinances, etc." Address American Civic Association, 914 Union Trust Bldg., Washington, D. C.

## National Conference of Jewish Charities

Lee K. Frankel, president; Louis H. Levin, secretary, 411 West Fayette St., Baltimore, Md. Issues monthly "Jewish Charities," containing articles of interest to all concerned in Jewish social and philanthropic work. Subscription \$1 a year, includes membership in the Conference.

## Presbyterian Social Service

Bureau of Social Service, The Presbyterian Board of Home Missions; Rev. Charles Stelzle, Supt., 156 Fifth Avenue, New York.

Sociological surveys made. Clearing house for city problems of the Church. "Downtown Church" Labor Temple, New York. Literature free.

## Studies in Social Christianity

Oct.: Growth and Causes of Crime. Nov.: Treatment of the Criminal. Dec.: Prevention of Crime.

See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York City. Price 50c. per year.

## Methodist Social Service

Methodist Federation for Social Service; Literature; Bureau of Information, Speakers' Bureau; Reading and study courses; Invites all Methodists to extend its usefulness and use its facilities.

Rev. Harry F. Ward, Sec'y., 343 S. Oak Park Ave., Oak Park, Ill.

## Negro and Race Problems

National Association for the Advancement of Colored People, 26 Vesey Street, New York. O. G. Villard, Chairman, Board of Directors; M. C. Nerney, Secretary; W. E. B. Du Bois, Director Publicity. Publishes Crisis Magazine. Investigation, Legal Redress, Literature, Lectures, Lantern Slides.

## Probation

National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y.

Advice and information; literature; directory of probation officers; annual conference. Membership, 50 cents a year.

## City Planning

National City Planning Conference 19 Congress St., Boston, Mass. Frederick Law Olmsted, President. Flavel Shurtleff, Secretary. A Seminar for the Discussion of City Planning Problems. Publishes Annual Proceedings. Membership at \$5 a Year Includes All Literature.

## Organized Charity

National Association of Societies for Organizing Charity. Francis H. McLean, gen'l sec'y., 105 East 22d St., New York City.

To promote the extension and development of organized charity and of community co-operation in social programs, in the United States.

## Church and Country Life

Department of Board of Home Missions of Presbyterian Church. Warren H. Wilson, Supt., Anna B. Taft, Asst., 156 Fifth Ave.; makes sociological surveys of rural populations; conferences, graduate summer schools for country ministers, literature for rural workers.

## Baptist Social Service

Social Service Commission of the Northern Baptist Convention.

To study social questions, publish findings, suggest ways whereby Christian men may become socially effective, and co-operate with similar bodies.

S. Z. Batten, Des Moines College, Des Moines, Iowa, exec. ch'm.

## Episcopal Social Service

The Joint Commission on Social Service of the Protestant Episcopal Church.

For literature and other information address the Field Secretary, Rev. F. M. Crouch, Church Missions House, 281 Fourth Avenue, New York City.

## Immigration

National Conference of Immigration, Land, and Labor Officials, 22 East 30th Street, F. A. Kellor, Sec. Information affecting aliens *after admission*, especially in reference to labor, land, education, protection and distribution. No matters of admission or restriction dealt with.

## Remedial Loans

National Federation of Remedial Loan Associations, 31 Union Square, N. Y. Arthur H. Ham.

Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Each space like this, \$20 a year, to appear 12 times, once each month.

Would you hesitate to spend \$1.66 a month on circulars and postage to possible new members?

## THE PITH OF IT

THE growing co-operation of Protestant churches, the social pronouncements of the Catholic societies, one instance in which lightning flashed from a Jewish temple, and some first books of the churches' new social campaign—these are topics dwelt upon in Professor Taylor's new department of the Church and Community. P. 82.

A RECRUDESCENCE of the Malthusian fear was suggested by at least one speech before the American Public Health Association. P. 72.

MORRIS LOEB, of New York, who died last week, was widely known as a scientist, educator and philanthropist. Among many kindred activities, he had been president of the New York Foundation, of the Jewish Agricultural and Industrial Aid Society, a director of the Educational Alliance and one of the founders and patrons of the Solomon and Betty Loeb Memorial Home for Convalescents. Formerly he was professor of chemistry in New York University.

OUT of nearly twenty-five hundred women working in Montreal department stores, all but 3 per cent either support themselves entirely or aid in the family support. This is one more blow to the theory that such girls do not require a living wage because they reside at home. P. 63.

THE minimum wage: What it is and why it should be are answered by Arthur N. Holcombe, chairman of the special committee devoted to its propaganda by the National Consumers' League. P. 74.

ONE out of every three children born in the alleys of the national capital dies before it is a year old. P. 67.

THE Hull House Players, twelve "working people" who have been trained into a creditable group of actors, will spend six weeks next summer in the British Isles. P. 33.

IN codifying the laws of Ohio relating to illegitimate, defective, neglected, dependent and delinquent children, a legislative commission makes some sharp pronouncements. P. 64.

ONE of the services for which Dr. Alexis Carrel, of the Rockefeller Institute for Medical Research, was awarded the Nobel prize in medicine this month was his success in keeping the heart tissue of a chicken alive for 120 days after removal from the body. This has led to speculation in scientific circles as to whether "permanent life" might be made possible. Dr. Carrel is the first person in this country to receive the Nobel prize in medicine.

AT the second National Conference on Vocational Guidance, which will meet in New York October 23-26, sessions will be held on placement, occupations, scholarships, vocational analysis, opportunities for vocational training, methods of vocational direction, and the relation of the employer to vocational guidance.

THE Committee on Amusement Resources of Working Girls, of New York, announces five class lessons "in new social dancing to provide interesting and usable substitutes for vulgar dancing and to define socially correct dancing." The class is especially for men and women engaged in teaching or supervising in recreation centers and settlements, either volunteers or professionals; also those preparing for such work.

## THE COMMON WELFARE

### SUMMER ABROAD FOR HULL HOUSE PLAYERS

Inspired by their study and production of several Irish plays written by Yeats and Lady Gregory, the Hull House Players are planning to spend six weeks next summer on a trip to the British Isles. They became acquainted with the Irish Players who with Lady Gregory spent a month in Chicago last winter. Moreover, many of them are of Irish ancestry and are anxious to see the home land.

The Hull House Players are a unique group of twelve so-called "working people." Organized twelve years ago by Laura Dainty Pelham, and working harmoniously with her through all these years, they have taken so keen an interest in their work that they have come to Hull House twice a week for rehearsals, and oftener when necessary. Most of the money for their trip abroad they hope to earn by giving as many performances of their plays as possible this winter. Some money has been saved from last year and some of it they will provide from their own earnings. Although the summer season is unfavorable for the theater, it is possible that the players will give one or two performances of the Irish or Galsworthy plays during their visit. The management of the Abbey Theater in Dublin was very anxious to have them come earlier in the season in order that such an arrangement might be made.

Whether they play or not, they are anticipating the trip keenly because of the insight it will give them into the land and the people they have learned to know so well through the folk plays. In June they will sail for Queenstown, and will

visit Cork, the lakes of Killarney and other smaller places, and then will spend several days in Dublin. Then crossing to Liverpool, and stopping at Chester, Warwick and the Shakespeare country, they will make their way to London for an eight-day visit. In London they hope to see something of the settlements in Canningtown and to gain an insight into the setting of the English life so vividly portrayed by Galsworthy whose plays they have very successfully produced.

To Mrs. Pelham's years of devoted and unstinted services is due the spirit of unity and good fellowship which makes the history of this club, in the opinions of many persons, unusual in settlement annals; she also deserves much of the praise which the club has earned by its selection of plays and intelligent and sympathetic acting.

### WHY GIRLS WORK IN DEPARTMENT STORES

The claim so often made that girls in department stores do not require a living wage because they are living at home, has been punctured again by an interesting research made by Montreal young women. An association of department store girls organized for semi-religious and semi-educational purposes conducted an investigation for the Child Welfare Exhibition now in progress in Montreal. They secured responsible young women in each of the stores to make the rounds of their associations. The questionnaire was of the briefest possible kind, prepared by the director of the Child Welfare Exhibition and adapted to amateurs. The result showed that out of the 2,471 women employed in eleven stores in the city:

7 per cent were the sole support of their family  
 60 per cent were aiding in the family support  
 30 per cent were living alone and supporting themselves.

3 per cent worked only for pin money or clothing, making no contribution to the finances of the home.

The fact that a girl is living at home may mean that she is protected in her recreations and social engagements, but these Montreal figures add to the cumulative evidence that it does not mean that she can depend upon others for her support, and thus work for less than a living wage.

#### WHAT A STATE SHOULD DO FOR ITS CHILDREN

In codifying the laws of Ohio relating to illegitimate, defective, neglected, dependent and delinquent children, and in recommending revisions and amendments, the commission appointed for this purpose by the legislature of the state has taken a definite stand on more than one phase of child care that is now prominently in the public mind. Pensions to widows, labor on the stage, medical inspection in schools, supervision of institutions, and juvenile delinquency are some of the subjects to which the commission gives attention in its published report, the purpose of which is to bring the laws of Ohio into harmony with the best thought in this field. In general the commission recommends that existing laws be retained whenever possible, building upon this foundation such new legislation as seems necessary.

Ohio has fifty-five county children's homes supported by county funds, six others supported in part by county funds and one district home. Infants under one year of age are kept in the almshouses and transferred to the county homes thereafter. A part of all these children are placed out upon adoption. Besides the public institutions, there are the usual large number of private asylums and homes which also place some children out.

The report recommends a power of supervision on the part of the state over all public and private institutions for children, especially aimed as a means of following up a child after it is placed. The existing county children's homes, the report holds, should serve merely as temporary homes for children who may later return to their parents; as places to train and fit children for foster homes or to care for them while a foster home is being found; and as suitable asylums for children who are of too low grade, mentally or physically, to be placeable, and who should in the county homes mix with the normal and placeable children.

No new homes should be established without

the approval of the Board of State Charities, says the report. Physicians should be employed by these homes not merely to visit sick children but to make a careful study of each child and keep records of physical and mental condition. Teachers in such homes should have elementary school certificates and the public schools should be open to institution children if the management desires. Normal children should be admitted to institutions upon order of the trustees, that is, the overseers of the poor or of the juvenile court, but the juvenile court should consider each case and authorize commitment. The system of indenture is called, by the report, a kind of slavery and its abolition is urged. State supervision should extend to children placed out who should be visited by agents of the State Board of Charities, whose supervisory powers, the commission feels, should be increased in other respects also.

On the administrative side the report speaks favorably of the New Jersey system of children's guardians, but it does not consider a change to this system feasible in Ohio. Its recommendations are that, as under the Massachusetts law, the board shall receive as its wards dependent or delinquent children from the juvenile court, or from children's homes, houses of refuge or other institutions, with the consent of the court which committed them to such institutions. Such children shall be placed by it in carefully investigated homes, and board paid when necessary.

In the matter of reimbursement of the board by the county the commission recommends a plan like that followed in Indiana, which like Ohio has the county home system. This plan is that salaries and general expense shall be charged to the state; traveling expense referable to each child together with one-half the board, if any, paid for it, shall be charged to its county, the state to stand this expense, and then collect from the county instead of waiting until the county sets aside enough money for the purpose. State child placing is not regarded by the commission as inconsistent with but as an important supplement to placing by county homes.

Delinquent children are now sent by the juvenile court to the industrial school and reformatory, and there is no system of placing them in private homes. The report holds that the best cure for both dependency and delinquency is to place the child in such an environment as will tend to make him independent and honest. In this connection, however, it says of both classes of children:

"We believe that most institutions are infinitely to be preferred to a loose and careless system of placing children in homes. One hesitates to think what may happen to the helpless child

farmed out as a slave and drudge, with no one in all the world to care what becomes of him."

The age for delinquency should, the commission feels, be raised to eighteen. To the legal definition of a delinquent child, an amendment would add children who frequent moving-picture shows or who are habitual truants. Another important recommendation is that providing that parents or guardians shall be held liable as contributory causes of delinquency. Again, persons charged with abuse of a child or acting in a way tending to cause delinquency shall be subject to arrest and trial.

Under the subject of "offenses against children" the commission recommends a law prohibiting children under the age of fourteen years from appearing on the public stage.

"There are perhaps exceptions to the general rule that stage life is harmful to a child," says the report, "but it must follow in the majority of such cases that such a life is one of overstimulation and fatigue for a child and tends to pervert it morally away from wholesome ideas."

Upon the subject of child labor and compulsory education the report tersely says:

"The old system under which the child was unduly exploited for the benefit of industry and its parents is rapidly being done away with. We believe that the enactment of such a measure as the Uniform Child Labor Law of the National Child Labor Committee, as a whole, is inevitable in every progressive state in the Union."

Because of laws existing in Ohio the commission does not follow this uniform measure, but proposes additional provisions not in the uniform law. These relate to vacation certificates, examiners to pass on the fifth grade requirement, penalizing the making of false affidavits and statements in order to obtain working certificates for a situation for a child under the required age.

The report recommends that permissive medical inspection of school children in cities be made compulsory and general throughout the state, in rural as well as urban communities. Such legislation, it is contended, will serve not alone to safeguard the health of communities, but to discover and remove the causes of apparent backwardness in children. It should also bring to light the large number of children of mental deficiency who need special treatment under custodial care.

It hesitates to recommend sterilization and falls back upon segregation of certain classes of children. This it admits will involve great expense, but "the longer it is deferred the greater the expense will be."

One of the most interesting recommendations relates to the mothers' pension. Upon this subject the commission says:

"Widows' pensions are provided for in section 1683-2 to 1683-9. These provisions are modeled after those of the Missouri statute, but contain several additional safeguards. The following conditions precedent to the receipt of such pensions are described. Women having children, whose husbands are dead, disabled, or imprisoned and not contributing to their support may receive from a special county fund upon order of the juvenile court an allowance of \$15 for a mother and one child, and \$7 for each additional child; provided, upon investigation of the court, associated charities, or other organization, it is found that such a pension will be necessary in order to hold the home together, that it is a fit home for the child, that the mother will thus be enabled to stay at home, where she may both work and look after the children every day except one for work outside. The allowance can be renewed only upon investigation and will cease when the child becomes fourteen years old.

"While your commission is not unanimously agreed as to the desirability of any enactment of this kind, it is agreed that should any be passed, it should be in the form above outlined."

#### NEW WORK FOR MENTAL HYGIENE

The Committee on Mental Hygiene of the New York State Charities Aid Association, now entering upon the third year of its work, is increasing the scope of its activities by undertaking on a larger scale medical social service work with incipient mental cases.

In co-operation with the Manhattan and Central Islip State Hospitals, the committee opened this month a dispensary for nervous and mental diseases at 295 Henry Street, to be known as the East Side Clinic. This will be open every day in the week but Saturday and Sunday. The large staff and the number of hours that the clinic is open make possible the careful treatment of a considerable number of mental cases. It is expected that when the plan is well under way patients will be referred to the clinic by social workers and agents of various charitable organizations. Many will come directly as a result of information received from friends or relatives, and from press notices. Others will be referred by the Nurses' Settlement which is close by. It is expected also that arrangements will be made with some of the near-by general dispensaries for referring their mental cases to it.

In addition to the patients coming from these

various sources it is planned to have many of the recovered patients discharged on parole from the Manhattan and Central Islip State Hospitals report there during parole period. A recent law provides that the hospital superintendents may at their discretion discharge any of their patients on a parole varying from one to six months. The parole period is designed to be a trial home visit and is given in cases where the patient is not entirely recovered, or if entirely recovered, needs some medical guidance for a few months after the regular hospital treatment is discontinued. The parole system has not met all the expectations of those interested in its establishment, for the reason that it has been impossible in most of the hospitals to induce more than a small percentage of patients to visit the hospital in person during their parole period for the purpose of receiving medical advice. It is thought that many more will visit the clinic than would go back to the hospital because of its greater inconvenience and also because many patients would be more willing to attend a medical station outside of the state hospital limits.

The medical social service work with incipient cases began recently when Katharine Tucker became assistant on the staff of the committee. The wide distribution of literature on the causes and prevention of insanity during the past year has resulted in a large increase in the number of individuals making application for advice and information. Miss Tucker, who graduated from Vassar in 1907, received her R. N. from the Newton Hospital in 1910. Later she did volunteer work in the social service department of the Massachusetts General Hospital and then took charge of the tuberculosis social service work in the University of Pennsylvania Hospital in Philadelphia. Following that she had charge of the social service department of the New York Dispensary. Miss Tucker will interview patients suffering from incipient mental diseases in their homes, in the office and at the dispensary. A careful study of the environment and family history will be made for the purpose of doing all that can be done to check the approach of mental trouble. Accurate records will be kept of the histories of these patients for their immediate value in solving the individual problems and for the purpose of demonstrating the value of social service work in the prevention of mental diseases. These records may also be used to furnish scientific data on the relation between heredity and environment and the causation of insanity.

The committee is also establishing a bureau of information on the causes, prevention and treatment of insanity, will furnish promptly upon application from any part of the state of New York advice as to what steps should

be taken in securing the examination and treatment of persons apparently suffering from mental disease; what public and private hospitals in any given locality treat mental diseases; what means are available for obtaining in any locality competent medical treatment of cases of mental disease in their homes or at dispensaries; recent literature and addresses by authorities upon mental hygiene and the causes and prevention of insanity.

#### A CO-OPERATIVE GROCERY IN BOSTON

The city of Boston has just seen the establishment of a co-operative store following the model of the Rochdale institution. Some five hundred employes of four mercantile establishments have organized what is to be known as Everybody's Co-operative Grocery Store. Two classes of members are provided for by the constitution: directing members, limited to the payroll employes of the four establishments, and participating members who are not so limited. The rights and privileges of members of each class are identical except that only directing members have a right to vote.

The business of the association is conducted by a Massachusetts corporation with seven stockholders who hold their stock as trustees for the association and its members and act as directors of the corporation. These stockholders are elected by the directing members and may be removed by a three-fourths vote. Each member, directing as well as participating, pays a membership fee of five dollars which entitles him to share in the profits of the establishment, and the store's net earnings are distributed among all the members in the proportion that the purchases of each bears to the total sales.

The association operates under a strict rule of cash sales and is starting its career under no load of office expense, only the ordinary wages being paid. But one salary is paid and that to the superintendent, this, however, being no more than a similar position would carry in any establishment.

The constitution provides that 5 per cent of the earnings may be set aside for educational purposes, and 10 per cent for a reserve fund to be used at the discretion of the stockholders, and intended chiefly as a protection against unexpected demands.

The establishment of this institution is due largely to the initiative of William E. Butler who, in conjunction with Ralph Albertson, not only is largely responsible for the plan followed, but made its speedy accomplishment possible by the loan of \$10,000 to the association.

# CIVICS

## THE ALLEY HOMES OF WASHINGTON

THOMAS JESSE JONES

CHAIRMAN OF THE HOUSING COMMITTEE OF THE MONDAY EVENING CLUB, WASHINGTON, D. C.

After forty years of agitation and search for ways and means to eliminate the blind alleys of Washington, they still remain to spread crime and disease throughout the beautiful city and its inhabitants. Two startling facts should have swept these alleys out of existence years ago. One out of every three children born in these by-ways dies within the first year of life. To make matters worse these houses with their diseases and crime fill the center of many blocks rimmed with splendid houses and hotels.

A glance at the map of Washington shows the dangerous proximity of these disease centers to the best residential blocks of the city.

Blocks containing inhabited alleys are indicated in black on the map below. The transverse lines divide the city into the four well-known sections with the capitol buildings at the center. According to this map, based upon official records of the District of Columbia, no part of the city south of Florida Avenue is free from the contagion of the alley. Even the White House, and the northwest section, famous for its palatial homes of national rulers and foreign ambassadors are not free from these menacing blots. In this section, the dwelling place of the élite, there are 161 blocks with alleys containing 1,940 houses. Only a narrow street separates the magnificent marble offices of the United States senators from Schotts Alley where, during the Christmas holidays last year, a drunken brawl ended in murder. In the southwest the alley blocks extend in almost solid color to the grounds of both the national capitol and the

White House. Altogether there are in the city 275 alley blocks containing 3,337 dwellings and approximately 16,000 inhabitants.

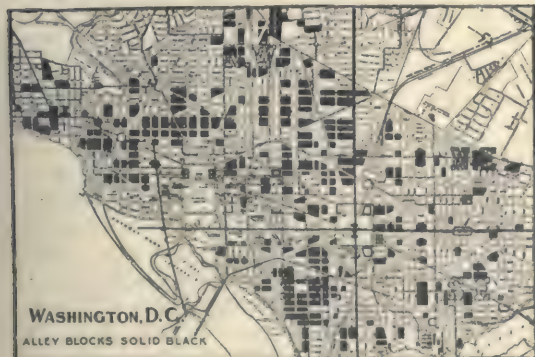

The report of the health officer of Washington for 1910 gives some significant figures on health conditions in the alleys. The following table presents a comparison of the number of deaths per thousand persons for streets and alleys:

DEATH-RATE PER 1,000		
AGE	ALLEYS	STREETS
All ages .....	30.09	17.56
Under 1 year .....	373.49	158.66
1 to 4 years .....	30.82	16.75
5 to 20 years .....	7.84	5.25
Over 20 years .....	27.05	18.08

The most striking difference in these rates is that for children under one year of age. According to the health officer, 373 alley children out of every thousand under one year old die every year as against 158 deaths of children living on streets. In other words, for every three deaths of infants living on streets, there are seven of alley children. For all ages it is seen that there are thirty deaths per thousand among alley dwellers while there are only seventeen per thousand of the street inhabitants.

The menace of the alley is further seen in the following four most common causes of death in 1909. The figures in the table state the number of deaths per 100,000 of street and alley residents.

CAUSE OF DEATH	WHITE		COLORED	
	ALLEYS	STREETS	ALLEYS	STREETS
Pneumonia .....	310.9	117.9	432.8	188.1
Tuberculosis ....	186.5	121.2	621.3	433.7
Whooping Cough?	62.2	5.3	21.9	15.6
Diarrhoea				
(Under 2 years)	62.2	36.8	321.6	137.8

WHERE EVERY THIRD BABY DIES.

October 19, 1912.

For the white population the highest death rate is caused by pneumonia; among the colored people tuberculosis leads with the high rate of 621 deaths per 100,000. In every instance the rates are higher for the alley population than for

AN UNTRAINED, BUT WILLING NURSE.

the people living on the street and, with one exception, the mortality of the colored people exceeds that of the whites.

Significant as these statistical comparisons are as a measure of unnecessary suffering and needless loss of life, they are far more significant—they are even startling when they are understood as a measure of contagion and infection from the alley inhabitants to street population. Fortunately or unfortunately, I am not sure which, the insanitary houses of most cities are localized in certain sections away from the homes of the prosperous. This separation affords some protection. In Washington this is not the case. The alleys are in every section south of Florida Avenue. Disease in them, therefore, means more than the suffering and death of alley population; it means the possible and even probable infection of the comfortable and supposedly sanitary houses of the streets. One need only recall the typhoid fly and the malaria mosquito and their trips from the house of the poor to the house of the rich to realize the close relationship that may be established between the consumptive of the alley and the resident of the street.

One of the obstacles to the reform of these conditions has been the inability of many people to understand the real complaint against the blind alley. These people visit the alleys and find many of them paved. In increasing number water and sewer connections are being made. The substantial brick houses to be found in a large number of them help to allay the anxiety of this occasional visitor, and he is quite apt to return from his slumming trip with the feeling that the dangers of alley life have been exaggerated. Such a visitor misses the real danger of this blind street formation. The most potent cause of disease and crime in these places is not a lack of paving or a lack of water or a lack of sewerage facilities—but seclusion from the helpful criticism of the passer-by, seclusion too frequently from the overworked building inspector and health agent, seclusion from the policeman whose large beat does not allow time to enter every alley. Seclusion is the almost in-

evitable consequence of an alley with the usual H formation. Some have a much more irregular shape.

On the straight street one policeman can keep several blocks under his observation. In the H-formed alley, it is necessary for him to enter every part of each alley. Seclusion is the explanation of the alley house which "looks all right but isn't." These were the significant words of a regular visitor to one of these fairly respectable looking little brick houses in which there were five cases of tuberculosis and two deaths in one year. Could we add to the definite statement of the alley deaths, an equally definite measure of the crime in these hidden corners, scattered throughout the city, the picture would be even more startling. As it is we can only give the testimony of the policemen on the beat who are always complaining of the difficulty of giving effective attention to the blind alley and who in the southwest always go in pairs after nightfall.

Objectionable and dangerous as these alleys have been since the Civil War, the history of the effort for legislative treatment of the condition is a story of forty years of struggle which has borne but comparatively little fruit. On almost every occasion the forces of selfishness have succeeded in overthrowing any appeal to Congress for a systematic treatment of all the blocks infected with these by-ways. It was in 1872 that the first act providing for the condemnation of insanitary dwellings became effective. This act was in force until 1880 when greed succeeded in having the act omitted from the health regulations of the District. After twenty-six years of inaction, the condemnation power was re-enacted and vested in the Board for the Condemnation of Insanitary Buildings (May, 1906). The work of this board in regard to alley houses from 1907 to the present year is summarized below:

YEAR	NUMBER OF ALLEY HOUSES		
	EXAMINED	REPAIRED	DEMOLISHED
Total .....	582	315	375
1907 .....	175	33	89
1908 .....	156	64	124
1909 .....	79	50	52
1910 .....	94	97	68
1911 .....	78	71	42

According to this table an average of seventy-five alley houses have been destroyed annually during the last five years. At this rate it will be at least forty years before Washington is rid of the 3,337 houses now forming these 275 dangerous centers of contagion. Other than the re-enactment of the condemnation law, only one act affecting the general alley situation has been

passed since the Civil War. This was the law of 1892 forbidding the construction of dwellings in alleys less than thirty feet in width.

An adequate record of the various movements for eliminating the alleys of Washington would require pages. The continued services of Dr. Kober and General Sternberg in this cause merit the gratitude not only of citizens of Washington but of all who are interested in the sanitation of the national capital. Undoubtedly the most effective presentation of this problem has been made in *Neglected Neighbors* by Charles F. Weller and in the report of the President's Homes Commission in 1908. Yet even these stirring publications together with the testimony of Jacob Riis that the Washington alley is worse in many respects than the New York tenement did not result in any organized effort to change the alleys into minor streets or eliminate them as dwelling places.

Of the 258 inhabited alleys in Washington today there are

88	that	contain	from	1	to	4	houses	each
70	"	"	"	5	to	9	"	"
34	"	"	"	10	to	14	"	"
24	"	"	"	15	to	19	"	"
36	"	"	"	20	to	29	"	"
23	"	"	"	30	or	more	"	"

The alley problem has confronted the citizenship of Washington and the patriotic citizens of the land for forty years. Some progress has been made in the improvement of the inhabitants of these places by the Associated Charities and by the churches. Every department of the District government is doing better work than ever before, though they are seriously handicapped by the inadequacy of their inspection force. Special praise should be given to Dr. W. C. Woodward, the District health officer, who against the odds of insufficient appropriations and a small number of inspectors, has succeeded in reducing the death rate and improving health conditions even in the alleys.

Some alleys have been eliminated to meet the demands of commercial enterprises. One disreputable place was converted into a minor street by assessments upon neighboring property equal to the cost involved in the change. Further application of this method was stopped by a Supreme Court decision in 1907 which cast doubt upon the legality of this form of assessment. At the last session of Congress \$78,000 were voted for the change of the most notorious alley in the city into an inner park. This year the commissioners are planning to attack four more alleys.

But in spite of all these accomplishments and plans, there is no plan to attack the problem as a

whole. A careful study of the whole situation leads to the conclusion that the final solution of the alley problem awaits the aroused public interest of the nation. Let us add to our plans for a city beautiful, a demand for a city pure. Let the women's clubs of the land, the civic associations of the nation, and political organizations of every state and city unite in the call for a national capital that shall be both beautiful without and clean within.

## A WASHINGTON ALLEY

WILBUR VINCENT MALLALIEU

Snow's Court is a labyrinthic interior alley in the center of a large city block. It has one entrance, a twenty-foot passageway leading from the thoroughfare, although there is another ingress for the initiated through a private five-foot alley winding in from Second street. This particular court has been a festering sore in the District of Columbia for years. Old inhabitants say that it has been notorious as far back as they can remember. Charles F. Weller in *Neglected Neighbors* in the National Capital says it illustrates the failure of the retail method of dealing with the complicated alley problem. In this book he shows that in 1908 after four years of agitation, the only improvements made were "the reduction of the number of people sleeping in a pestiferous barn and the demolition of seven extremely dilapidated shacks." Since 1908 no advance has been made and the conditions condemned in 1905 still exist.

The court consists of forty-seven houses in eight separate rows facing five distinct alley streets. There are many blind pockets and hidden ways

SMOTHERING THE SMELL WITH A BLANKET  
The linen of the prosperous hangs in the stench.

amid the irregularities of the fences. Most of the buildings are brick, but there is one row of "shabby frames which are like the rough shanties of a lumber camp," only less sanitary. According to the police census of 1909, the latest figures obtainable, there were living in the court 204 persons, three of whom were white and the rest colored. All the inhabitants are colored with the exception of the family which keeps a little store.

The location of the court is strategic because of its relation to a large colored population to the west and southwest of it. It is almost immediately connected with Hughes Court, another interior alley. The two form one underworld community. The situation is also strategic because it is near a prosperous part of the city, which must be kept from retrogression. Within a radius of little over a block, there are eight well-known public institutions.

As to health conditions, while the death rate for the alley dwellers is higher than that of the street dwellers, in the Health Department's subdivision district in which Snow's Court is situated, the death rate for the colored alley population is even higher than that for the city at large. In 1909 the death rate per thousand for the alley colored for the whole city was 31.94. For this particular district it was 34.14.

The sanitary inspector never visits the court without finding something wrong to report. His note-book is full of entries relating to filth and disordered plumbing. He has recommended that the wooden houses be removed and also that the whole place be cleared out for an open court or possibly a playground. But as the owners or agents of the property keep up repairs above the minimum required by law, nothing has resulted from his suggestions.

Other social workers have also recommended the demolition of several of the houses but without success. They urge that a house may be safe from a builder's viewpoint and yet totally unfit for human habitation owing to long continued infection. The rotten houses and filthy sanitary arrangements here are such disease breeders that nothing but destruction could ever disinfect them.

It is the opinion of the instructive nurses that Snow's Court is one of the worst in the city. "They groan whenever they hear of anyone moving in." There are always cases for the baby nurse and the tuberculosis nurse. In the recorded cases of last year, which is but a small proportion of the total number, there were four of tuberculosis in different houses and ten calling for the care of babies, several of whom died. One case on file is that of a woman who has brought into the world her seventh illegitimate child. Practically every house in the court has been entered on call by the regular nurse within the past year.

As most of the people in the court are either laborers or servants, and are usually in demand, the economic situation is not so acute. Yet even in this respect there has been need of help. Twelve families were cared for in the past year. In one house the father died two years ago leaving six children. The oldest, a girl about sixteen years of age, had been ill for two months when the visitor was summoned. She lay upon a couch in the front room exposed to every one passing. Recently when the visitor was present, three men came in who evidently were very much at home. A fourth shied off when he noticed the stranger. The widow is now an expectant mother. The family pays \$9.50 per month for four rooms and a shed kitchen which is in miserable condition. The backyard was full of ashes and trash. Yet linens laundered here are beautifully white and well done. They are kept in the room with the sick girl who is suffering from glandular tuberculosis.

Another mother was left a widow last September and moved into the court in November with her four children ranging from a girl of eleven to a boy three weeks of age. They have two wretched rooms for which they pay six dollars. The back room is used for a kitchen and dining room and the front room as a bed room for the entire family, including an aunt who is a confirmed drunkard. When the visitor first entered this house, the kitchen was piled up with cinders, ashes and pans of garbage from which food was being picked for the children. There was one bed and a couch which opened out to a half-bed, a small stove, a broken chair and a cupboard for food, all in the most filthy condition imaginable. The drunken aunt takes care of the children while the mother works as a vegetable cook in a cafe. It is thought that this aunt is a distributor of cocaine but no definite proof has been obtained. The attention of the Associated Charities was first called to the family by a report that a twelve-year-old girl was found begging in one of the parks. It was the oldest child who was relating a false story.

The moral conditions in such a secluded inclosure as this court can scarcely be imagined. The police who have to do with it agree in speaking of its disreputable character. One officer has remarked that it is the worst place in the United States and that there is no crime unknown to it. The police blotter of the precinct shows that from March 1, 1911, to March 1, 1912, there were 114 arrests among the 204 men, women and children living in Snow's Court. The charges were drunkenness, disorderly conduct, assault, unlawful assembly, larceny, cruelty to animals and accusations relating to sexual crimes. Nor does this number of cases represent all the evil, because it does not take into account residents of Snow's Court arrested in other precincts, nor does it include the mischief done in Snow's Court

by inhabitants of the neighboring alleys and residents of other parts of the city.

The probation officer of the juvenile court considers the alley one of the worst in the District. She has visited it at night and has seen it at its worst. According to her report, in the summer, the backyards are often veritable beer gardens with beds, tables and chairs. Young people congregate here unsupervised by older persons. Cases have been brought before the court for fornication and a number of women are criminally syphilitic. Young men loiter about the entrance to the court. Cocaine is sold under the name of candy but the guilty persons have so far escaped conviction. There are three saloons in the immediate neighborhood.

On the front of one shack there was formerly a crude sign reading, Charitable Baptist Church, and announcing services. Report declared that the man in charge was "not capable of doing any body any good." The Alley Improvement Association has been holding a Sunday-school in Snow's Court for the past three years. While the officer of this association has no interest in singling out this court as a locality of specially deep depravity, he says that it is as bad as any in the city. Every one with knowledge of alley conditions speaks of this court as superlatively bad. The Sunday-school under this association is in charge of two students from Howard University. The work naturally is carried on under difficulties. Sometimes after a woman has granted the use of her front room for the meeting, her husband comes in crazy drunk and breaks it up. Once a service was conducted in a crowded room with the head of the house lying dead drunk on the hearth. To leave this house for another was to fall perhaps into something worse.

Does this work do any good? Undoubtedly. Men, women and children have been led out to churches, better Sunday-schools and good influences, which in all probability would never have reached them but for the religious effort in the alley itself. But does this work solve the problem? Not in the least. For as fast as any one is benefited and has kindled within him the desire for a better way of life, he moves out of the alley. In this he is rightly encouraged. But others move in and the conditions remain unchanged. The simple folk from the country who take their places are most vilely corrupted by influences many times stronger and more continuous than those of the Sunday-school. The situation is like that of a leaky boat where the water rushes in faster than it can be dipped out. The trouble is not that there are no agencies hard at work bailing. The real difficulty is that the boat is rotten.

Snow's Court is a peril to our capital's life. Only an awakened public conscience that shall demand the abolition of this and other pest centers will rid the city of very grave dangers.

## JOTTINGS

### TOWN PLANNING IN FRANCE

The chorus of praise and comment on the town-planning act of Great Britain has made people overlook the fact that France has its counterpart in the Beauquier town extension bill. The act provides that within five years after its passage each urban district containing ten thousand or more people shall prepare a plan for its improvement and extension. "This shall determine position of public squares, gardens, parks and open spaces; shall fix the width of roads; direct the manner of construction of houses; and in general shall establish the proper development of the towns on hygienic and artistic lines."

Each plan must be approved by the Department Bureau of Hygiene and by the Commission on the Preservation of Sites and Places of Natural Beauty and Historic Interest. The plan must also be subject for a year to public criticism before its adoption. Once finally approved, it is to remain in operation for thirty years when it is to be renewed or modified. During all this time extension and improvement must be made in accordance with it.

### "BARKING FOR A LIVING"

The phrase "barking for a living" in this country conjures up a picture of the man in front of the circus side show who invites the public to see the "Wild Man of Borneo" and the other marvels of the world. But Paris has a company of barkers of a more literal kind. To qualify one must be able to imitate perfectly every variety of canine yelp. Candidates for the post of "dog-revealer" must submit to a rigorous test. They are tried literally on the official dog. If they satisfy that discriminating animal they are appointed at an initial salary of \$30 a month.

The duties are simple. Each night the "dog revealer" barks for five minutes outside of every house on a pre-arranged beat. If the dwelling contains a dog it replies with enthusiasm and the "dog-revealer" takes down the street number. On the following day the license office examines the records to see if the house owner has paid a dog tax. If he has not an action is brought against him.

### PEOPLE'S CLUB HOUSES FOR MINNEAPOLIS

The last annual message of James C. Haynes, mayor of Minneapolis, shows how widespread throughout the country is the movement for social activities, administered by local governments. The mayor's program calls, among other things, for the appointment of a commission to investigate and report on the feasibility of a municipal fuel-gas plant, and for the taking over by the municipality of the lighting companies and applying the profits accruing from their plants to the construction and maintenance of People's Club Houses, which should furnish throughout the winter such social recreation as do the parks and playgrounds in summer. Such public center would in his opinion go far toward reducing vice and crime.

## WHEN SOCIAL WORKER MEETS HEALTH OFFICER

JOHN IHLDER

To social workers perhaps the most interesting thing about last month's annual meeting of the American Public Health Association, held at Washington, D. C., was the program and point of attack of the new sociological committee. Those who found their chief interest in this quarter moreover escaped from what many called an overcrowded program, for the sociological section alone had limited the number of formal papers so that there might be ample opportunity for discussion. And of this opportunity full advantage was taken. In the general sessions especially was the program overcrowded. On Friday evening, for example, there were the election of members, reports from the executive committee, from the advisory council and from each of the five sections, the election of officers, miscellaneous business, and then the presentation and discussion of eleven formal papers. Some of the discussions were vigorous, but people who stayed to the close became weary.

The chairman of the sociological committee, John M. Glenn, who is director of the Russell Sage Foundation, brought out in his report the close interrelation between social work and the older branches of the association. He said:

"The purpose of this section is to increase the social worker's knowledge of health problems and his interest in them; to bring social worker and health officer into closer touch with each other with a view to securing closer and larger co-operation between them; to bring to both a clearer recognition of the fundamental relation between social and health problems; and thus to develop the potential power of both to win and hold the interest and support of the public."

The report then defined the functions of social worker and health officer, and showed how intimately these functions bring the two together in their common desire to conquer the twin evils, poverty and disease. If such contact results in co-operation both will be strengthened; the health officer has legal authority which may be of great value when exercised in aid of social betterment, the social worker has opportunities to reenforce the health officer by securing for

him public sympathy and support, needed legislation, adequate appropriations and a larger staff.

This relationship was discussed further from the social workers' point of view by Homer Folks, secretary of the New York State Charities Aid Association, who declared that the social worker, if he is to preserve his mental and moral integrity, must be interested in the prevention of poverty and that the health officer, in seeking to prevent disease, is doing exactly the same thing, though he designates it by a different phrase.

From the health officer's point of view the subject was presented by Dr. W. F. Snow, secretary of the California State Board of Health, who laid a little more stress upon the aid which the health officer can give the social worker. Dr. Snow instanced a case in which the California State Board of Health, by officially endorsing a certain campaign of education undertaken by a social agency, had contributed very greatly to its success. He found fault, however, with the methods of social workers who disregard the health officer. Such a worker, on finding bad conditions, instead of going to the health officer for co-operation, or without knowing that the health officer lacks power or equipment to deal with the evils in question, gives publicity to his discoveries and to his demand that the health department cure the evils forthwith. This naturally prevents co-operation.

Dr. Snow's accusation brought an answer from Philip Jacobs of the Association for the Study and Prevention of Tuberculosis, who said that he is constantly receiving complaints from local workers who find that municipal health officers refuse to co-operate with them. This started one of the liveliest discussions of the conference, the health officers claiming that there are among the social workers a proportion of "office fussers," to quote one of the speakers, who are trouble makers, while the social workers dwelt upon the tendency, especially in cities where social work is comparatively new, of health officers to resent any suggestions from those who have no official position. Dr. Woods of Indianapolis described as a hopeful sign the increasing attention given to sociological work in the medical schools, but other speakers thought that even more encouraging is the fact that in cities where social work has become firmly established and where social workers and health officials have consequently been brought into long and close contact there has already developed a co-operation which is bringing about the results desired. It is chiefly in those parts of the country where the social workers are now breaking ground that the problem is still serious, and

such discussions as this where each side has opportunity to present its point of view must hasten the time, it was argued, when co-operation will be general.

Another aspect of the large problem of co-operation was touched upon by Selskar M. Gunn of the Massachusetts Institute of Technology. In urging closer team work between the public health and police authorities, Mr. Gunn argued that since there are few sanitary inspectors, each with a large district, and many police officers, each with a small district, the police should be used to inspect daily the cleanliness of out premises. When there is question, the matter should be referred to the health department. This, he believes, would not interfere with inspection as carried on at present. The opinion of police authorities secured in various parts of the country differed as to the feasibility of the plan.

At the other session of the sociological section, Dr. George Thomas Palmer, superintendent of the health department of Springfield, Ill., spoke on the Diagnosis of a Sick City, and Wickliffe Rose, secretary of the Rockefeller Sanitary Commission, described rural sanitary surveys in the South. Both speakers confined themselves closely to the investigation of existing evil conditions and the education of the community as to the significance of those conditions. The discussion turned upon the necessity for making a constructive program an integral part of a survey. In both cases inadequate toilet facilities had been found to be the most important evil. In the case of the city the constructive program could easily be formulated, as experience with similar conditions in other cities has led to the enunciation of the well defined policy—abolish all privies and install indoor, sewer connected water-closets. In the case of the country, no policy has been clearly stated. Mr. Rose's paper, which dealt chiefly with the close relation between hook worm disease and lack of sanitary toilets, contained no suggestion for the future except the use of that hitherto undiscovered thing, a sanitary privy. The best now in use is the L. R. S. barrel privy which the commission rates at 100, solely, it must be remembered, on the score that it does not appreciably pollute the soil. Next in order is the water-tight, fly-proof bucket privy which is rated at 75. From this the various types are listed down to "no privy at all," a very common occurrence, which is listed at 0.

One of the delegates from Porto Rico led the discussion of Mr. Rose's paper, describing the success which has attended the hook worm fight on the island, but he admitted that there has been no constructive policy designed to safeguard against a recurrence of the trouble, giving only his personal opinion that the owners of plantations should be induced to build latrines and compel their peons to use these structures so that the soil may not again become polluted.

The hookworm disease appeared constantly in the discussions of the conference and added interest was given it by the presence of two boy sufferers from North Carolina, one almost cured,

the other now in a most serious condition. These exhibits were enough to convince any sceptical northern delegates of the seriousness of this malady and of the tremendous importance of the work being done in the South to wipe it out.

Dr. C. E. Terry surprised many of the northern delegates by declaring that the Negro race is not increasing in southern cities. It has long been known that the Negro does not hold his own in northern cities. Dr. Terry's figures, based on investigations in Jacksonville, Fla., tend to show that not only is the Negro death rate large, but that it is larger than the birth rate, due mainly to unsanitary living conditions. These conclusions are corroborated by investigations made by Dr. E. C. Levy in Richmond, and by the National Housing Association, which has found an unusually small proportion of children among southern urban Negroes. According to Dr. Levy this condition is not confined to city Negroes but obtains also among those in the country districts about Richmond.

At a time when the high prices of food are a matter of almost universal concern, the argument advanced by Prof. William T. Sedgwick of the Massachusetts Institute of Technology, for less "fussiness" may obtain a more respectful hearing than it would under other circumstances, though the lack of enthusiasm in the audience which heard him did not promise immediate concurrence. Professor Sedgwick recalled the distressful times in Ireland at the time of the Irish famine and intimated that we of bountiful America may some day have a like experience if we do not stop throwing away good food. By this he did not refer to the overuse of the garbage pail, but to the strict enforcement of our pure food laws. "Suppose there are blood rings in the egg, what is the harm?" he asked. "An egg may have a spot and yet the greater part of it be wholesome food. Use a little common sense and use them for food. If your oysters are polluted, cook them and use them for food: if the milk is a little low in standard, cook it and use it for food; and if there is a little tuberculosis in beef cattle, use parts which are not affected."

#### SUNDAY, OCTOBER 27

Sunday, October 27, is being given almost a greater social burden this year than it can stand. Not only has the National Association for the Prevention of Tuberculosis designated it as tuberculosis day, but the American Prison Association, following an established custom, has chosen it as Prison Sunday. One hundred thousand churches and religious societies have been asked to observe it in the interests of tuberculosis prevention, and boards of charities, prison associations and other bodies in all the states are seeking to make prison reform the chief topic of conversation on that day. Many people are asking whether either cause will get the aid which it deserves. In the long run the conflict may prove beneficial, for a movement has already been started among various organizations, including these two, to make a schedule which will prevent such a possibility in the future.

## WHAT IS THE MINIMUM WAGE?

ARTHUR N. HOLCOMBE

CHAIRMAN SPECIAL COMMITTEE ON MINIMUM WAGE BOARDS, NATIONAL CONSUMERS' LEAGUE;  
INSTRUCTOR IN GOVERNMENT, HARVARD UNIVERSITY

The time is ripe for a statement regarding the minimum wage. No plea is wanted, but an explanation and a discussion of the part it should play in the program of the social reformer. The enactment of a minimum wage law in Massachusetts, the adoption of a constitutional amendment authorizing the enactment of minimum wage legislation in Ohio, the endorsement of "minimum wage standards for working women" by a great political party, all within the last six months, indicate that the minimum wage has been brought down out of the realm of the "ideologists" and become a tangible proposition for practical Americans.

Readers of *THE SURVEY* do not need to hear an argument for the minimum wage. Since the International Conference of Consumers' Leagues unanimously recommended it to its members four years ago, the advocates of the minimum wage have actively urged their cause in this country. The most convincing and at the same time the most accessible pleas for the minimum wage are the two reports by Mrs. Florence Kelley for the Committee on Standards of Living and Labor to the National Conference of Charities and Correction of 1911 and 1912.<sup>1</sup>

The Massachusetts act of 1912 is a typical minimum wage law. It instructs the governor to appoint a commission of three persons, and authorizes this commission to establish minimum wage boards for the determination of the wages of women and minors in any occupation in which the commission has reason to believe that the wages paid to a substantial number of the employees are inadequate to supply the cost of living and to maintain the worker in health. A board will be established by the election of an equal number of representatives by the employers and employees respectively, in an underpaid occupation, and by the appointment by the commission of a smaller number of representatives of the general public; or the commission may appoint the representatives of all parties concerned. It should be observed that the law contemplates the establishment of minimum wage standards above the amount required for the bare cost of subsistence. "To maintain the worker in health" means to provide him or her with the means of a

wholesome and sane livelihood, to enable him or her to lead the life of an active, intelligent, free American. In short, the object of the minimum wage is not merely to maintain life in individual workers but to maintain the American standard of living in the working classes. The Massachusetts law, it is true, applies only to women and minors; but the Ohio constitutional amendment authorizes the enactment of legislation for men as well as for women and minors.

The Massachusetts law is frankly an experiment. Its operation must be judged in the light of the purpose underlying it. The term "minimum wage board" suggests the minimum wage boards which have been in use in certain Australian states for nearly a score of years, but the purpose of the Australian and American boards is not the same. The Massachusetts boards are to be constituted in much the same way as the Australian, and their procedure should be much the same. The Australian boards, however, are authorized to fix the wages for adult men as well as for women and minors and for skilled, well paid workers as well as for unskilled underpaid workers. The Australian boards in practice have greatly diminished the evil of sweating, that is, of persistent systematic underpayment of unskilled labor. They have also served as potent instrumentalities for industrial peace for all grades of labor. The boards contemplated by the Massachusetts act of 1912 are not intended to deal with the problem of industrial peace except in so far as that problem is affected by sweating. They are intended to deal with the sweating problem alone.

The Massachusetts law, moreover, does not give to the commission the power to forbid the payment of less than the minimum rates fixed by the wage boards. If two-thirds of the members of a board agree upon a schedule of minimum rates, the commission is authorized to notify all employers and employees concerned and, thereafter, if the employer fails to pay at least the rates fixed by the board, the commission may give public notice of such delinquency by advertisement in the local press. Public opinion is thus relied upon to provide the necessary sanction for the observance of the minimum rate schedules. The Ohio constitutional amendment gives the legislature unrestricted power to estab-

<sup>1</sup>Reprints of these may be obtained from the National Consumers' League, 105 East 22d Street, New York.

lish and enforce a minimum wage. Clearly the people of Ohio are willing to see the principle of the minimum wage applied to men as well as to women, and enforced by such means as may in the judgment of the legislature be necessary. This grant of power makes it possible to apply the principle of legal protection to the standard of living in a more logical manner than has been done in Massachusetts. So long as the unit of society is the family, the standard of living can not be effectively protected unless a minimum wage can be determined for all its members. The Massachusetts law should put a stop to the worst forms of exploitation of female labor, but it can not effectively protect the standard of living so long as the supply of male labor is uncontrolled. The people of Ohio have voted for a thorough and consistent policy for the protection of the standard of living.

The minimum wage is a measure of social reform which can not stand alone. It must be supported as an indispensable plank in a broad platform. The state which undertakes to set up minimum standards of remuneration for normal workers is substantially undertaking to guarantee the wage-earner from poverty resulting from the special cause of underpayment. If this attempt is to be made under the most promising conditions, it must be made as part of a general effort to combat poverty by striking its causes at their roots. The minimum wage must go hand in hand with insurance against accident, sickness, old age and unemployment. Furthermore, the state which undertakes to set up minimum standards of remuneration must also undertake to set up minimum standards of efficiency. The minimum wage must therefore also go hand in hand with better industrial training and vocational guidance.

It is not the purpose of the present article to set forth in any systematic way the case in favor of the minimum wage. But it is desirable to consider briefly the arguments commonly advanced against it.

These arguments are of five sorts. First, the opponent of the minimum wage may object that there is no need for additional legislation to prevent underpayment. Readers of *THE SURVEY* know that more drastic action of some sort to prevent the exploitation of unskilled and low paid workers is necessary. Uninformed persons, however, will often deny the existence of any considerable amount of underpayment in this country. The only effective reply to such persons is to point to the facts. These facts may be most copiously found in recent reports of the Federal Immigration Commission and of the Federal Bureau of Labor. Particularly, the immigration commission report on immigrants in cities and the bureau of labor report on Women in Industry are most illuminating sources of

information. These reports, unfortunately, are not easily accessible to all. Interested persons can find this information conveniently summarized in Scott Nearing's book on Wages in America. A thorough discussion of the question, What ought the American wage-worker to earn in order to live in decency, as distinct from the question, What does he earn, may be found in Mr. Streightoff's book on the standard of living among the American working classes.<sup>1</sup> I have put together the most significant evidence on this subject in an article on the minimum wage in the *American Economic Review* for March, 1912.

Secondly, there is the objection that the establishment of minimum standards of remuneration by authority of law is inexpedient. Those persons who make this objection are not necessarily either ignorant or heartless. They may be simply the victims of a false theory. Persons who have been trained in the evolutionary philosophy are apt to assert that wage-workers tend to receive what they are worth, that to pay the least efficient workers more than they are worth will encourage inefficiency, that if the competitive system is permitted to operate undisturbed, the least efficient workers will be eliminated by natural causes and thus in the long run the prosperity of the working class as a whole will be best promoted. Such stated rather baldly is the argument of the *laissez faire* doctrinaire. Those who advance this argument today are guilty of assumptions that are contrary to fact. It is not true that unskilled and low paid workers today necessarily get what they are worth. Some underpaid workers are the victims of brutal employers. Others are the victims of social and industrial conditions wholly or largely beyond their control. The evidence of these statements may be found in the report of the Massachusetts Minimum Wage Commission to the legislature of 1912. Individual action, even voluntary collective action, as through trade unions, has proved utterly incapable of dealing with brutal employers or with the stubborn facts of social and industrial environment. Nothing short of public legal action will meet the necessities of the case.

Thirdly, it may be objected that the plan of fixing minimum wage standards by special boards is impracticable. We can only reply that we believe the contrary, and in support of our belief, we appeal to the success of such boards in England and Australia. The earlier history of the Australian boards is well described by Victor S. Clark in his book, *The Labor Movement in Australia*. Since the publication of Mr. Clark's book

<sup>1</sup>Standard of Living among the Industrial People of America, Frank H. Streightoff, Houghton Mifflin Co. 1911.

six years ago, the system of minimum wage boards in Australia has been greatly extended. It was the good results obtained in Australia that induced the British Parliament three years ago to provide for the establishment of minimum wage boards in Great Britain. The results of the British legislation are clearly and fully described in an article by E. F. Wise in the *American Economic Review* for March, 1912. The experience of Australia and Great Britain affords ample ground for the belief that the machinery for the establishment of minimum wage standards will work in America.

Fourthly, it may be objected that certain alleged pernicious consequences will more than outweigh any possible benefits. For example, it is sometimes asserted that the establishment of minimum wages for low paid workers will inevitably lead to the reduction of wages of high paid workers. This assertion is fallacious. The price of skilled labor depends on the supply of such labor and its value to the industry. The supply of such labor will not be increased nor will its value to the industry be decreased by the fixing of minimum standards of remuneration for unskilled labor. Again it is asserted that the fixing of minimum standards of remuneration will throw the least skilled workers out of employment. In so far as underpayment is the result of the inability of the worker to secure the true value of his services by individual bargaining, this assertion is not true. Some workers, however, are not worth a minimum standard of living wage. This unfortunate class exists anyhow whether the minimum wage is provided for or not and the establishment of the minimum wage will make it easier to deal with this class more effectively than heretofore, either by the extension of industrial education and vocational training or otherwise. Instead of discouraging the minimum wage will tend to encourage efficiency.

Again, the opponents of minimum wage legislation assert that there are industries which cannot afford to pay standard of living wages. The only answer to this argument is that if there be such pauperizing industries, the country would be better off without them. However, no evidence that such industries actually exist in the United States has yet been made public. Another form of this argument is that the industries of a given state cannot bear the establishment of minimum wages until minimum wages are established in similar industries in other states. This argument, however, is advanced against every proposal for labor legislation and requires no special consideration in connection with the minimum wage.

Lastly, when all other arguments fail, the advocate of minimum wage legislation is told

that his proposal is unconstitutional. This argument evades the merits of the question. It is obviously not intended to convince the reformer of the un wisdom of his proposal but to discourage him from attempting to put his proposal into effect. The advocate of the minimum wage, however, will not be thus easily discouraged. He will remember that the eight-hour law for women was once held unconstitutional, but that the judicial mind eventually yielded to the compelling arguments of the Brandeis brief. The constitution does not forbid the establishment of the minimum wage by law. It forbids only unreasonable and arbitrary infringements of the individual's liberty of contract. If the minimum wage is not unreasonable and arbitrary, it need not be unconstitutional. Those who are familiar with Miss Goldmark's *Fatigue and Efficiency* know how the judicial mind can be convinced of the reasonableness of a legislative measure, even in the face of adverse precedents. Certainly the present Massachusetts law is not unconstitutional. If the Massachusetts law conferred mandatory powers as recommended by the original minimum wage commission instead of merely recommendatory powers, the law doubtless would still be constitutional. If a minimum wage law should be enacted applying to adult males as well as to females and minors, as authorized by the recent constitutional amendment in Ohio, the case would be somewhat more doubtful since the state constitution cannot authorize legislation in conflict with the federal constitution. Since the twentieth century definition of the police power by Justice Holmes in the *Oklahoma Bank Guarantee Law* case, the power of the state to protect its citizens even against such evils as underpayment is apparently secure. The advocate of minimum wage legislation will not be discouraged by the alleged unconstitutionality of his proposal.

## HISTORY OF WOMEN IN INDUSTRY

ANNIE HOWES BARUS

"The story of woman's work in gainful employments is the story of constant changes or shiftings of work and workshop, accompanied by long hours, low wages, insanitary conditions, overwork, and the want, on the part of the woman, of training, skill and vital interest in her work." With these words Helen Sumner<sup>1</sup> summarizes her findings after a careful study of the conditions which brought woman into industry as a wage-earner, and has kept her there for over a century. An impartial reader of her historical evidence can but assent to this verdict, despite its severe arraignment of modern civilization.

<sup>1</sup>Report on Condition of Women and Child Wage-earners in United States, 10 vols., Vol. IX, History of women in industry in the United States, prepared, under the direction of Charles F. Neill, commissioner of labor, by Helen L. Sumner, Ph. D.

The establishment of government and state bureaus of labor and statistics within the past thirty years has put a mass of reliable data at the disposition of a student of present-day conditions. In consequence Miss Sumner wisely placed greater stress on the early years of factory and work-shop life as the material for this study of early conditions only became available within recent years, having been buried in rare old pamphlets and newspaper files.

The unpaid woman worker within the home with her distaff and spinning-wheel has from time immemorial been an important factor in production, though the character of her contribution to the economics of society has been frequently overlooked, probably because it received no remuneration. It is as a re-adjustment of industry rather than as an economic revolution that the unparalleled change in woman's labor since she has become an industrial wage-earner is presented in this study.

Omitting agricultural pursuits and the professions, the industries in which women have been at work are grouped into six classes. In four of these, viz., the manufacture of textiles, the clothing and sewing trades, domestic service and the preparation of foods, women are shown to have continued their traditional occupations.

With the introduction of machinery they were compelled by the pressure of want and necessity, despite popular prejudice against women working outside the home limits, to follow their trades into the mills. At the outset they held almost entire possession of the textile industry. Later the division and subdivision of labor made possible by improved machinery, the incoming of immigrants, the practical shutting down of many cotton mills during the Civil War and the consequent dispersal of their skilled women weavers completely changed the ratio of men and women operatives in the cotton mills until today women number less than fifty per cent. And the percentage is constantly decreasing as the requirement that one hand shall tend an increasing number of machines makes the weaver's task too severe for women.

The gradual loss of opportunities in the textile factories led to women seeking employment elsewhere, and without training they could only secure unskilled positions. As unskilled workers they entered the printing shop, the book binderies, the paper manufactories, etc. They forced their way as strike-breakers into the tobacco industries and a certain natural deftness of hand has kept them there in considerable numbers.

Into the needle trades early in the past century drifted a large number of dependent women whose legitimate employment as "spinsters" had been taken from them by the displacement of the home by the factory products. The pressure brought to bear by competition in this trade presents one of the most pathetic phases of the sacrifice of woman's vitality in the long period of labor re-adjustment. The average pay of a worker in a textile factory from 1833 to 1850 seems to have been about \$2 a week plus board. The latter was estimated from \$1.25 to \$1.50 a week. This wage of \$3.50 made it difficult for

households in the neighborhood of mills to retain their servants, as the pay for domestic service, which had gradually risen from 50 to 70 cents a week in the early days of mill opening, had not kept pace with the rise of wages in the factories, and was but about \$1.50 in 1850.

A study of the wages paid in the sewing trades at about the same time made by Matthew Carey, the champion of the underpaid seamstress, gives the following estimate of receipts and expenditures. It is valuable for comparison with similar studies of working women's budgets today:

44 weeks' work at \$1.25....	\$55.00
Lodgings, 50 cents a week, per year .....	\$26.00
Fuel, 25 cents per week (but say 12½) .....	6.50
	<hr/> 32.50
Amount left for victuals, clothes, etc., per year.....	\$22.50

A committee of ladies "of respectability, intelligence, and competence to decide the subject" whose names were suppressed "from motives of delicacy" stated he had overestimated the number of shirts a seamstress could make in a week as well as the average rate of pay. A new compilation based on their figures gave but six cents a day as available for food, clothing, and other necessities. "It may excite wonder," he said, "how seamstresses, spoolers, etc., are able to support human nature as their rent absorbs about two-fifths of their miserable earnings. The fact is they generally contrive to raise their rent by begging from benevolent citizens."

It is interesting to find as early as 1845 an appeal to consumers in the *New York Tribune* to use their purchasing power to secure openings for the employment of women in dry-goods shops as salesgirls and relieve the pressure of competition in the clothing trade. The same method was urged that the Consumers' League now uses to protect girls from the bad working conditions in department stores. "Our women of intelligence and means," suggests the *Tribune*, "should take compassion on their less fortunate sisters and for their sake refuse to trade where they cannot be waited on by females."

It was assumed that when women replaced men in the shops they would receive the same pay for similar work, no account being taken of the fact that, as Miss Sumner puts it, "when women replace men the standard of wages in the occupation tends to be reduced to the level of women's wages in other occupations."

The increase in the employment of women in the past decade in the trade and transportation group of industries forms one of the most salient features in modern industrial history. Such employment calls for a better education and more training than is needed for unskilled work in factories and work-shops. There has been so eager a response to the openings on the part of native-born women and girls that the payroll, except for specially gifted workers, does not show a much higher average of wages than women

secure in the manufacturing industries. The social prestige of such positions seems in part to offset this low wage in the minds of the workers.

That phenomenal publication, *The Lowell Offering*, the one picturesque episode in cotton-mill history, which fixed upon the coterie of Lowell mill girls the attention not only of the literary world but of students of economics, seemed to make possible the dream of such a wholesome inter-play of life and labor that the working life might blossom into poetry and fiction. Miss Sumner's narrative of mill conditions at that period makes *The Offering* appear still more extraordinary.

With a twelve to thirteen hour labor day; a system of blacklisting that would not be tolerated in any mill community at present; a "paternalistic" supervision that insisted on church attendance, but did not pay the pew rent and which in some cases even forbade dancing; with ill-ventilated and overcrowded sleeping quarters in the company's boarding houses, the splendid resiliency of the spirit of these mill girls gives one cause for wonderment and, incidentally, throws a side light on what must have been the dreariness of their farm homes, since the tonic of companionship, even under such wretched conditions, stimulated their imaginations.

"We are confined," writes Harriet Farley, in an editorial in *The Offering*, "but a life of seclusion is the lot of most New England females. We have but few amusements, but 'all work and no play' is the motto of this section of the Union. We breathe the close atmosphere, but ventilation is not generally better attended to elsewhere than in the mills. We are better and more regularly paid than most other female operatives. Our factory life is not often our all of life." This latter assertion may refer to the fact that a number of these mill operatives were accustomed to return to their respective villages and teach school for a portion of the year at one time.

The cotton-mill history is an index of the migration of unskilled labor into the country. The period of American operatives ended before the middle of the century; the Irish who replaced them were in their turn largely replaced by the French Canadians who came into the states shortly after the close of the Civil War, while within the past decade the southern and southeastern races of Europe have been crowding out the Canadians.

Athwart the black shadows cast by the conditions under which women have been exploited for this long period of time can be seen some glints of hope for future betterment in the fact that legislation has reduced the hours of labor; that the social conscience is gradually awakening to a realization that the hardships formerly tolerated as economic necessities may be lightened by such further legislation as a minimum wage, and that the abilities and aptitudes of the individual will be better gauged and trained for industry in youth when the public school system is re-adjusted as a vital part of an industrial democracy. The recent rapid growth of the idea of the value of trade unions for women

workers must be counted as a factor in securing better wages in the future. The gradual withdrawal of the sweated trades out of the homes by factory competition as well as by legislation, and the probable recognition as woman gains wider political influence of her right to equal pay for equal work in positions connected with the state and government are tendencies making toward the acceptance of the justice of her claim to a living wage.

Whether these ameliorations in the lot of the average working woman will make it possible for her to have an interest in her work if it remains of the monotonous character which division and subdivision of labor have made imperative, and which bears no relation to her hopes of future marriage and family life, is somewhat questionable. It may be that before the lapse of another century some re-adjustment of industrial conditions will make it possible to meet the drudgery of life by the method said to be suggested by the late Prof. William James of drafting into the industrial army of the world for brief periods of discipline and social service the youth of the country.

The careful survey Miss Sumner has made of the field of woman's industry outside the home will undoubtedly be of permanent value in helping to interpret and forecast future developments in such labor.

## THE EIGHT-HOUR LAW

JOHN A. FITCH

One of the most important labor bills passed at the last session of Congress was the eight-hour law applying to government contracts. This law provides that in all future contracts involving the employment of labor, to which the United States, the District of Columbia or any territory may be a party, there shall be a clause stipulating that the hours of labor shall not be in excess of eight per day. There are a number of exceptions to this general provision; the most important having reference to contracts for transportation by land or water, the transmission of intelligence, the purchase of supplies and the construction or repair of levees or revetments on navigable waters.

What effect this law will actually have on industry remains to be seen. If rigidly enforced, it will of course go much further in its application than to government contracts. A plant working on government orders could not very well meet the requirements of the law with respect to those particular orders without applying the eight-hour day also when working on private contracts. It would also be difficult for a plant to be divided, one part of it working on government contracts under the eight-hour day and the other part on private contracts on a longer day. There have already been suggestions that the law is unconstitutional and it will undoubtedly go to the courts for a decision before it has been in effect long. It may be, too, that the law will be nullified in some of its important provisions on account of a certain looseness in the wording of the part providing for exceptions, especially

that part declaring that it shall not apply to the purchase of supplies or of such materials as may usually be bought in open market. In specific terms, however, the purchase of armor plate is included in the law, and this will have a far-reaching effect upon those steel mills now providing armor plate for the government.

This bill, as a matter of course, aroused the opposition of manufacturers during the period prior to its passage and it is still being discussed in a hostile spirit by some of the leading trade papers, especially those devoted to the iron and steel trade. The *Iron Trade Review* of July 4 declared, in an editorial discussing wages and prices, in which it was claimed that wages have been constantly advancing while prices of steel have either remained stationary or declined, that "the suggestion that the twelve-hour day give place to a three-shift system is particularly out of place at this time." In an editorial in the *Iron Age* of June 27 the statement is made that "the eight-hour day will come when our economic conditions favor it, but never by force, even though it takes the semblance of law."

In view of these statements consideration may well be given to conditions in the steel industry at the present time. Ever since the publication in the *Iron Trade Review* of the editorial referred to above, prices of steel have gone steadily up and they are still rising. There has not been an issue of either of these important trade papers since the first discussion of the eight-hour law that has not described the booming prosperity of the steel mills. By the middle of September orders for 1912 delivery were no longer being accepted and only last week it was reported from Pittsburgh that "many manufacturers in this district already have booked sufficient tonnage to necessitate mills operating at capacity well into the second quarter" [of next year].

The *Iron Trade Review* tells us that the demand for labor in order to get out the piled-up orders has grown so keen that the missions and rescue stations of the great cities are being called upon to assist in meeting the heavy demand for labor by furnishing a large quota of reformed down-and-outers.

In connection with the eight-hour movement it is interesting to observe what has happened in another country. In 1907 John Hodge, secretary of the British Steel Smelters' Union, proposed to the steel manufacturers of South Wales that they should adopt an eight-hour day in their open-hearth furnaces. After considerable discussion and after one company had made a trial of the plan for a year, the Employers' Association of South Wales agreed to this proposal. Confronted then, as they were, with the practical difficulty of getting men in case all of the steel companies adopted the eight-hour day at once, it was decided to leave the working out of the plan entirely in the hands of John Hodge, all decisions with regard to the time of adopting the plan to be left to him. As a result of this agreement, Hodge designated the time when each company in turn was to go to the eight-hour day.

The first mill went on eight hours in 1907. The last mill in South Wales to adopt the eight-hour day went on that schedule June 17, 1912. By this gradual process the industry was not disturbed by any sudden and violent change. So satisfactorily was the whole matter worked out that recently an official of the Employers' Association of South Wales testified before a government commission that they would not think of being without the union. There may be a suggestion for American manufacturers in this little incident in collective bargaining in another country.

### THE FURRIERS' STRIKE

On September 8 a settlement was reached in the strike which the furriers of Greater New York had been maintaining since June 20. New York is the largest fur-manufacturing city in the world. There are 800 shops and 10,000 workmen, skilled and unskilled.

A few of the skilled men, numbering about 300—all of them German immigrants—have had a union for a number of years known as the Furriers' Union of New York and Vicinity. It is a conservative union devoted to the interests of skilled men alone, maintaining different sorts of benefits, but it had utterly failed to bring about any important improvements in conditions in the trade.

Five years ago an attempt was made to organize the whole industry into a union. Some success was attained in organization, but in a strike which was called the men lost and the union was disrupted. A few have maintained the organization and last winter, beginning in December, 1911, it renewed its activity and the men began to join in large numbers until finally it had a membership of over 6,000. This organization is known as the Furriers' Union of Greater New York.

During the strike just closed there were a number of serious grievances against which the men felt they had a right to protest. In many ways, the most important was the lack of regulation with regard to overtime work. The men had a nominal working day of nine hours with a six-day week, but the custom was to require them to work seven days a week with many hours overtime each day during the heavy season which extends from September to January. Overtime in varying amounts was paid, but it did not prove sufficiently burdensome to discourage the practice of requiring overtime work. The effect of the long hours was further accentuated by the fact that the industry is a dangerous one because of the liability to occupational disease.

Another grievance was with regard to wages paid. As many as three separate scales were paid the same men each year. A skilled worker would get about \$12 a week in January, \$20 a week in May and during the heavy season from September to the end of the year, he would get as much as \$30.

The settlement which ended the strike did not definitely settle all of these grievances, but it did provide the machinery for settling them and opened the way for future adjustments. The

employers did not entirely recede from their claim that during the rush season the men should be employed every day in the week, but they did agree to a forty-nine hour week with the payment of time and a half for all overtime and to a half holiday on Saturday, not to be encroached upon even in the rush season. No definite scale of wages was agreed upon, but it was provided that there should be two price adjustments each year instead of three.

Further than this, the most important terms of the settlement were with regard to sanitary conditions and the future settlement of grievances. It was provided that no work was hereafter to be taken to employes' homes and that equivalent conditions should prevail in all outside shops as in the inside shops. This is a very important provision, for some of the employers had been having only a small part of their work done at their places of business and the larger part in unsanitary tenements on the East Side. This rule will either clean up the tenement shops or drive the work into the factory of the owner. It was provided also that a joint board of sanitary control, similar to the one now operating in the cloak and suit industry, should be established. As to the settlement of further difficulties, a conference committee has been established consisting of eleven members, five representing the employers and five the workers, the chairman to be elected by them and representing the public. The choice of the committee for chairman has fallen upon Dr. J. L. Magnes of the Jewish Community.

The importance of this strike and its settlement lies in the fact that a hitherto unregulated industry, where conditions seriously affecting the health and welfare of the workers had previously been allowed to exist, is now to be subject to supervision not only of committees representing the workmen but of the interested public as well.

#### HOURS OF LABOR IN FRANCE

A recent consular report<sup>1</sup> contains a brief account from Consul General Mason, at Paris, regarding legislation regulating hours of labor in France. In 1848 a decree was issued establishing twelve hours as a maximum in manufactures and workshops. In 1892 a statute was enacted limiting hours for women and children. In 1900 a new law made eleven hours a maximum for establishments employing men on the same premises with women and minors. This law further provided that the maximum should be ten and one-half hours after 1902, and ten hours after 1904. In 1905 a law was passed applying to mining operations alone, limiting the day's work to nine hours, and providing that in 1907 the limit should be placed at eight and one-half hours, and that in 1909 it should be further reduced to eight hours.

It was found in practice that the strict enforcement of the general law of 1900 "entailed difficulties in the management of certain industries,"

so in 1902 a decree was issued that greatly impaired the effectiveness of the law. A list of exceptions were published allowing overtime from one-half hour to four hours in the case of certain industries, some continuous and some not, and in certain cases allowing overtime to an unlimited extent.

As to the enforcement of these laws the report very naively says:

"It is to be remembered that France is a republic; the working classes are independent citizens; they are for the most part industrious, frugal and zealous in all that relate to their earnings and income; and many resent any interference which by restricting their hours of labor must diminish their earnings.

"It results, therefore, that in certain classes of employment, particularly the manufacture of millinery, women's clothing, hats, etc., in which many thousands of skilled operatives and needlewomen are engaged in and about Paris, the laws limiting hours of daily labor are enforced with great leniency, in many cases not at all. The employe by working overtime in busy seasons earns the privilege of being retained when others are discharged during the seasons when trade is dull.

"Factories and machine shops which have important orders to fill within a prescribed period frequently obtain permission from the local inspector of labor to work their employes two, three or even four hours overtime, generally with the proviso that proportionate free time shall be given when the urgent work is completed and the stress is past.

"France realizes the extreme importance of enabling its manufacturing industries to maintain their highest standard of productivity, especially in all that relates to export trade or competition with the industries of other nations, and the labor laws are enforced in a spirit of benignant consideration for the material interests involved."

Discussing the effect of this legislation, the report states that labor cost has in some cases increased. Especially is this true where the machinery is driven by power "independent of the physical strength of the operative," where a reduction in hours means a decreased output. A further effect noted is that "the shortening of the labor day has been followed in French factories by a great increase in the system of piecework, under which operatives who formerly worked by the day of eleven or twelve hours now work by the piece, so that the work performed, not the time consumed, forms the basis of compensation. Moreover, the most intelligent employers find that the effective daily capacity of most employes, especially in occupations which require the exercise of manual skill or mental intelligence, is practically limited to ten hours. 'Better ten hours of good, earnest, intelligent work,' said the director of a great electrical manufacturing company, 'which leaves the workman time to take some recreation and care for his family, than weary, listless service after the physical energies have been exhausted.'"

<sup>1</sup>September 27, 1912.

## JOTTINGS

## PUBLICITY AND INDUSTRIAL DISPUTES

The New York Labor Bulletin for June contains an interesting account of how Commissioner Williams and the State Board of Arbitration brought an employer and his employees together and ended a strike. The cotton spinners at New York Mills went on strike last March their demands being higher wages, the abolishment of fines, the discharge of a disliked superintendent, and the improvement of the company houses.

Representatives of the Bureau of Arbitration made repeated attempts to induce the officials of the company to meet a committee of men to discuss grievances, all to no avail. Finally in April, Commissioner Williams served notice on the mill owners that unless they made announcement through the press of their willingness to meet their employees, and fixing a place and time for such a meeting, he would at once begin a public investigation of the strike. The company replied by publishing an announcement, in the press, on April 18, in which they agreed to meet their employees and named a place and date. On April 20 and 22 conferences were held, resulting in an adjustment satisfactory to the workers, including a 12 per cent advance in wages, the employment by the company of an interpreter to hear complaints, and the improvement of company houses.

This incident illustrates the power for social betterment possessed by the State Board of Arbitration when supported so vigorously by the commissioner.

## WORKMEN'S COMPENSATION

Three very useful publications on workmen's compensation have recently been issued. In Part I of the Thirteenth Biennial Report (1911-12) of the Bureau of Labor, Industries and Commerce of Minnesota, Don D. Lescohier and Arthur O. Garrison discuss important technical points, summarize the various forms of compensation law passed in the last two years, give the text of the recent court decisions in compensation, outline the principles underlying the different laws and give an elaborate table of all the compensation laws so far passed. This Minnesota report is even more inclusive than the excellent table prepared by *Human Engineering* a few months ago. The tabulation shows three compulsory and eight elective compensation laws, three compulsory and four elective insurance laws.

The July Bulletin of the Industrial Commission of Wisconsin contains, besides a full study of the first year under the state action, a comparative review of all the acts now in operation in the country. A supplement is devoted to the year's industrial accidents in Wisconsin.

Another handbook of American compensation laws has been lately prepared by the National

Association of Manufacturers in co-operation with the Manufacturers' Association of Connecticut which can be obtained from the National Association, 30 Church street, New York, for fifteen cents. This digest is arranged for subject reference under the matter covered by the various clauses of the state laws with marginal notes giving state and section of the law.

## OREGON INVESTIGATION OF WOMAN AND CHILD LABOR

The Consumers' League of Oregon will present to the Oregon Legislature in February, 1913, a bill for the creation of minimum wage boards for those industries which employ women and children. In order that the campaign may rest upon a well-grounded foundation of facts, the league is conducting a thorough survey into all conditions pertaining to the life of the working woman and child in the home and in the factory. The investigation is divided into the following heads: 1. standard and cost of living; 2. housing; 3. wages and hours; 4. sanitary conditions under which women and children work; 5. legislation concerning the four topics; 6. education and recreation in their relation to the efficiency of the workers.

The work is in the hands of experts and all sources are being drawn upon for information and help. The recreational survey is in charge of L. H. Weir, field secretary of the National Playground Association. Caroline Gleason, a graduate of the University of Minnesota, has charge of the industrial survey.

## MATERNITY INSURANCE IN ITALY

Italy joined in 1902 the few European states which have established laws for the better protection of women working in industrial occupations after confinement. This law prohibited women from working for a month after confinement, but contained no provisions about the collecting of funds from which the expenses could be defrayed. For this reason the regulations were generally disregarded, and women went back to work as soon as they were able to do so.

At the end of April of this year a new law came into force. All women in industries between fifteen and fifty years of age belong now to an obligatory maternity insurance fund. The employer pays the dues of twenty to forty cents a year, and is allowed to deduct half the amount from the wages. These dues, together with fines of employers for violation of the law and a government subsidy, make it possible to give in case of confinement or miscarriage \$8. It does not make any difference whether the woman is married or not. Mother and child are thus taken care of for at least one month after the birth of the infant. The Italian law requires, further, that a factory with more than fifty women workers must provide a decent room in which mothers can attend to their babies and nurse them. Frequently, large factories have a kind of day nursery with a trained nurse in charge. Infant mortality has been greatly reduced among industrial workers.

# CHURCH AND COMMUNITY

Edited by GRAHAM TAYLOR

GRAHAM TAYLOR

Warden of Chicago Commons, member of the faculty of the Chicago Theological Seminary, who will edit this department. Communications should be addressed to the western office of *THE SURVEY*, 116 Michigan Avenue, South, Chicago.

**U**NDER this title the action of religious bodies—Jewish, Roman Catholic and Protestant—which seem to have greatest social significance will be concisely reported and commented upon from month to month. \* \* \* Among many signs of better times coming is the growth of the common ground upon which church workers and social workers meet, mingle and exchange values.

That religion and society, the church and the community, have values to exchange becomes clearer in the consciousness of those working for each. Indeed, it becomes more and more evident that work truly done for one serves the other. Though not identical in aim or method the church and community cannot be separated.

\* \* \*

*If the community fails the church cannot succeed.*

*If the church fails the community is not successful.*

\* \* \*

Reciprocity is more and more sought by each. The church needs the social spirit and method of the best work for the community. And social work no less needs the spiritual ideals, sanctions and passion which religion only can give to any and every kind of service.

The common ground upon which this religious consciousness in social work and this social consciousness in religious work are being born anew is growing under the feet of those most actively and effectively at work for their fellowmen. The National Conference of Charities and Correction, with Roman Catholic, Jewish, Protestant, and Ethical Culture members equally interested and active, is a new kind of "Ecumenical Council," which broadens the ideal and scope of the service which the early church sought to render when it was one in all the world. Church assemblies and missionary conferences, congresses of social workers and gatherings of specialists vie with each other in laying both the religious and social emphasis upon the same aspect of human life.

In the process, work for the individual becomes no less indispensable but all the more effective, and work for the community becomes no less socialized for being more personal and human.

\* \* \*

It is being demonstrated to the church and community alike that while it is good to reform it is better to form; while it is good to dispossess wrongs it is better to pre-

*occupy and prepossess with the right. While sometimes it is necessary to be negative it is stronger to be positive and affirmative; while it is good to know and teach and legislate what not to do and what not to be, it is better to preach and practice what it is best to do and be; while destructive aims and methods are demanded, yet both church and community far more need constructive ideals and executive ability to realize them.*

\* \* \*

THE SURVEY aims to be part of this common ground on Mother Earth upon which workers in the church and community, working for distinctively religious or social ends (if indeed they are to be distinguished) meet and mingle for mutual interpretation and co-operation in serving the common human cause.

Its contributors bring to its columns information about the social work of the churches and synagogues such as does not fail to interest and inspire social workers. They bring the record and challenge of social achievements which are new and suggestive to church workers. These contributions find place in Trend, in Common Welfare paragraphs, in editorial comments, and contributed articles. They will continue to be scattered through our general pages.

But in this new department, THE SURVEY will be able to give more consecutive and inclusive service than heretofore. Editors and readers will alike be largely indebted for material to the executive officers of the various denominational social service boards, and other agencies fulfilling the same function. Items of news bearing on church and community experience are sought from all those who in each religious fellowship are actively at work on the common ground where "religion in action" trenches upon the field of THE SURVEY.

\* \* \*

Communications should be addressed to the editor of this department, Prof. Graham Taylor, at the Chicago office of THE SURVEY, 116 Michigan Avenue, South, Chicago.

#### FEDERATION FOR SOCIAL ACTION

The growing co-operation of Protestant churches is nowhere faced with greater or more practical opportunities than through the Commission on the Church and Social Service, through which the Federal Council of the Churches of Christ in America seeks to fulfil its social function.

This commission is now reinforced by a Secretarial Cabinet, consisting of the secretary of the commission and the eight secretaries of the denominational social agencies representing the Baptist, Congregational, Episcopal, Methodist and Presbyterian churches.

A series of social service handbooks is now in course of preparation. Among the helpful publications already produced by these co-workers are a brief bibliography for the study of social and industrial questions; a reading list outlining a course on social subjects for ministers and social workers; and a social service catechism. The commission has just brought out a very useful volume on the Social Creed of

the Churches.<sup>1</sup> In order to interpret each of the thirteen articles in the declaration of social faith adopted by the Federal Council in 1908, brief studies of these tenets are presented. These include the conditions demanding the declaration; what is being done or proposed to meet the demand by official or voluntary action, and what the churches may do in co-operation with these endeavors, or through their own initiative. This joint work by a group of twelve men has been so effectively collaborated by the editor, Harry F. Ward, as to present a unity and progress of thought unique in a symposium. The hard facts of working conditions bearing upon the character, development and destiny of men, women and children for whose interests the church stands, are combined with the urgency of Christian ideals and obligations to indicate the points and methods through which the church should apply its standards to life. References to accessible sources of information and lists of ques-

<sup>1</sup>Social Creed of the Churches, edited by Harry F. Ward. Eaton & Main.

tions leading out to the study of conditions in local communities enable the reader to put the manual to very practical use.

### VIEWS OF CATHOLIC SOCIETIES

A significant recent event in the rapidly developing social service of the Roman Catholic church was the eleventh national convention of the American Federation of Catholic societies held at Louisville the latter part of August.

Attended by many of the most distinguished prelates of the church and by hundreds of representatives of federated societies, representing twenty-six states, the District of Columbia, the Philippine Islands and Porto Rico, and solemnized by the highest ceremonials of the church, the convention, as reported in the September number of its bulletin, presents an impressive survey of the varied and vigorous social agencies of the American Catholic church. The movements receiving special emphasis were those against divorce; against indecency in the theater and theatricals; against immoral pictures, statues, post cards and books; against the white slave traffic; and, in every utterance and the work of every agency, against socialism.

Among constructive actions taken by the federation were resolutions appealing to all citizens to further the abolition of unnecessary labor on Sunday; urging the religious care and humane treatment of prisoners; exhorting all Catholics to labor for the peace of the world; and demanding a living wage, reasonable hours of labor, protection of life and limb, abolition of child labor, just compensation for injury, proper moral and sanitary conditions in the home, shop, mine and factory; sympathizing with organized effort and conservative trade unions; recommending co-operation with other institutions providing for the welfare of the more handicapped members of society, the immigrant, the colonist, the unorganized worker and the helpless; endorsing social study circles, lecture conferences, institutes for merchants and mechanics, and the study of co-operative movements, especially among foreigners.

The Social Service Commission of the federation, created last year by the convention held at Columbus, held its first general conference, with Bishop Muldoon in the chair. In speaking to the subject of social service, Michael Fanning, a West Virginia coal operator, urged co-operation with the Consumers' League and attributed most of the improvement in working conditions to organized labor. Professor James Haggerty of Ohio State University, estimated the unorganized workers' chances for organization and a living wage. The creation of public opinion for the promotion of social legislation was urged as a prime function of these federated societies by Peter J. McArdle, of Pittsburgh.

The bulletin of the federation, which is published monthly, gives a survey of Catholic social activities and contains a social service section edited by Rev. Peter E. Dietz, who with some Catholic trade unionists, organized two years ago The Militia of Christ. The stated purpose of this organization is to unite leading Catholic men and women in the crafts and professions and in social service to bring under the standard of religion the industrial relations, the interests of labor and capital, and particularly the labor unions.

The great federation of all Catholic societies and the organization of the National Conference of Catholic Charities and of this new industrial order, mark a new advance in social service in the American Catholic Church. So, too, does the use of parochial school buildings as neighborhood social centers in Chicago and elsewhere.

### LIGHTNING FROM THE TEMPLE

The lightnings which flashed from Sinai of old continue to strike out from the temple of the same name in Chicago. The following is part of a letter mailed to candidates for elective offices in the pending campaign:

To the Honorable—: Congregation—, one of the largest and oldest Jewish temples of this city, will give a bazaar and ball, the proceeds to be used toward our new temple. We herewith enclose tickets, feeling that your candidacy will be greatly benefited by your disposition thereof, as the attendance at this affair will be of such a cosmopolitan class of voters that cannot be reached by any other medium. Trusting that we may have the honor of your presence, and assuring you that our combined efforts will be used in supporting you at the coming election, and thanking you in advance for your favor in assisting this most noble cause,

Yours respectfully,

P. S.—It was unanimously voted that a list of all the names of those candidates that will make their remittance will be inserted in our souvenir program, also their names will be mentioned during the approaching holidays.

Dr. Emil G. Hirsch scorched this impiety in a recent issue of the *Reform Advocate* with such a stroke as Chicago has rarely, if ever, seen excelled, even in all the destructive and constructive work the rabbi of Sinai Temple has so valiantly done for a score or more of years:

"Sense of duty impels us to republish the above piece of literature, remarkable both for its style and grammar and for the cool effrontery of its demands. Silence in a case like this on our part might be construed too readily into approval of the damnable smartness which suggested to the writers the possibilities of their shrewd scheme. They have taken unpardonable liberties with the good name of Israel's religion. They have put in jeopardy the reputation for honesty and integrity of every voter of Jewish birth in this and every other community. They have committed a veritable *Hillul-ha-Shom*, an offense so grave that it is excluded from the list of

transgressions for which *Yom ha Kippurim* is said to bring remission.

"We are sure our feelings of shame and resentment at this outrageous hitching of peanut politics to questionable devices for raising revenue for religious institutions without the slightest consideration of the good name of Judaism and the good repute of Jewish citizenship, are shared by ninety-nine out of every hundred voters of Jewish origin in this city."

### JOTTINGS

#### METHODISTS AND SOCIAL SERVICE

The Methodist Federation for Social Service, since it was adopted as the official agency of the denomination, has been so fortunate as to secure the full time of Rev. Harry F. Ward as secretary. To his editorial service of the federation he thus adds all the executive functions of the new office, which is established at 2512 Park Place, Evanston, Ill. Two state secretaries have also been appointed, the Rev. E. Guy Talbott for California and the Rev. O. H. McGill for Washington.

Social service commissions are being appointed by the annual conferences to inquire concerning the extent of seven day work. An anthracite social service mission has been organized in Pennsylvania. Pittsburgh Methodist preachers have conducted a social service forum for the discussion of municipal affairs. One of the federation's men has been appointed assistant to Judge Lindsay in the juvenile court of Denver and another has entered the service of the Colorado Fuel and Iron Company's sociological department. Meetings under the joint auspices of local labor unions and Methodist ministerial associations are being successfully maintained at Elkhart, Muncie and Terre Haute, Ind. The basis of settlement that ended the corset makers' strike in Kalamazoo, Mich., was drawn up by the superintendent of the Kalamazoo district, who by request of the mayor acted as mediator.

All such local movements will gain information from the federation's publication and information bureau, inspiration from its suggestions for social evangelism, and initiative and constructive criticism from the "working plans" to be issued for the purpose of directing and testing the work of each local church.

#### UNION OF CHURCH AND CHARITY

A decided advance has been made at Buffalo, N. Y., in promoting the co-operation between the churches and the Charity Organization Society. While not yet ready to federate formally, the Protestant churches, practically all of which affiliated in the Men and Religion Forward Movement, have decided permanently to maintain common effort and to engage an executive secretary to represent and act in behalf of all of them.

The Charity Organization Society has also been moved to add a special church secretary to its staff, whose function it will be to promote and guide the co-operation of local churches with the district work of the society. Since 1885 the

city has been divided into 195 church districts, every church agreeing to care for neglected poverty in the district accepted by it, to that end supplying volunteer visitors and relief so far as it was able. The visitors and relief thus provided by the churches, however, have been placed under the direction of the Charity Organization Society. While every needy family is in the first instance referred to the church with which it has any connection, if it is still neglected the church which has assumed responsibility for the district undertakes to care for this still neglected family. The obvious advantages of this co-operation both to the churches and to the society have been somewhat offset by the difficulty of bringing the ready resource and the immediate need together and by the difficulty and delicacy in securing effective supervision. It is hoped that efficiency will be greatly increased both in administration and in the personal work accomplished by reducing the number of church districts to forty, which has already been done, and by the constant active co-operation of the two executive secretaries.

#### GIRLS' FRIENDLY SOCIETIES

The American Episcopal church renders no small part of its large social service in the co-operation it actively gives to the Girls' Friendly Society. The help extended this organization by the church is well exemplified in the conference of the society's social service associates held last month at the Vacation House at Huntington, Long Island.

The women who gathered there from eight states, representing thirteen dioceses, were leaders in some department of betterment work. The conference was devoted to a week's serious study less of methods than of the principles underlying the society's work. Courses of lectures on the social teachings of the prophets by the Rev. Ernest deF. Miel of Trinity Church, Hartford, and the social teachings of Jesus, by the Rev. J. Howard Melish of Holy Trinity, Brooklyn, emphasized the fact that industrial and economic problems, far from lying without the pale of religion are to be recognized as an essential part of the divine order of human society. Women in industry and the rural problem were the subjects of equally serious studies, led respectively by two women of large experience, Rosalie Phillips of Cincinnati and Anne Campion, fellow of the Bureau of Social Research in New York. The social service department of the Girls' Friendly Society is studying the prospect of establishing self-supporting houses for self-supporting girls.

#### SUMMER WORK FOR CHILDREN

Vacation Bible schools grow apace. In five years they have increased from 19 to 160; the children attending them from 5,000 to 38,000; the teachers from 70 to 700 and the cities maintaining them from 4 to 24. Over 700 college men and women engaged in their service last summer. The cost of the work was only one dollar for every child enrolled. The aim for 1915 is for 500 schools and 2,000 student helpers.

## MEN AND RELIGION MOVEMENT TO CIRCLE GLOBE

### FROM PERTH TO DURBAN

Route of the world tour which will carry the message and method of the Men and Religion Forward Movement into Shanghai, Jerusalem, Cape Town, and back to New York city.

In the belief that "present problems of the church are so intense that a real victory is possible only when all the forces are brought into action," an effort is going to be made in the first half of 1913 to carry the message and method of the Men and Religion Forward Movement around the world. Fred B. Smith, director of the movement, and Raymond Robins, the social service specialist, the story of whose thrilling rise from poverty and whose eloquent challenges to the church to make good in the Twentieth Century caught men's imagination's last winter, will be the chief standard-bearer in this "world gospel conquest." They will be accompanied by Harry N. Holmes of Wellington, New Zealand, as organizing secretary, and by the International Male Quartet—Gilbert, Metcalf, Keeler, Peck. The standardization of methods for making effective an aroused interest in social effort is one of the chief objects of the trip.

FRED B. SMITH

RAYMOND ROBINS

## SOME FIRST BOOKS OF THE CHURCHES' NEW SOCIAL CAMPAIGN

Wherever the churches are federating, they are undertaking, singly or unitedly, new campaigns in the local fields for social work. Next to a new comity between themselves, the greatest aim of the federated churches is to express

their common faith in terms of their common social ideals and relationships, and in united action to carry out these ideals and to realize these relationships both locally and in society at large. The first fruits of this movement of new life

in the federated churches happily took the form of a declaration of social faith, which is even more of a program for their industrial action. It was the initial utterance of their Federal Council's social service committee not only, but has been ratified by the largest denominations included in the thirty-five national religious bodies represented in the council which number no less than twenty million members. This declaration and program was followed quickly by the report of an attempt to apply these principles to the acute industrial situation at South Bethlehem, Pa., which seriously involved the local churches in the controversy between the steel workers and their employers over the right to one rest day out of the seven day working week.

Some of the first books of the new movement, written or edited by some of the men in the lead of this effort to federate the churches for social action, have already resulted in significant first acts. For instance, the two volumes of symposiums issued by the Methodist Federation for Social Service, under the titles, *The Socialized Church and Social Ministry*, led to the adoption of this voluntary society by the Methodist General Conference as an authorized agency of the denomination, with Rev. Harry F. Ward, editor of the latter volume, as the officially appointed secretary.

The latest of these attempts to give initial expression to the present phase of social faith is by Charles S. MacFarland,<sup>1</sup> secretary of the Federal Council of the Churches of Christ in America. In its aim it is typical of a group of recent publications, written to fulfil specific parts of a general purpose, so to interpret the social movement to the religious motive as to inspire its expression in social action. It is, as is each of the others, avowedly a first book. There is an unannounced but none the less manifest effort upon the part of every one of these writers to demonstrate, what Professor Rauschenbusch declares has become the fact, that to give social expression and application to Christianity is at last orthodox.

The "apologetic" trend just beneath the surface of all this literature clearly shows a sub-consciousness that the movement, however, is still under fire, and that these authors feel themselves to be still on the firing line. But their attitude is far more conciliatory than aggressive, more interpretative and mediating than defensive. They are, however, intent upon interpreting the social movement to religious people, so that it

becomes a part of their religious experience and work, rather than to interpret the bearings of religion upon social work and workers, which needs to be done just as much. Where this latter attempt is made it is incidental and in the form of very general, but not very effective, assertions of the ineffectiveness and evanescence of all human efforts without divine power, of all humanitarian agencies without personal regeneration.

To find common ground upon which to demonstrate the community of interests between religion and social progress is, as it should be, the primary purpose of these first essays to bring the two spheres together. Naturally, therefore, the religious experiences and passages of scripture most commonly identified with personal religion, are selected for social interpretation and application. Mr. MacFarland's appeal for social service, through many such passages and experiences, is that it is the incentive to, the condition of, and the expression for, spiritual culture.

Professor Batten,<sup>2</sup> who has just been chosen to be the social service secretary of the Northern Baptist Convention and the American Baptist Publication Society, writes as if he were conscious only of the dawn, referring to what is needed "at this hour of the morning." He seeks to face the crisis of the churches with that of the age, in order to summon their common Christianity to its social task as "to the new crusade." Modestly claiming new achievements for Christianity in the realm of the individual life and its more personal relationships, he insists that the best it has yet attained is not good enough to meet the need for and the tendency toward socialized life and conditions.

In so doing, however, he fails to recognize as religious, those educational, charitable and humanitarian interests which he describes as having "broken away," "slipped away" from the churches. It is surely as inadequate a view of religion as it is of social service to intimate that if social work is not under "the control of the church" it is losing "all connection" with it; that because social service has "created its own ideals and methods and much of its work goes on outside of the churches," it is therefore done "with little reference to religion." The fact is that such work is more and more identified with and considered a part of religion. And in the broader conception of the church now held very many of the agencies organized and at work beyond the immediate control of ecclesiastical authority, really are the church at work for the world. For surely the Church is greater than the churches. The animating, initiating, organizing, achieving spirit within it is greater than its ecclesiastical forms of organization.

Nevertheless, Professor Batten fearlessly faces Christianity with its social task, to socialize the individual and to christianize human society. In a very incisive and constructive way he bears this task home to the heart and conscience of the church as the supreme test of its loyalty to

<sup>1</sup>*Spiritual Culture and Social Service*, by Charles S. MacFarland. Fleming H. Revell Company.

<sup>2</sup>*The Social Task of Christianity* by Samuel Zane Batten. Fleming H. Revell Company.

its great commission and to its present opportunity. In so doing he has made one of the first constructive attempts to state the program and method of the church's social action. While dealing concretely with general terms, his broad outline includes plenty of room and many suggestions which appeal to be filled in and carried out by the worker on any local field.

The Rev. Frederick DeLand Leete, a working city pastor who has recently been elected bishop of the Methodist church, has been led by the religious social interests which he has shared to study for the last ten years the teachings underlying the movements for brotherhood.<sup>1</sup> In a rapid though interesting series of glimpses at the men and the fraternal organizations which have characterized Christianity from the earliest times, he has gathered valuable notes and references, not accessible to the general reader elsewhere, in a very readable volume and in an arrangement which facilitates ready reference. His treatment appeals to more readers and interests, because it includes the trade and social fraternities, such as the old gilds, the educational brotherhoods of teachers and literateurs, the military and secret orders, such as the old knights and the modern free masons, the humane and philanthropic fraternities, and the political, temperance and insurance or benefit orders, some of which are not usually regarded as distinctively Christian.

It will surprise most readers to know of the great variety of human service rendered at great personal cost by these volunteer brotherhoods, most of which were avowedly Christian, that long anticipated and surely led the way to the humanitarian care of the dependent, defective and delinquent classes which the tax-payers now take upon themselves. It will also be a discovery to learn how many of our most modern movements were long ago anticipated by the old church and its "brothers." Brotherhoods of bridge-builders and Christian knights kept up the highways and protected them from robbers, before the civil government attempted this task. Out of rough and dissolute freight handlers and porters in mediaeval Florence, the Christian spirit made "Brethren of the Misericordia," who still respond to the call for first aid to the injured or the last care of the dead with their litters and in the masks of their modesty. Fore-runners of our Red Cross, visiting nurses, prisoners' aid, friendly loans, legal aid, juvenile protective associations and free schools are all found in these pages to have been at work.

While the historic continuity and interest of the story drop suddenly when the attempt is made to weave the disconnected and stray threads of Protestant brotherhood movements into it, yet this compendium of their names, dates and successive aims, some finely fulfilled, more of them unfulfilled and evanescent, is all the more valuable for permanent reference because of the fugitive character of the information. The one overpowering feature of this historical review is our dependence along all

lines of progress upon the co-operative unity in the kinship of the serving spirit. This is the binding thread that gathers and holds together these scattered lives and these diverse movements in the one volume of the book of life.

Professor Alva W. Taylor of the Bible College of Missouri sums up 'The Social Work of Christian Missions' in a text-book for mission classes which is also a most readable resume which will surely interest in each other's fields those well informed about missionary and social work. Again the foreign mission field best demonstrates the common aims, the common ground and the common methods of religious and social workers. There the exigencies of the field have forced social, philanthropic, industrial expressions of the Christian spirit and the co-operative unity of the churches, faster and further than in the home lands of Christendom. If ever a reunited Christendom is achieved, it will come as a direct return, as well as by a reflex influence, from the work of the church for the world at large on foreign mission fields. The outward and inward flow of the forces and results which are making this history are well grouped in this glowing volume.

Of unique value for its suggestions of the specific needs and near-at-hand opportunities for the social work of the churches, are R. Fulton Cutting's Kennedy lectures.<sup>2</sup> They caught the overflow of his long and many sided experiences in religious work, as warden of St. George's—the first and most experienced church of the institutional type; in the administration of charity, as the president of the New York Association for Improving the Condition of the Poor; in New York city politics as the former president of the Citizens' Union; in education and research as founder of the Bureau of Municipal Research, and on the board of the New York School of philanthropy, to whose students this course of lectures was delivered.

Through special inquiries made by or for him, he gathered much information of the social work the churches are attempting, fairly estimated and contrasted it with the more that needs to be and can be done by them. Then in the most enticing and encouraging way he suggests the simple and personal things which churches and their members, singly or together, can do to give and get help by co-operating with the public schools and their teachers, with policemen and officials, with departments of health and their doctors and inspectors, with agencies and agents working for child welfare and the protection of youth. Opening with the identification of the church and civilization and closing with the responsibility of the church for public opinion, this vital little volume cannot fail to vitalize the churches to do many first works needed by their neighbors and fellow citizens, their public officials and body politic as desperately as any part of the old service which religion has ever rendered the community.

## A Tuberculosis Day Prayer

**O** God we pray Thee for all whose vigor is being drained by slow and wasting illness. Strengthen their powers as they battle for their life, and if it be possible, we beseech Thee to restore them and grant them the fullness of their years. If their strength is failing, give them courage still to labor cheerfully and to leave to those who love them dear memories of faith and patience for the distant days.

Since we are all jointly guilty of the conditions which have bred their disease, may we stand by those who bear the burden of our common sin, and set the united will of our community against this power that slays the young and strong in the bloom of their life. May this death that creeps from man to man be a solemn reminder that we are all one family, bound together in joy and sorrow, in life and death, that we may cease from our selfish indifference and together seek Thy kingdom and Thy righteousness which will bring us health and life.

## THE COMMON WELFARE

### STOPPING MENDICANCY IN BALTIMORE CITY

With the appointment recently of eight additional mendicancy officers in Baltimore, Md., increased impetus was given to a new movement to abolish begging and vagrancy in all their forms. The plan calls for the close co-operation of private charitable organizations with public agencies, such as the magistrates and the police department. It is believed to be something new in municipal warfare on the evils of mendicancy.

Like the laboratory of social hygiene established a few months ago<sup>1</sup> at Bedford Reformatory, the plan grew out of discussion at a dinner. Magistrate J. Abner Saylor, in the presence of fellow magistrates, members of the police department, social workers and others, described some of the difficulties confronting the judge who is called upon daily to dispose of scores of beggars and vagrants, many of them "rounders," to the best interest of society as a whole. He was followed by J. W. Magruder, secretary of the Federated Charities, who outlined a plan for solving the problem. This was later adopted by the city, substantially as Mr. Magruder had given it.

The new scheme, which other cities may find adaptable to their needs, calls for the creation of practically no new machinery in municipal government. In Baltimore a plain clothes man was assigned to duty as a mendicancy officer. His first obligation was to observe the distinction between beggars and vagrants, the beggar being a resident of the city, the vagrant a non-resident

or homeless person. Instead of arresting the beggar on sight, the mendicancy officer warns him that he is violating the law and is therefore liable to arrest and punishment. He conducts him to his home, leaving him there with the assurance that his condition will be reported at once to the Federated Charities, the Federated Jewish Charities or the St. Vincent de Paul Society. It is agreed by these societies that the proper one will visit the beggar promptly and deal with him as with any other case of need, guaranteeing emergency relief, investigation and adequate treatment. Thus it is rendered unnecessary, the originators of the plan contend, for him to resort again to begging. In case he repeats the offense, the officer arrests him and the proper society appears in court, along with the officer, as witness against him.

In the case of a vagrant, the mendicancy officer has no alternative but to arrest. Vagrants under sixteen years of age are taken at once before the juvenile court, to be dealt with in the same manner as other juvenile offenders. Vagrants between sixteen and twenty-one are sent to the proper custodial or correctional institution, the magistrate having no power under the law other than that of commitment. The prisoner may, however, be held in custody for a reasonable time, pending an investigation by one of the three societies mentioned. If it be ascertained that the prisoner is a runaway child, a defective or a delinquent of any kind, who should be restored to parents or friends or public authorities, the magistrate may release him in such custody as

<sup>1</sup>See THE SURVEY, May 18, 1912, page 285.

the case may require. A similar procedure is used in the case of adult vagrants, except that if the investigation requires a long time, a jury trial may be asked for by the state's attorney. If the accused be found to be a deserting husband or a mental defective, he may be released. Otherwise, he may be brought to trial and committed under the law.

It is declared that the working out of this plan has made Baltimore freer than ever of mendicants, and it was the recent increase of the staff of mendicancy officers from one to nine which gave rise to a statement that soon all of them would be removed from the streets. The following characterization of the plan is contained in a pamphlet published by the Police Department:

"It secures in every case just and considerate treatment for the accused. It guarantees to the beggar proper and adequate care; at the same time it permanently estops his begging. It protects the city against the nation-wide army of vagrants, estimated at 500,000 in number; and especially against the influx of vagrants from neighboring cities and states, where laws against vagrancy are beginning to be vigorously enforced. It is hoped that this method of individual investigation, and of fair and humane but firm and consistent treatment, will be a genuine contribution to a national crusade against vagrancy, which is now being definitely planned."

#### GOVERNOR MARSHALL ON SOCIAL POLICIES

Indiana is reaping the advantage of having long sustained one of the best of all state boards of charities and correction, under the leadership of one of the most effective secretaries—Amos W. Butler. The tribute paid to both by Governor Thomas R. Marshall on a recent public occasion was felt by those who listened to be as well deserved by them as it was creditable to him. Not the least gain to the state from their labors and his may be the fact to which the governor bore generous personal testimony that he himself had been led by them to "give up many of his own notions" in order to help along social policies in which they believed.

In enumerating some of these policies Governor Marshall took as his text the title of a sermon by Albion Fellows Bacon which appeared in *THE SURVEY* of October 5: "The Divine Call: Follow Me." The planks in Indiana's social platform for which he stoutly stood include the continuance of the careful supervision of town expenditures for relief by county authorities and the registration of every case by the state board; a farm colony for the insane, like the state's successful village for epileptics; preventive sanitary and medical care of infectious and contagious diseases; central temporary homes for dependent children, while waiting to be placed out in

families, as substitutes for local asylums, or "orphans' homes," which at best can only be "public boarding houses"; county jails to be used only as places of temporary detention of short-term prisoners, while waiting commitment to penal farms, where they should work out indeterminate sentences, "not for the state, but for their own keep and reformation and for the support of their families."

#### TOKIO, BERLIN AND THE COST OF LIVING

The New York *Sun* recently carried news letters from Berlin and Tokio, which give point to the movement urged by Prof. Irving Fisher and others for an international inquiry into the cost of living. The paragraphs were published on different pages and had no connection one with the other. Brought together, they are seen to be different faces of the same stone which the world seems to be getting in its search for bread.

The Berlin despatch tells of a series of tables based on official statistics, which have been published by the merchant elders of this German city, showing how the rise of food-stuffs has reached a point where it is provoking public meetings throughout the Empire:

"The two five-year periods, 1901-1905 and 1906-1910, are compared with last and this year and the result indicates that, apart from a decline in one or two articles in 1911, which was almost entirely due to the shortage of fodder crops and the consequent forced sales of live stock, a general and rapid enhancement of the prices of the principal articles of food has been in progress since the beginning of the century.

"As compared with the averages of 1901-1905 the prices of leading comestibles in Berlin last July showed the following increases, all by the English pound, in cents: Rye bread, .64; wheat bread, 1.48; beef, 5.56; veal, 4.9; mutton, 5.76; and pork, 4.64.

"That is to say, wheaten bread has gone up 1½ cents and meat on an average over 5 cents a pound during the twelve years covered by the figures. This rise of prices for some months past has been agitating the German nation to an unprecedented degree, and not a day passes but some municipal council or other public body makes it the subject of long and earnest deliberation.

"Hundreds of public meetings throughout the empire have petitioned for a complete or partial suspension of the import duties on food-stuffs. In particular there is a widespread demand for chilled meat, which for one reason or another is practically unknown in this country.

"Should the rise of prices continue the government will be in a very awkward predicament. Every rise in the price of food means an accession of strength to the socialists."

The Tokio despatch tells us that the death of the emperor only "temporarily checked the discussion and consideration of what remains and must remain for a long time the most important

affair in the state, the condition of the lower classes. To quote the semi-official *Japan Times*:

"The cost of living keeps going up. No one seems to be able to reach out his hands to bring the steadily ascending balloon to the ground; people helplessly watch its course and gasp. At the same time poverty walks about at large and the miseries of life increase. Above all the heads of families of the laboring class seem to have the worst allotment of miseries and tortures. Many of them are daily deserting their wives and families.

"The laboring men cannot support their families with the scanty wages they get. The little storekeepers find it impossible to balance their ledgers with the credit ahead of the debit, and are universally discouraged by dull business. At home their wives need money and their children are simply crying aloud from starvation.

"The hard pressed and miserable husbands go out in the morning to search for work and many of them never return again at night. Daily the charity lodging houses are crowded by women and children begging a night's lodging, to drift away the next morning, to return again at night starving. Many of them are sick, husbandless and fatherless, penniless and homeless. Some of them follow the paths of their husbands to death.

"The general hard times in Japan are making themselves felt in ways that mean increased difficulties for the government. The heavy increase in crime means increased outlay on prisons and prisoners' food."

#### PRISON EXPERTS TO COLLECT DATA

When the American Prison Association comes together in Baltimore next month an added earnestness may be given to its discussions by the unusual succession of convict uprisings and prison scandals which have aroused the citizens of several states the past year, notably in Nebraska, Michigan and Wyoming. Similarly, an increased interest is felt at this time in a step just taken by the International Prison Commission, which met recently in Paris to make preliminary arrangements for the 1915 international congress at London. This was the decision that the commission shall, in addition to preparing for a congress, make its central office an agency for collecting and distributing reliable information in relation to correctional and preventive methods. In friendly and helpful relations with governments and international scientific associations the commission proposes to engage in systematic investigation of the subjects which come within its scope. For this task it has some special advantages, since most of its members are officials of the national administration of prisons and all of them are officially appointed by governments and interested in private societies for the study of prison science, the care of prisoners and their families, or the reformatory and preventive measures affecting children and youth. The secre-

tary, Prof. Simon Van der Aa, is well equipped for the task of conducting this series of studies, the results of which are to appear ultimately in bulletins of the commission. The information thus collected will be sent by the bulletins to contributing governments, individuals and associations of specialists, and thus the fullest publicity will be assured.

In order to meet the greatly increased expense of this advance movement, the different governments represented will be asked to contribute the maximum amount (\$10 per million of population) instead of the minimum sum, or half the maximum, which is totally inadequate. Several governments have already intimated their readiness to pay the larger sum, and it is hoped that the United States Congress will not lag behind. Even then it is feared that the amount expected will be inadequate for the most fruitful prosecution of studies and for full publication of results; and so it is expected that private endowments or funds will be asked for this extended service. Many on the commission think that perhaps nowhere else could money be used with such good effect in the conflict with crime, with such direct command of the resources of government and of the influence which accompanies high authority.

The American Prison Association, the American Institute of Criminal Law and Criminology and other organizations interested in correction and reformatory measures will be invited to help promote these objects in the United States. It is pointed out that this is especially appropriate because Americans, and especially the late E. C. Wines, once secretary of the New York Prison Association, took the initiative in securing the foundation of the International Prison Commission by the action of the sovereign powers of Europe. This honor, many think, involves special responsibilities.

The commission agreed to postpone the final choice of subjects for the congress of 1915 until next year.

#### NEW YORK FOR SOCIAL CENTERS

New York has invited the national and county chairmen of the five leading political organizations to use public school buildings for evening mass meetings. The New York County Progressive Organization held the first meeting in accordance with the invitation on October 18.

This step toward the socialization of the school plant followed close upon the heels of the success of Herman A. Metz, former city controller and now a member of the Board of Education, in inducing the committee on the care of school buildings to open experimentally seven buildings as political and social centers.

The schools selected all have spacious auditoriums and are accessible from every part of

the various boroughs. For these political meetings a charge is made. The Socialist Party has decided not to accept the offer of the Board of Education on the ground that this fee, which is \$28 for five of the seven schools, is excessive.

Special agents of the Board of Education are to attend each meeting to see that school property is not abused. Their reports will go far to determine whether the newly inaugurated movement for making the school a social and political center in the community is to be extended or discontinued.

THE CUSTODIANS OF OUR SKYSCRAPERS

The figures on scrub women given by the Riverside Improvement Association of Brooklyn in THE SURVEY of June 8 reveal a woman's trade in which wages fall far below the cost of living and are supplemented by family or community aid. Six dollars is by common agreement too low a wage to support a young saleswoman with no dependent family, but it turns out to be an unusually high rate of pay among scrub women, the vast majority of whom have others dependent or partially dependent on them.

In turn, just as male salesmen are many of them unable to maintain a family on their wages, so the male unskilled worker in an office building is in no position to be a married man, in the old-fashioned sense of a father supporting his family. Taking male and female help together, office building work in New York is a clear case of a parasitic industry, which, in common with an increasing number of other industries pays wages graded to the principle that the actual modern basis of family support is the earnings of the family—mother, father and children combined. A study of unskilled male workers in twelve office buildings, based conservatively not on the statements of the workers themselves but on the superintendent's payrolls, forms an interesting supplement to the story of scrub women's wages.

These workers can be classed roughly as porters, engine-room helpers, night watchmen and elevator men. The buildings studied employed staffs of from fifteen to seventy-five, thirty being the average. There was no model building among the twelve, though one or two made a model of some one feature or some one group of workers. Some paid unusually high rates for a particular type of labor. One cut its hours down as short as possible; another cut the hours of engine-room men only on the ground that the work was especially hard; another gave a long vacation to this group for this reason; three, and only three, gave increase of pay with length of service in some occupations; another deemed

shoulder straps without increase of pay sufficient reward for long service.

The total number of men employed was 340. The largest group, almost half, were those connected with the elevators and halls, the functionaries of the building, whose work must be monotonous and unsatisfactory to a man who has not been at it long enough to become an automaton. The majority of this group, though not a very large majority, were unmarried. Almost all in the remaining miscellaneous group of men who do the laborious work of an office building were married men in the prime of life. Scales of weekly pay are shown in the following table:

NUMBER OF BUILDINGS GIVING WEEKLY RATES OF PAY AS FOLLOWS TO GRADES OF SERVICE NAMED<sup>1</sup>

WEEKLY RATE OF PAY.	TO ELEVATOR MEN.	TO HALL MEN.	TO PORTERS	TO WATCHMEN.	TO FIREMEN.	TO UTILITY MEN IN ENGINE-ROOM
\$ 9 1-3 . . . . .	12 . . . . .	1 . . . . .	3 . . . . .	1 . . . . .	1 . . . . .	5
10 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	7
10 1/2 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
11 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
11 1/4 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
11 3/4 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
12 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
13 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
14 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
15 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
16 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
17 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1
17 1/2 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1 . . . . .	1

In this table the poorest paid worker is shown to be the porter who begins at the lowest wages, \$9.33, and in no case rises above \$12. Next to him is the elevator man who, in no case, goes above \$14. The general utility man in the engine-room is strictly limited to two rates of pay, \$12 and \$14. The fireman in not a few cases earns higher pay as he often has some of the duties of an engineer. The most general rates of pay among all classes of workers are from \$10 to \$15. Where pay in a few buildings is higher than this it is only for groups containing few workers.

Skilled positions, such as engineer or machinist of which there are few, are omitted from the table, as of course is the superintendent. In some of the largest buildings a janitor, a head porter or a head hall man was employed in the supervisory position of superintendent's assistant. There were sixteen of these positions. The pay of the janitors so employed ran from \$14 a week and rooms to \$25 and rooms; that of head porters from \$15 to \$25 a week, and that of head hall men from \$15 to \$18.

A few of these represent an increase of pay of only a dollar or two over regular porters' or hall men's pay, others a very considerable in-

<sup>1</sup>Fractions of a dollar in the weekly rate of pay are due to the fact that the semi-monthly method of payment is used.

crease. The semi-monthly method of payment, which is very common, saves the building a dollar or so each month for each man. This method is one of the mean economies of modern business. The dollar or so a month means infinitely more—perhaps the saving for a summer outing—to the workers, than it can to the superintendent's accounts.

Possibilities of an outing are, however, rare. Only half of these buildings give a week's summer vacation. One or two give an occasional week end or a fortnightly day off in summer for some groups of workers. Pay is perhaps the primary essential, but leisure, which means family life, is equally essential to decent living. To the rule that long hours and few paid holidays are an almost invariable accompaniment of low wages the office building proves to be no exception.

For porters and elevator men in these buildings six days constituted a week's work, though the elevator men took turns on Sunday which meant an occasional seven-day week.

Seven buildings had a seven-day week for men in the engine-rooms, and eleven out of the dozen buildings had the same for watchmen, though two buildings arranged for a fortnightly night or day off.

Hours are shown in the following table:

NUMBER OF BUILDINGS EMPLOYING SPECIFIED GROUPS OF WORKERS THE NUMBER OF HOURS NAMED:

	ELEVATOR MEN.	HALL MEN.	PORTERS.	WATCHMEN.	ENGINE MEN.
8	.....	.....	.....	.....	1
9	.....	.....	.....	.....	.....
9½	.....	.....	.....	.....	.....
10	.....	.....	.....	.....	4
11	.....	.....	.....	.....	2
11½	.....	.....	.....	.....	.....
12	.....	.....	.....	.....	3
13	.....	.....	.....	.....	1

The worst sufferers from long hours are night watchmen, who are, in eleven buildings, it will be remembered, seven-day workers. They have a thirteen-hour shift in three buildings, a twelve-hour shift in eight. One building has a night engine-room man employed thirteen hours, the day man working eleven. Three buildings have a twelve-hour shift for engine-room men, four have such a shift for porters and one for elevator men.

THE CONSTITUTION  
AND THE POLICE

Though platforms of the Socialist Party, more than others, are accustomed to insist upon the constitutional rights of free speech and assemblage, it seems to be the socialists who are most often interfered with in the exercise of that right. Recent illustration of this was had at Little

Falls, just outside of Utica, N. Y., where a strike of a few hundred workers—latest figures put it at four hundred—has been going on in the Phoenix Knitting Mill. This strike, which was brought on by reduction of pay following the imposition of the fifty-four hour week, has proved the occasion for a free speech fight which has involved persons in the Schenectady Socialist administration, and has brought forth a valuable opinion on the subject of free speech and the police, from the attorney general of the state.

Mayor George R. Lunn of Schenectady was arrested with others for speaking in the strike district when a permit was refused, with the deliberate purpose of testing whether the local authorities had the right to interfere on this ground with the right of free speech and assemblage. The state committee of the Socialist Party, to test the matter still further, started their whole state ticket of five persons for Little Falls and applied through the Socialist representative for Schenectady to the governor and attorney general for protection of their speakers in the forbidden district. Alarmed at the proportions the opposition was taking, the Little Falls authorities, after consultation with the governor, agreed not to interfere with these or other Socialist speakers, and the battle was declared off. The thing of permanent value that has come out of the controversy is the attorney general's opinion, which should, it would seem, make it impossible for New York to become the scene of such interference with free speech as has distinguished California and New Jersey during the last year.

"The constitution of the State of New York provides," says the attorney general, "that 'no law shall be passed to restrain or abridge the liberty of speech or of the press'; also that 'No law shall be passed abridging the right of the people peaceably to assemble.'"

"No disorderly act must be committed: Public thoroughfares must not be unreasonably blockaded. Subject to these restrictions, the right to assemble and hold public political meetings cannot be denied by any municipality, not even by the state itself.

"This right is too valuable to be left with police officers to enforce or restrain. It is one of the highest privileges granted by our government, and is entitled to the most liberal interpretation.

"The attorney general advised Mr. Merrill that the supreme court had ample power to restrain interference with this meeting, or any other meeting, and undoubtedly would do so upon a proper case."

Two New York papers, the *World* and the *Globe*, have published interesting editorials on the trouble at Little Falls. Says the *World* on the subject of the police, "our rulers":

"The Socialist mayor of Schenectady would have been within his rights at Little Falls if he had not undertaken, by means of conversation, to lodge an idea in the head of the chief of the local constabulary. That precipitated a crisis and he was arrested for treason, malpractice or something.

"Most Americans come in contact with government only through the police. Why must that expression of authority in so many cases be arbitrary, unreasoning and brutal?"

The *Globe* asks:

"How long will the constitutional rights of property be respected in this country when the constitutional rights of freedom of speech and assemblage are not respected? Foolish persons are playing with edged tools when they say that in their communities no one shall say anything they don't like—that they will not allow outside agitators to come in and stir their people up."

### FIGHTING VICE IN CHICAGO

GRAHAM TAYLOR

The war against the segregation of vice in Chicago has suddenly assumed city-wide proportions and will call country-wide attention to the acute crisis created. Ever since the vice commission rendered its report to the mayor and city council a year and a half ago, it has been obvious to those who know Chicago best that sooner or later the city administration and its police department, the county authorities and the state's attorney would have to reckon with the appalling situation, which the commission dug up by the roots and held forth in the light of common day.

Upon taking office last April, Mayor Carter H. Harrison was characteristically non-committal regarding the policies recommended by the report, but with his usual political astuteness he at once saw the bearing of its vast body of authenticated facts upon his responsibility for the continuance of the scandals in which the report involved the police. The city civil service commission was thereupon authorized and supported by the mayor in disciplining fifty or more police officials for inefficiency, some officers of the highest rank, longest service and most doubtful reputation being summarily dismissed from the service. Conditions at once improved on the streets throughout the city, and the segregated district of the West Side, which was surrounded by a vast tenement house population, was promptly and effectively closed up. Most of its hundreds of disreputable characters were forcibly driven into the larger segregated district of the South Side, which thereby grew

rapidly both in density and extent. The North Side district was not affected, either by interference or accession. But the domain of the vice kings—the two aldermen of the first ward, including the great business center—was thus vastly increased in power and profits.

Meanwhile two expressions of public determination to make an end of this situation preceded and precipitated official action. A "clean city" demonstration was made again, as it was last year about this time. Such spectacular displays do not appeal to all who oppose and fight against such evil conditions in ways which seem to them more effective. Nevertheless this procession rallied 5,000 people on a rainy day to march through the streets with banners and floats, and it made its own impression upon the city. But it was the vigorous and persistent attacks by Virginia Brooks on the equally vicious conditions in the outlying town of West Hammond which forced the hand of the county authorities. By this exercise of her right and fulfillment of her duties as a property owner there, this young woman has provoked official action affecting the city and suburb alike.

Charged by her directly before the grand jury in the public press not only with responsibility for the existence of these illegal conditions, but with defeating attempts to get legal aid to improve them, the state's attorney took sudden and drastic action. He issued hundreds of warrants for the arrest of the keepers and inmates of disorderly resorts in the segregated district of the South Side and closed up almost all of them within a week. Spectacular citations by *capias*, were also issued upon owners and agents of properties used for illegal purposes.

But, as usual in such spasmodic and cyclonic movements of personal and political motives upon the part of rival, partisan public officials, the results are very mixed and the situation is even more complicated, from the point of view which takes into account the human interests and the public welfare involved. Indeed, it is more than suspected that this complication is not regretted, not to say aided and abetted, by both sets of officials responsible for the situation as it was and is.

Hundreds of the women inmates, thus suddenly thrown out of the resorts, appeared upon the streets, in largest numbers where the big business and the best residences made them most conspicuous and their presence most annoying. They applied to rent rooms and flats in buildings and in sections of the city where it is not likely that many of them would have thought of applying had it not been suggested to them. Through the streets of the district, and past the dark and locked houses from which they had been driven, hordes of men roamed wantonly about, rushing after the patrol wagons, and in

the intervals trying the doors and entering the houses which ventured to keep open while waiting their turn for arrest. Plain clothes "detectives" swarmed over the district, doing little or nothing to disperse the disgraceful exhibition which these gangs of men made of themselves, but alert to discover and play up in the papers any hapless "reformer" and "uplifter" to be found there after dark. Salvation Army and other evangelistic groups added their songs, banners and excited appeals to the indescribable confusion of the sordid and morbid midnight scene.

Out of it all some permanent good is resulting. It has been shown that the segregated district can be summarily closed, and therefore can be permanently abolished. The officers of the law and the courts who can do it, who are doing it, or who have done it are officially and personally designated. The "special interest" of commercialized vice, although estimated by the vice commission as amounting to \$15,000,000 a year, has not proved itself able to protect itself from all the legal resources at the command of the community. The aggressive, well manned and managed agencies fighting commercialized vice and struggling to rescue and defend its victims have demonstrated the power of public sentiment, when only partially organized, to enforce the law, even by the hands of reluctant and pliant officials at odds with each other. The women who have led the forlorn hope in keeping open ways of escape from the human shambles protected by the authorities, into refuges and homes for their "fallen" sisters who seek to rise, have had their inadequate support sufficiently increased to warrant them in offering to take in any woman who is either out on the streets or who is in worse durance within doors.

Thus far, however, few if any of the dislodged women have taken advantage of this offer. They are supposed to be temporarily cared for by the resort keepers in hope of an early resumption of their illicit traffic.

The real estate dealers and agents are taking steps to present a solid front against the encroachment of denizens from the closed district upon residential sections and other buildings under their care. Owners and agents reported by the recorder of deeds to the state's attorney as renting property for illicit purposes are pledged immunity if they will promise the prosecutor to evict all immoral persons from their property.

At the call of Clifford W. Barnes, chairman of the Committee of Fifteen and head of the Sunday Evening Club, a mass meeting was held in Orchestra Hall to protest against further tolerance of the segregated district.

But best of all is this public demonstration of the shame, irrationality and futility of such a planless, purposeless spasm of law enforcement, without any preparation or provision for controlling its immediate effects so as to reduce the

harm to the minimum and to secure the permanent good of the community and the individuals involved. If anything were needed to prove beyond question the necessity of some public policy toward the social evil—such as the vice commission recommended, or any other policy that would be better than none—the present situation exhibits it. It will be worth all it costs if the self-respect of the great city shall at last be awakened and aroused to the point of demanding the mayor's serious consideration of the vice commission's recommendations and the serious and sustained enforcement of the law at the hands of the police, the state's attorney and the courts. The mayor's preposterous proposition of a referendum vote to record the people's preference for or against the segregation of vice, in direct contravention of the statute law, is likely to be anticipated by an imperative mandate of public opinion, which will be heard and heeded by him and all officials whose sworn duty it is to enforce the law.

\* \* \*

Since the foregoing statements were written, the City Council of Chicago has taken action, appointing a committee of nine aldermen to investigate and report recommendations. In the light of the tense situation, and in view of the fact that the thorough investigation and recommendations of the Vice Commission officially reported to the council in 1911 are still ignored as they have been for a year and a half, the language of the preamble and resolution is curiously interesting.

Whereas, The Social Evil is a problem of such importance, that we, as city representatives, should investigate and report our findings and recommendations thereon in an efficient manner; therefore,

Be it resolved by the City Council of Chicago that a committee of nine be appointed by His Honor the Mayor . . . to take up the investigation of the Social Evil in a thorough and systematic manner in all its phases, causes and cures, and based upon the findings of such investigation, make recommendations to this body, as to its elimination or segregation, or otherwise, as may be deemed most advisable by this committee; and that the committee make its report to this body as soon as it conveniently can do so after thoroughly investigating the subject.

To the request of some members of this committee that the state's attorney should allow the reopening of the segregated district for thirty days while the investigation is being made, that official promptly and emphatically declined to do so, asserting that while he was in office, every disorderly house there or anywhere else in the city would be closed and kept closed. Meanwhile, the council committee by a good majority has voted against secret sessions and thereby left the way open to public hearings.

## COMMUNICATIONS

### WOMEN AND THE SUFFRAGE

TO THE EDITOR:

In an editorial in *THE SURVEY* of June 1, concerning Votes for Women and Other Votes, Jane Addams called attention to the relation of woman suffrage to the ever-widening application of the principles of democracy.

Every new effort to throw light on the relation of suffrage to the general welfare should be received with fair consideration and an effort at full understanding. A very careful reading of Miss Addams' propositions leads me to question her historical accuracy, as well as her interpretation of the facts she deals with. She gives an impression of reading back into history and into the accepted principles of democracy her own emotional bias. She puts aside her practical experience of the value of the franchise to the individual or the class (see her book on Hull House), in favor of a sentimental or emotional theory of the way the vote ought to work toward the public good. When she assumes that the extension of the franchise proceeds by orderly steps each extension being the cause or the reason for the next she loses sight of the historical fact that the movement of governments toward democracy has been retrogressive as well as progressive, and that the evolution is not determined by demand (demand being only a minor factor), but by pressure of those changing conditions which make it expedient either to extend or to contract the limits of political responsibility and power. In military Rome the suffrage was a matter of military expediency. In the commercial towns of the Hanse it was a commercial expediency. In the England and Germany of the nineteenth century industrial evolution forced political evolution. While in America the enfranchisement of the blacks was purely political expediency, a mistaken expediency, as proved by experience, although school text books present a perverted view of it.

She fails to see, also, that to include women in government is not an orderly progress, but an erratic movement, since women have not the same relation to government that men have. It is a different proposition wholly, involving enormous social and industrial changes. All extensions of suffrage to men have due reference to the man's power to support his authority by force when necessary.

When Miss Addams urges the "readjustment in relation to changing experience" she fails to discriminate between organic and statutory law. Our constitution is based upon the unchanging principles of representative government. We cannot pretend that those principles do not exist. We must obey the law upon which they rest, or suffer in our national welfare.

But the change which she declares to be essential is a change easily within reach of

the people,—a change made easy by the wise foresight of the framers of the constitution, without any enlargement of the franchise.

I have heard it said that Miss Addams believes the salvation of the country depends upon giving the vote to the immigrant women; and her next paragraph seems to confirm this. Because there are more illiterate or ignorant or stupid or vicious people in any nation than wise and experienced people, it by no means follows that it would be to the interest of the former classes to allow them to dominate on a basis of mere majority of numbers. Quite the contrary. Democracy itself would curl up and die under such an application of democratic principle.

Her fallacies are well indicated in her closing sentence: "Then only when all the people become the governing class can the collective resources and organizations of the community be consistently utilized for the common weal." Does she mean to include fully the ignorant, the minors, the insane, the criminals and aliens?

It seems to most of us that the franchise should be limited by the welfare of the nation. Government is only intended to give the governed a chance to live in safety and peace. All other organized policies are extra-political. And the opportunities of women to work for the public welfare are much greater out of politics than in politics. Miss Addams's book on Hull House makes that clear; and so, on the democratic principle that government is for the benefit of the governed, it would seem that Miss Addams is not justified in her appeal for this extension of the suffrage. It has by no means been proved that women can serve the state or society as well as voters, as they can as non-political agents.

### LIVING ON A SALARY IN 1912

TO THE EDITOR:

A faithful reader of *THE SURVEY* and a sincere sympathizer with its aims and with the causes which it advocates, I have been watching its pages hoping to find a study or a presentation of a problem that is giving anxiety to some thoughtful people. All these movements for increasing the wages of shop girls and of laboring men, for shortening the working day, for insurance against accident, sickness and the like, must raise prices. (At least, I have never seen that denied). What is to become of the people who live on fixed incomes, the salaried folk?

Here in New Jersey the new Employment Law with its provision in regard to domestic servants, is forcing householders to insure and so increasing the budget. This is a concrete instance of what must, it appears, be in effect a result of all such measures. What is to become of the people who cannot increase their incomes—or not to a degree that makes any special difference; who do not belong to the laboring class? I am asking these

questions in no carping spirit. I am in full sympathy with all these reforms, but I cannot see the outcome as concerns me and my kind. If you should think it wise to discuss this matter in *THE SURVEY*, I should be deeply interested. And I believe I am one of a class.

## PRINCIPLES OF COMPENSATION

TO THE EDITOR:

All workmen's compensation legislation is based upon the theory that the cost of human wear and tear should like the cost of raw material, machinery, etc., be thrown upon the industry and included in the price of the product. An examination of the compensation legislation of different countries shows three general principles or methods of applying this theory. These principles may be respectively termed the principle of individual liability, the principle of collective liability, and the principle of state liability.

*Individual Liability.*—Under this principle the liability to compensate the workman is thrown upon the individual employer as an element of the relationship of employer and employee. The injured employee looks for his relief directly to his employer, who thus becomes an individual insurer of the workman against accidents. The principle of individual liability is illustrated in the English Workmen's Compensation Act under which employers in every occupation are required, regardless of fault, to compensate any injuries sustained by a workman in the course of his employment, employers being of course permitted to insure themselves against this liability by taking out employers' liability insurance. The act of the state of New York recently held unconstitutional, and the acts in New Jersey, Wisconsin, New Hampshire, Illinois, Kansas, California, and Nevada, as well as the act being introduced in congress, are of the same class as the English act.

*Collective Liability.*—Under this principle the liability to compensate the workman is thrown upon employers collectively in groups according to the industry or the hazard of the occupation. Employers are encouraged or compelled to combine in associations for the purpose of insuring workmen against accidents and providing the funds for the purpose. The injured workman looks for his compensation, not to the individual employer, but to the association or the fund. The principle of collective liability is illustrated in the German system under which employers are grouped by industries under state compulsion and supervision and required to provide compensation for workmen injured in the industries included in the groups. The acts recently adopted in Massachusetts and Michigan are evidently intended to evoke such a system though they do not directly provide for it.

*State Liability.*—This involves the assumption by the state itself of the obligation to pay compensation, the cost being levied upon employers, or employers and workmen jointly, through the agency of the taxing machinery of the state. The workman looks for his compensation directly to the state. This principle is illustrated in the acts of the states of Washington and Ohio. Under these acts the compensation is paid out of a fund administered by a government commission, and the cost is levied as a tax upon industries classified according to risk.

The principle of individual liability is pronounced with singular unanimity by impartial investigators and authorities on workmen's compensation as a failure in practice and as essentially wrong in principle. It involves a violation of natural justice in throwing upon the employer a liability for something not his

fault. It is not an accidental misfortune that the American constitutions render it difficult, if not impossible, to enact a measure of the English type. The constitutional provisions which create the difficulty are in reality expressive of principles of natural justice. A burden which may with justice be placed upon a group or class may be entirely unjust when placed upon an individual. The individual system necessitates also a direct contest, legal or quasi-legal, between the employer and employee in the establishment of each claim for compensation, and the circuitry of liability involved in employers' liability insurance entails a waste of a large, if not a major, portion of the money paid by the employer. The English act and its counterparts in various parts of the British Empire and various states of the American Union are generally regarded as representing merely a stage in the development of a satisfactory compensation system. The operation of systems of this character has proven anything but satisfactory either in method or in result.

The principle of collective liability as applied in Germany and some other countries is generally pronounced successful. The German system is recognized as the type in efficiency and economy and none of its defects appear to be vital.

The state liability systems are equally approved by impartial investigators. The state insurance systems of Washington and Ohio are in reality centralized systems of collective liability. The Washington system has been described as a collective insurance system under state administration. The experience of other countries leaves little room for doubt that a state liability system represents the ultimate solution of the problem. The recent criticisms of the German system by Dr. Friedensburg point to, and in fact recommend, the assumption by the state of a more direct share in the administration of the compensation system of that country and a broad survey of the whole field of compensation certainly supports his view.

## SOCIAL SERVICE IN ITALY

TO THE EDITOR:

The *Associazione Italiana di Liberi Crendenti*, formed some time ago to meet certain of Italy's urgent social needs,<sup>1</sup> has issued a report on the work of its first ten months. Utterances of university professors, public officials, parish priests, and Protestant ministers of Italy seem to indicate that the country is ready for such a campaign in behalf of social betterment as Anglo-Saxon countries are today going through. The society, of which Signor Gaetano Conte is general secretary, has headquarters at 44 via Margherita, Florence. One means of advertisement which it has adopted is that of distributing gummed labels for general use. Among the mottoes are the following:

<sup>1</sup>See *THE SURVEY*, Oct. 21, 1911, page 1022.

"Spend only where there are really fixed prices and you will moralize commerce";

"Every lottery is an immorality and our government teaches it to us";

"A frequent bath prevents sickness and disgust";

"Tips are proofs of abjection. Be ashamed to ask." M.

### THE SERVANT PROBLEM

TO THE EDITOR:

House work, the bane of the mistress, is as well the bane of the servant; yet houses must be kept clean and orderly for decent living and the family must be furnished with nourishing food. With the increasing difficulty to supply the demand for servants, with the constantly rising scale of wages, how is the work of the family of average means to be done? Does the problem resolve itself into the mistress doing her own work with occasional day help, or does the family take to a boarding-house existence or to a semi-family way of life in a small apartment with a kitchenette? With the rapidly increasing number of apartment houses containing two-, three-, or four-room apartments it would seem that this last way was gaining a foothold in American life and that the home of the past generation had already become historic.

For some years efforts of various kinds have been made to solve the problem, yet apparently without success. Schools of domestic science have been inaugurated to elevate the various phases of household work to the point of professionalism, an effort has been made to raise the social standing of the girl in the kitchen—yet the problem has remained unsolved. The only recourse left has seemed to be a higher standard of wages with a lessening of tasks imposed. And yet, is the problem solved?

A suggestion of co-operative housekeeping has been made, but this has not gained favor because it seems an infringement upon private family life. The apartment life, though demoralizing in many respects, seems to preserve some privacy of family life and is preferable to a communistic plan. So the question before us is how to preserve the family life and get the hard work done. We can not suggest any plan which involves social differences—we must do away absolutely with "mistress" and "servant," there must be no thought of social superiority or inferiority in the relation of workers.

The functions of the home have been gradually taken from the home and socialized—for instance, religion, education, and industry. Now it remains to socialize domestic work. How is this to be done? It has already begun in the establishment of bakeries, *delicatessen* shops, laundries, etc., but we are at the mercy of private profit in these concerns. Why do not women study out a plan of domestic management which will place in their own hands these bakeries, *delicatessen* shops, laundries, etc.? Would it not be possible for a group of women to establish a bakery on a profit-sharing plan, where hygienic

modern conditions would exist, where all materials used would be pure in quality, where all the workers would have common interest, and where "servitude" would be unknown? If these women, instead of going to the club and talking about solutions, would set to work actually to develop a scheme of supplying pure food on an economical basis and putting it into the homes, then half the problem of domestic work would be taken care of. Profit-sharing schemes could be developed to take care of laundry work, cleaning, and other domestic activities which as carried on now are wasteful of energy and money. The average wage paid to a servant doing general house work is \$5 a week or \$260 a year. The average expense of maintaining a servant is \$2 a week or \$104 a year, making a total expense to mistress of \$364 a year. This amount contributed annually to a profit-sharing plan should make possible a return equal to the service rendered by the hired help.

Flour mills, merchandise houses, banks, and other commercial enterprises may well continue to be in the hands of men, but may not women enter into the larger field of their traditional occupations through profit-sharing bakeries, laundries, cleaning processes, etc.—thereby rendering to themselves and to society a wholesome solution of the evils of present day housekeeping?

GRACE PUTNAM POLLARD.

Minneapolis.

### PUTTING IT UP TO PHILANTHROPY

TO THE EDITOR:

We live in an age of inquiry, an age of research, and are fast coming to an age of applied science, of preventive science.

Typhoid fever, yellow fever, and small-pox have practically disappeared as epidemics from civilized countries, and individual cases have almost been rooted out of our army; why not do away with the idiot, the feeble-minded, the insane, and the hereditary pauper?

It is now thoroughly understood that these classes are not in existence by chance; they are bred from the seeds of their fathers. This was already known in ancient Greece and now in modern England Sir Francis Galton has proved it to be true.

The University of London has established a Laboratory for National Eugenics, which publishes a lecture series in pamphlet form. These brochures can be bought for 5 cents apiece and obtained from the publishers, Messrs. Dulau and Company, No. 37 Soho Square, London, West.

Some of the titles are: The Scope and Importance to the State of National Eugenics, by Karl Pearson, and, by the same famous author, The Groundwork of Eugenics, The Problem of Practical Eugenics, The Influence of Parental Alcoholism on the Physique and Ability of the Offspring; another is The Relative Strength of Nurture and Nature, by Ethel M. Elderton. The laboratory also publishes memoirs which deal with the subjects at greater length.

There is also the English Eugenics Educa-

tion Society with its quarterly *Review*, which everyone interested in the science of the human race should read; their address is No. 6 York Building, Adelphi, London, W. C.

There is for this country the eugenics section of the American Breeders' Association; this is, so far as I know, the only American society devoted to this most important subject.

It now being an established fact that the feeble-minded, the delinquent, the idiot, the hereditary criminal, and the hereditary pauper can be prevented from being born, why do we not prevent?

Every year we in this country increase enormously our appropriations for the care of the insane, the feeble-minded, the idiot, the criminal, and the pauper; this is made necessary because every year there is an enormous increase in these classes. But why do we not get at the root of the matter and prevent the breeding of these people?

Every lying-in hospital is full of delinquent women bearing children who should never have been conceived; if every feeble-minded person were sterilized early in life, within one generation an enormous decrease in this class would result; if every feeble-minded person were segregated during the reproductive period, the same advantage would result.

Instead of decreasing our own unfit classes, we go on adding to them by admitting every year thousands of unfit immigrants. We then commit our unfit to institutions for short terms and often put a premium on the birth of unfit infants, by relieving the mother of her responsibility of the child and setting her at liberty to bear more children.

It is estimated that there are tens of thousands of delinquent aliens, public charges in this country, who might be returned to the lands from which they came; and it is said that we are spending one hundred million dollars a year on the care of those who are public charges. One-tenth of this sum would suffice if practical eugenics were applied, and reforms preventive rather than environmental were enforced.

Come! Why not deport these unfit, and, instead of demanding more funds for the institutions, use them for the segregation of our own delinquents?

Three states have passed laws for the possible sterilizing of these classes; why does not every state do so? It is just as possible to prevent the birth of delinquents, idiots, feeble-minded, hereditary criminals, and hereditary paupers as it is to prevent typhoid and yellow fever; why isn't it done?

Cambridge, Mass.

J. B. PEABODY.

## THE CLOTHING BUREAU

TO THE EDITOR:

When Annie Nathan Meyer suggested in *THE SURVEY* "that some method be devised for handing slightly used clothing over to self-respecting working women who do not care to apply to the usual charitable agencies,"

<sup>1</sup>See *THE SURVEY*, February 24, page 1806.

many readers were perhaps unaware that such an institution already existed in New York. Yet the clothing bureau, with headquarters at 138 East 22d street, recently issued its eleventh annual report. According to the author of this the bureau "is a purely non-sectarian charity, which was started by Julia Lathers in 1901 in order to furnish the much-needed link between superfluity and privation. It began in one room but has expanded to two full floors and to include many departments besides that of cast-off clothing . . . . At a merely nominal price it sells its goods to the worthy poor and individuals and families who are dependable on small incomes. Teachers, students, saleswomen, actors, temporary sufferers from loss of position because of health, struggling workmen of all sorts" are among its customers.

Everyone who buys is required to furnish a reference from some clergyman, priest, or rabbi. From the pages of the report it is evident that a great variety of things find their way through the bureau to grateful purchasers. One invalid, for example, who had frequently waited two hours for her glasses to be picked up off the floor, was enabled by a pair of pick-up scissors bought at the bureau to regain her glasses at once when she dropped them. For an old deaf man, who had but a few days to live, an ear trumpet was bought, "and the family were cheered in being able to make him hear what he so much wished to listen to." W. D. L.

## WORK FOR NEGROES IN BALTIMORE

TO THE EDITOR:

Baltimore is taking an important step in federating its philanthropic activities among colored people. A number of associations and clubs conducted by colored people which are carrying on work among the Negro poor have formed a federation under a director. This autumn, among other activities, there will be a day nursery and a social settlement, the buildings for which have already been secured by the clubs. The federation will work in connection with an advisory board of white people of which Elizabeth Gilman is chairman.

The director chosen for this work is Mrs. Sarah C. Fernandis. M<sup>s</sup>. Fernandis is a Hampton graduate, and has taken the summer course in the New York School of Philanthropy. She has worked for six years in Washington, D. C., at first as a friendly visitor for the Associated Charities under the direction of Charles F. Weller, and later as head worker of a social settlement in a neglected Negro quarter. She made a marked success of her cottage settlement which became the center of a healthy neighborhood life. In 1908, she accepted a position at East Greenwich, R. I., where she has worked with the village Negro; has studied his problems and has helped in their solution. She is a careful student of social conditions, and brings long experience and rare ability to this new and important Baltimore work.

M. W. O.

## THE TREND

The October magazines were all but barren of good poems. September seems to have been a harvest month by comparison. Three September poems, by unfamiliar authors, are good illustrations of a growing tendency to turn for lyrical appeal from purely personal to humanitarian emotions:

### IN THE JUVENILE COURT

DOROTHEA MOORE in the *American Magazine*.

So very like the flower—the weed—  
So very like the flower. Indeed  
I'm wondering what God would say  
If I should throw the weed away.

This hard defiant pallid girl—  
Offensiveness in every curl  
Of her rough hair. O my dull eyes,  
Can you be reason hers are wise?

And when I bend beside the bed  
Where my girl lies so sheltered,  
How may I touch that tender face,  
Forgetting these—who need such grace?

\* \* \*

### THE FACTORIES

MARGARET WIDDEMER in *McClure's Magazine*

I have shut my little sister in from life and light  
(For a rose, for a ribbon, for a wreath across  
my hair),

I have made her restless feet still until the night,  
Locked from sweets of summer and from wild  
spring air:

I who ranged the meadow-lands, free from sun  
to sun,

Free to sing and pull the buds and watch the  
far wings fly,

I have bound my sister till her playing-time is  
done—

Oh, my little sister, was it I?—was it I?

I have robbed my sister of her day of maidenhood  
(For a robe, for a feather, for a trinket's  
restless spark),

Shut from Love till dusk shall fall, how shall  
she know good,

How shall she pass scatheless through the sin-  
nit dark?

I who could be innocent, I who could be gay,  
I who could have love and mirth before the  
light went by,

I have put my sister in her mating-time away—  
Sister, my young sister—was it I?—was it I?

I have robbed my sister of the lips against her  
breast

(For a coin, for the weaving of my children's  
lace and lawn),

Courtesy Frederick Keppel and Co.

### WHISTLER'S AN UNSAFE TENEMENT.

The great etcher caught something deeper than the picturesque in this example of the rural housing problem in France a generation ago.

Feet that pace beside the loom, hands that cannot  
rest:

How can she know motherhood, whose strength  
is gone?

I who took no heed of her, starved and labor-  
worn,

I against whose placid heart my sleepy gold-  
heads lie,

Round my path they cry to me, little souls un-  
born—

God of Life—Creator! It was I! It was I!

\* \* \*

### TO THOSE ASLEEP

FLORENCE CROSS KITCHELT in the *Twentieth Century*

Before I slept it was the last I heard—  
Oh, let me tell you, not the song of bird,  
Nor thin wind playing in its harp of trees,  
Nor hush of folding flowers and nodding leaves.

Before I slept it was the last I heard—  
Oh, not the harmony of raining stirred  
The stillness of the midnight, nor the feet  
Of passing men—the city seemed asleep.

Before I slept it was the last I heard—  
Not sound of man, of rain, of wind, or bird.  
It was the cry of "News," a child's voice clear,  
A little bedless boy called "News, sir, here!"

It was the first in the dusk dawn I heard—  
The sound that brought the city's morn and  
stirred

The gray, volcanic quiet of the street—  
A child's cry, "News." He ran with tired feet.

### L'envoi

The human people came from out the doors;  
In haste they piled up perishable stores,  
And played at games of crossing right with  
wrong.

Oh, look, O God! The city sleeps so long!

## BOOKS

### HEALTH AND MEDICAL INSPECTION OF SCHOOL CHILDREN

By WALTER S. CORNELL, M.D. F. A. Davis Company. 614 pp. \$3.00; by mail of THE SURVEY \$3.20.

### THE DELINQUENT CHILD AND THE HOME

By SOPHONISBA P. BRECKINRIDGE, Ph.D., and EDITH ABBOTT, Ph.D., with introduction by Julia C. Lathrop, chief of the Federal Children's Bureau. Charities Publication Committee for the Russell Sage Foundation. 355 pp. \$2.00 postpaid.

### CHILD LABOR IN CITY STREETS

By EDWARD N. CLOPPER, Ph.D., secretary of National Child Labor Committee for Mississippi Valley. The Macmillan Company. 280 pp. \$1.25; by mail of THE SURVEY \$1.33.

### AMERICAN BAD BOYS IN THE MAKING

By A. H. STEWART, M.D. Herman Lechner. 241 pp. \$1.50; by mail of THE SURVEY \$1.60.

### THE BOY AND HIS GANG

By J. ADAMS PUFFER, director of Beacon Vocation Bureau, Boston. Houghton. Mifflin Company. 188 pp. \$1.00; by mail of THE SURVEY \$1.08.

### THE COMING GENERATION

By WILLIAM BYRON FORBUSH, Ph.D. D. Appleton & Company. 402 pp. \$1.50; by mail of THE SURVEY \$1.62.

Taken together, these six books are significant of the fact that this is indeed "the century of the child." The individual purposes of the books are diverse, but are really alike; namely, to help those who deal with children to understand them better and, in consequence, to furnish better social soil and nurture for growing our priceless human harvest.

Although it has special reference to children of school age, Dr. Cornell's book, *Health and Medical Inspection of School Children*, deals with all the common physical defects and diseases to which children are subject, and is of value to parents as well as to physicians and teachers, for whom it was primarily intended. It should be especially useful to those who, as members of boards of education, civic clubs and committees, are responsible for shaping and carrying out a community program in the interest of the health of children. It is a systematic "survey of medical practice as it relates to children of school age" and not "a review of the work of medical inspection in different localities," this last service having been well done by Gulick and Ayres.

In addition to a discussion of purely physical defects, problems of nutrition, contagious and infectious diseases, etc., there is also an extended chapter on Mental Deficiency. This should be read by all those who are responsible for the care of dependent and delinquent children, as their efforts are often futile because they do not detect cases of feeble-mindedness in their wards.

The book contains many suggestive charts and forms of report to be used by medical inspectors, nurses, teachers and others. The effort to provide abundant illustrations is commendable, and the subjects were evidently well chosen. The pictures, however, as printed are as a rule poor and, in some cases, for example, pages 142 and

384, so indistinct as to be practically meaningless.

Dr. Cornell is director of medical inspection in Philadelphia, and has based his discussion on his own examination of 35,000 children.

\* \* \*

*The Delinquent Child and the Home*, as its name implies, is a study not of the individual primarily, but of his relations to his home and other forms of social environment. It is based upon a study of all the data given in the records of the juvenile court of Chicago relating to the boys and girls brought into the court as delinquents during the ten years from July 1, 1899 (when the court opened), to June 30, 1909; and upon the further intensive study of the history of those boys and girls who were brought into court in 1903 and 1904. In this intensive study parents, teachers, employers, probation officers and other persons were interviewed, so far as they could be reached, to find out all possible supplementary facts about the children who were in court five and six years before. A revelation of the extent to which juvenile delinquency is inextricably bound up with, not to say caused by, home and other forms of social environment is made in this masterly analysis. The titles of chapters three to eleven are of themselves suggestive of the range of the study and of its remarkable social significance:

The Child of the Immigrant: The Problem of Adjustment.

The Poor Child: The Problem of Poverty.

The Orphan and the Homeless Child: The Problem of Misfortune.

The Child from the Degraded Home: The Problem of Degeneracy.

The Child from the Crowded Home: The Problem of Confusion.

The Ignorant Child: The Problem of the School.

The Child without Play: The Problem of Neighborhood Neglect.

The Child from the Comfortable Home: The Problem of the Unmanageable Boy.

The Court and the Delinquent Family: Some Aspects of the Problem of Treatment.

The authors do not use facts to bolster up any ready-made theories; but the facts are so marshalled and presented as to tell their own vivid story. In addition to the summarized information about all the children included in the study, there are also printed "family paragraphs" giving in outline the story of one hundred delinquent boys and fifty delinquent girls.

Never before has a great city had held up to it so clear a mirror of the conditions under which its unfortunate children develop waywardness. In thus presenting the facts in the social environment of the children of the Chicago juvenile

court, the service of the court as a social institution is also thrown into clear relief. The court can help to reveal the conditions that cause delinquency. At its best it can also place some children in new situations and under such new influences, personal, institutional and other, that delinquent tendencies may be checked and social possibilities be developed. But the court can never be anything but a means to an end. What the child needs in body, mind and spirit should be given to him at once. If he is compelled to go through the juvenile court before he can have these hungers of his divine human nature satisfied, the delay is just so much lost time to him.

As Julia C. Lathrop says in the introduction to the volume: "But the great and memorable fact must remain, that all children need for successful rearing the same conditions: homes of physical and moral decency, fresh air, education, recreation, the fond care of wise fathers and mothers. These essentials curtailed at any point, the degree of human wastage grows with the curtailment. No institution, no probation system, no orders of court, can instantly produce from chaos these essentials."

Meanwhile it is the duty of all juvenile court workers to understand the children who come to them who have thus far failed to get the full human chance that belongs to them and, so far as possible, to secure for them their delayed inheritance.

In the appendix Judge Julian W. Mack discusses the Legal Problems Involved in the Establishment of the Juvenile Court, Judge Merritt W. Pinckney contributes detailed testimony as to the history, methods and practice of the Chicago court, and Grace Abbott presents an Abstract of Juvenile Court Laws.

Altogether this is the one book that every efficient juvenile court worker must read and reread.

\* \* \*

Mr. Clopper's book supplements the *Delinquent Child and the Home* admirably. He presents the conditions of labor in the city streets that make not only for juvenile delinquency but for stunted physical development as well. Men and women have rhythms of interest and effort for different causes. Surely it is time that the street trades be given their "innings." Mr. Clopper has presented the leading facts about newsboys, bootblacks, peddlers, market children, messengers, errand and delivery children. He has also discussed the effects of these forms of work upon children, the tendency to develop delinquency, and the struggle for regulation in the United States and in Europe. A valuable bibliography and suggestive samples of badges, blanks, etc., are presented.

\* \* \*

Dr. Stewart approaches his discussion of the problem of the bad boy from a long and sympathetic acquaintance with prison residents, both adult and juvenile, some five hundred of whom he says he traced to their individual homes. His testimony leads in the two directions of better

reformatory, prisons and institutions for both adult and juvenile delinquents and toward such preventive measures as will lessen the volume of delinquency at its source. He says: "The story of delinquency, therefore, is in a great measure the story of indifference and neglect, whether it be in the palace of the rich or the hovel of the poor." The reader will rarely find himself out of harmony with the spirit of this book, but will frequently question the accuracy of the author's sweeping percentage statements.

\* \* \*

In *The Boy and His Gang* Mr. Puffer has made a little book of great value. His facts are stated at first hand in the first five chapters. In the remaining eight chapters he presents a discussion of these facts which is of rare pedagogical significance.

These chapters should be read by as many intelligent parents of boys of the gang age, and by as many teachers who deal with boys of this age, as possible. The secret of the way to harness and direct the gang spirit of a boy is surely of no less importance than the secret of the way to chain the lightning. Each secret seems simple enough when those who know how explain how to do it. The question for us is, in the case of the boy at least, can we do the trick ourselves? It's worth trying.

\* \* \*

It remains for Dr. Forbush to speak especially to parents. Each of the other books has a particular message to some one or more groups of our people. *The Coming Generation* is primarily an appeal to fathers and mothers. If these fathers and mothers are also social workers, teachers, legislators, administrators of business or law, so much the better. But his appeal is to men and women as parents. The whole range of preventive and constructive agencies in behalf of children is passed in review and the reader is made to feel that we can together make a world fit for our children to be born and grow up in.

I know of no finer picture of what a home may be than the author has almost unconsciously drawn in chapter V—*Books and Firelight and Children's Faces*. When the day dawns that finds every child in such a home the doors of the juvenile court may remain closed most of the day and *The Delinquent Child and the Home* may be allowed to gather dust upon the shelf.

HENRY W. THURSTON.

MORRIS LOEB

This is not the time to write calmly and dispassionately of Morris Loeb. The wound caused by his untimely death is still too raw, for those who knew him well, to do other than protest and rebel. In the chaos of conflicting emotions, occasioned by the knowledge of his absence from our councils, it is difficult to find the proper perspective of the things for which he stood and for which he incessantly strove.

Others may tell of his keen, analytic mind, of his scientific ability, of his wonderful grasp of communal problems. To me, the wonder has always been that with all of these distinguishing attributes, he was essentially human. Reared in luxury, every fiber of his make-up was democratic. He knew no distinctions of race, creed or color. Wealth was to him an instrument to use wisely for the benefit of others. Men and women, to him, were men and women—some better circumstanced than others by inheritance or good fortune—but in the last analysis men and women. He believed in the words of Kipling: "For the Colonel's lady and Judy O'Grady are sisters under their skins."

Is there a lesson for social workers in Morris Loeb's life? I think there is. It is told in the story above related—self-effacement. To quote Kipling again, "There was no ego in his cosmos." What he did, and his works are legion, was done under the compulsion of an overmastering sense

of duty. None of it was attempted with any thought of personal gain or advantage. He did not desire office—in fact, dreaded it. And yet his sterling sense of responsibility, his conception of the stewardship imposed upon him by his position and wealth, compelled him to accept many official positions which made deep drafts on his time and thought. I never knew him to wish recognition for himself. Unobtrusively, modestly, at times almost diffidently, he followed the dictates of his democratic ideals, and gave his time, his thought, his wealth and himself to the service of human kind.

Is there a lesson in Morris Loeb's life for the New York community? I think there is. The day will come, and I believe in short order, when the unwisdom of certain of our philanthropic methods will be realized and the methods themselves discarded. Morris Loeb advocated, one might almost say invented, the "federation idea" for charitable institutions and societies, because with his clear, almost prophetic insight, he saw the time ahead when the test of efficiency would be applied to philanthropy as well as to business. To him the "federation idea" meant more than a financial collection agency. He realized years ago that competition in charity meant waste; that the best results could be obtained only through co-operation. In his scheme of "federation" increased revenues were but a minor aim. The larger and the broader purpose was the co-ordination of the philanthropic resources of the community so that all of its pressing charitable and civic needs might be properly and adequately met.

Morris Loeb needs no monument of stone or bronze to perpetuate his memory. If memorial of some kind be desired, what better one could be imagined than the realization of his life's dream—the "federation" of the Jewish Charities of New York. If this be accomplished, those of us who are groping blindly through the shock of his death may begin to understand that perhaps there was some providential purpose in his too early demise.

LEE K. FRANKEL.

\* \* \*

Samuel Macauley Jackson, vice-president of the Charity Organization Society of New York, was born sixty-one years ago in the same city in which he spent so much of his time as a quiet, scholarly, philanthropic and useful worker among his fellow citizens. A graduate of the College of the City of New York and of the Union Theological Seminary, he added to these courses a year or two at Princeton and two years abroad. From 1876 to 1880 he was pastor of a Presbyterian church in Norwood, N. J. Fifteen years later he became professor of church history in New York University, continuing in that position until his death. In the quiet of his study on Waverly Place his busy

pen added valuable articles to various Bible dictionaries and encyclopaedias, as well as to the Universal Cyclopaedia and the religious parts of the new International. He also wrote much on Zwingli and the Huguenots. His work was marked by painstaking and accurate scholarship, for the big conscience which compelled him to devote so much of his time to the betterment of society, though his beloved books called so loudly to him, found equal gratification in giving to the world of scholars trustworthy information about religious themes which lay so near his heart.

As a reformer Dr. Jackson was the still small voice, not the whirlwind. Away back in 1885 he joined the district committee of the Charity Organization Society, serving in various capacities until his death, at which time he had been vice-president for nine years. Impressed with the close relation between crime and poverty he became a director of the Prison Association of New York, where his sane suggestions and helpful work were of great value. Few men realize as he did how necessary it is, if we would secure any real reform in prison work, to educate the public. The Prison Association had within its walls one of the best penological libraries in the country, but it was of little value for reference as no skilled librarian had classified the contents. Largely owing to his initiative and to his generous financial support, the books are now available for students, who use them constantly.

But the interests of Dr. Jackson were not confined to his own country. He was also the president of the board of trustees of a Christian college in Canton, China, and the work of missionaries throughout the world appealed to him. His studies took him abroad frequently and his quiet enjoyment of European experiences was an always welcome story to his friends. There, as everywhere, he was the gentle scholar.

The words used by Dr. Jackson on the death of his friend, Mr. Barrows, may well be applied to this faithful man: "He pleaded the cause of the prisoner because he was a lover of man and counted those members of the human family who had broken the social contract as still worthy of human treatment and of every effort to regain them to society, to win them back to the path of duty. . . . He overflowed with sympathy and appreciation. His presence was always cheery. There was in him a mighty tide of joy and peace because he lived an unselfish life, and only those who live for others get the best out of life."

The various societies and clubs to which Dr. Jackson belonged have paid him tributes of respect and affection, none simpler or truer than that of the Central Council of the Charity Organization Society: "Quiet and unassuming but forceful in his faithful performance of every duty, he endeared himself to all with whom he came in contact and leaves a multitude of friends to mourn his loss."

ISABEL C. BARROWS.

October 26, 1912.

SEA BREEZE TWENTY YEARS AGO

MRS. ESSIE CLARK

It was in November, 1887, that Mrs. Essie Clark became a visitor for the New York Association for Improving the Condition of the Poor so that her death this fall has cut off what was practically a quarter century of service. She was reception agent for the association throughout the greater part

of this period, and to her desk hundreds of those in need came each week, so that her fellow workers feel that it is not an over statement to say that she had come in contact with more sufferers from poverty and sickness than any other social worker in the country.

Although she had been a woman of unusual vigor, her strength began to fail two years ago after a serious illness; and yet, in spite of much suffering, she clung to her task and each day found her at her post. To quote an associate, "She loved her work, she loved the men, women and children who came to her for help and counsel, and she brought to her work unusual power of discernment, keen understanding of human na-

ture, warm sympathy and a strong sense of justice. Her searching glance gave discomfort to any who tried to deceive her, but those in real distress knew that they could rely on her quick sympathy and sound advice."

Her fellow workers all looked to Mrs. Clark constantly for help and encouragement, so much so that someone aptly called her "the staff mother."

At the close of the Spanish war, she served for two years as almoner of the Seventy-first New York Regiment, but perhaps the most distinctive feature of her long service was the part she took in organizing the earliest fresh air work of the association, for several years conducting the parties to the original Sea Breeze of twenty years ago.

R. FULTON CUTTING.

\* \* \*

Two years of excellent social service in a city department is the record of Raymond V. Fosdick, formerly commissioner of accounts in New York. In that brief period he moulded an office created primarily to make a detailed examination of money received and expended by the various city departments, into a great social agency. Some of the investigations made may not have been within the anticipated scope of the law, but, as Fosdick says in his curt, business-like way "the work had to be done, and we did it."

Under Fosdick the commissioner of accounts has performed the kind of work that the Bureau

of Municipal Research was organized to do. With enlarged powers, a capable force, and a head like Fosdick, the commissioners of accounts, popularly known as the "mayor's eye" would be still more valuable watch-dogs for the city government. Here are some of the highways into which Commissioner Fosdick carried his investigations in two years of administration:

- Billboard advertising.
- Sanitary condition of bakeries.
- Methods and practices of the Board of Elections.
- Moving-picture shows.
- Loan sharks.
- Penal and correctional institutions.
- Bail bonds.

Fosdick is only thirty years old. His social vision was not fully awakened until he met Lillian D. Wald of the New York Nurses' Settlement six years ago. Born in Buffalo of a family of school teachers, he looked forward to teaching himself. After attending Colgate University for two years, he completed his course at Princeton. Fosdick then made plans to attend Heidelberg. Instead, he met Miss Wald. She interested him in her work at the Henry Street Settlement. He went there to live and did club work while studying law.

Through a Princeton acquaintance he met George B. McClellan, then mayor of New York and also a Princeton graduate. Mayor McClellan offered him a position in the office of the commissioner of accounts. John Purroy Mitchell, a young lawyer just out of college, tall, lanky, keen and ambitious, was then rapidly building a reputation through his direction of this long dormant municipal agency of investigation. They "pulled together" well and Fosdick became Mitchell's chief aide.

With the coming in of the Gaynor administration Mitchell became president of the board of aldermen. Fosdick was urged for secretary of the Board of Estimate. The mayor instead appointed him commissioner of accounts, gave him a free hand and encouraged him to extend the field of action of the office, so as to make it a social engine. Recently a tighter rein has been drawn. This, Fosdick's friends believe, is in part responsible for his resignation.

Though he has given up public life to become vice-president of an automobile company in Detroit, he still longs for social and public service. In six months he expects to establish a New York office for the company and will then actively interest himself in his "hobby," the running of the government of this great city from a social point of view.

"It is the business of government," says Fosdick, "to do what needs to be done for the people. It is a great social engine. We now spend over \$30,000,000 of the city's money each year for the moral and physical welfare of the people in ways which, a few years ago, would have been considered paternalistic."

Although he has seen the worst side of men in public office and has delved to the bottom of many scandals, he believes that politics is constantly growing better and that the type of man

RAYMOND V. FOSDICK

in public office, from the highest to the lowest, is improving. Social vision is needed in politics. That there is a place for the social worker in city machinery is proved by Fosdick's stewardship of the office of commissioner of accounts.

LOUIS H. PINK.

\* \* \*

The new head of the Executive Department of the Cleveland Board of Education, Frank G. Hogen, has made one change which will be watched by educators everywhere. He has combined medical inspection and the department of physical education under one head.

Mr. Hogen selected for this position, E. A. Peterson, M.D., for two years head resident of Goodrich House, Cleveland, and well known to social workers throughout the United States, especially to workers in playgrounds and university athletics.

A Cleveland paper, referring to the appointment, said: "Dr. Peterson is a teacher, athlete, playground expert, physical training instructor, physician, social settlement worker, and now guardian of the health of 70,000 public school children." Dr. Peterson has shown an appreciation of the importance of his work which he describes as the co-ordination of "all other educational departments with the work of medical inspection, so as to turn out boys and girls from the public schools who know how to take care of themselves in the most hygienic way."

The work will be carried on under the general head of the Department of School Health and Development, but the director's aids will be assigned work in the specific departments of medical inspection, school nursing, instruction in hygiene and physiology, physical training, recreation and play and school sanitation.

To perfect the work Dr. Peterson has had assigned to him twelve men and eighteen women experienced in physical education, one tuberculosis expert, one alienist, one oculist, one expert in the Binet test, twelve doctors and eighteen nurses.

DR. E. A. PETERSON

Since Boston is the only other city caring for the health of its children in this comprehensive way, the public at large will watch this newer experiment with interest.

\* \* \*

Charles F. Weller, first secretary of the Pittsburgh Associated Charities, has accepted the position of associate secretary of the Playground and Recreation Association of America. Mr. Weller was one of the group of men and women who organized the national movement in 1906 and has always been particularly interested in the leisure time problem. While secretary of the Washington Associated Charities, Mr. Weller organized neighborhood recreation work in that city and was instrumental in bringing the first recreation supervisor to Washington.

A number of additions to the staff of the Playground and Recreation Association of America have been made within the last two years. Rowland Haynes, who is field secretary for the central district, has held teaching positions at Columbia University, University of Chicago and University of Minnesota. Francis R. North, field secretary for New England, has had a wide experience in Y. M. C. A. work and also in educational fields. L. H. Weir, field secretary for the Pacific Coast, has served as assistant secretary of the Associated Charities of Cincinnati, and was for five years chief probation officer of the juvenile court of Hamilton County, Cincinnati. Julia Schoenfeld, formerly associated with Mrs. Charles H. Israels in the study of dance halls in New York, is doing field work in Canada. J. C. Boyers, formerly with the Brooklyn Children's Aid Society, is now assistant secretary of the association. James Edward Rogers, a graduate of the University of California, who has been in educational work, is assistant field secretary for the Pacific Coast. Bertha Freeman, formerly with the Boston Associated Charities, is engaged in field work in rural communities. The additions include also Grace Cary, formerly with the Maine

Children's Home Society and later with the Maine State School for Girls; Abbie Condit, formerly with the Boston Children's Aid Society; Alla A. Libbey, formerly a neighborhood worker in Lewiston, Maine.

For the past two years under the leadership of Joseph Lee the association has been concentrating its energy on field work, helping cities to secure recreation secretaries, assisting in finding men and women for these positions, and trying to help organize public opinion in the various communities so that the work of the recreation secretaries is properly supported. During the last year New York, Milwaukee, Grand Rapids, Louisville, Worcester, New Orleans, Youngstown, and other cities have secured recreation secretaries. So small a place as Bennington, Vt., with a population of 8,698, has found it wise economy to secure such a secretary.

\* \* \*

Genevieve Beavers, who for four years has been with the New York Bureau of Municipal Research and the Robert L. Stevens Fund for municipal research in Hoboken, has become the executive secretary of the National League for the Civic Education of Women. Miss Beavers plans to make her organization a center to which women's clubs throughout the city can turn for suggestions and advice in civic work.

\* \* \*

Abbot Augustus Low, a brother of Seth Low, the second mayor of Greater New York, died September 25. Mr. Low was prominent in charity work in the Borough of Brooklyn, and was for years president of the Brooklyn Association for the Improvement of the Condition of the Poor, a trustee of the Brooklyn Institute of Arts and Sciences and of the Church Charity Foundation.

\* \* \*

E. S. Kavanagh, recently with the advertising department of Colgate & Co., New York, has been appointed financial secretary of the Cleveland Associated Charities. This position was made vacant by the resignation of Harry G. Hoak, who came into the field of social work seven years ago, also from a business occupation. For several months previous to his work with Colgate & Co. Mr. Kavanagh was employed by the New York State Charities Aid Association as a demonstrator of a tuberculosis exhibit that was sent to villages and towns in Jefferson and Niagara counties.

#### A QUESTION

ALICE SIMKINS IN THE BOSTON COMMON

You give of your name, your time, your *poet*,  
To ease your brother's woe;  
But what do you give of your own self,  
To pay the debt you owe?

You open a home for helpless ones,  
And shut them in with care;  
Of light and of love that your life knows,  
What think you is their share?

You talk, and you write; you organize;  
All this we know is true;  
But how do you spread the spark divine,  
The deep-down soul of you?

## CALENDAR OF CONFERENCES

### NOVEMBER CONFERENCES

- CHARITIES AND CORRECTION**, Iowa State Conference of Cedar Rapids, Nov. 17-19. Gen'l. Sec'y.-Treas., J. L. Gillin, Iowa City.
- CHARITIES AND CORRECTION**, New York State Conference of Syracuse, Nov. 19-21. Sec'y., Wm. J. Doherty, 105 E. 22d St., New York.
- CHARITIES AND CORRECTION**, South Carolina State Conference of Greenville, Nov. 12-14. President, Rev. A. T. Jamison, Greenwood.
- CIVIC ASSOCIATION**, American, Baltimore, Nov. 19-22. Sec'y., Richard B. Watrous, Union Trust Building Washington, D. C.
- IMMIGRATION, LAND AND LABOR OFFICIALS**, Second National Conference of Chicago, November 14-15. Exec.-Sec'y., James Mullenbach, 127 N. Dearborn St., Chicago.
- MUNICIPAL IMPROVEMENTS**, American Society of, Dallas, Texas, Nov. 12-16. Sec'y., A. Prescott Folwell, 50 Union Square, New York.
- PRISON ASSOCIATION**, American, Baltimore, Md., Nov. 9-14. Sec'y., Joseph Byers, 13 Central Ave., Newark.
- PROBATION OFFICERS**, Fifth New York State Conference of Syracuse, Nov. 19-20. Sec'y., Arthur W. Towne, State Probation Commission, Albany.

### LATER MEETINGS INTERNATIONAL

- BLIND**, Fourth Triennial International Conference on the, London, England, 1914; probably July 20. Sec'y., Henry Stainsby, 206 Great Portland St., London, W.
- CHILDREN'S WELFARE**, International Congress for, Amsterdam, Netherlands, 1914. President, Dr. Treub, Huygenstraat 106, Amsterdam.
- PRISON CONGRESS**, Quinquennial, London, Eng., 1915. Sec'y., F. Simon Van der Aa, Groningen, Holland.
- RELIEF**, Committee on Public and Private, London, Eng.
- SCHOOL HYGIENE**, Fourth International Congress on, Buffalo, N. Y., Aug. 25-30, 1913. Sec'y.-Gen., Dr. Thomas A. Storey, College of the City of New York.
- UNEMPLOYMENT**, International Association for Fight Against, Ghent, Belgium, 1913. American Corres. Officer, John B. Andrews, 1 Madison Ave., New York.

### NATIONAL

- COSMOPOLITAN CLUBS**, Association of, University of Pennsylvania, Philadelphia, December, 1912. Sec'y., Louis P. Lochner, 612 S. Brearly St., Madison, Wis.
- FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA**, Second Quadrennial of Chicago, Dec. 4-10. Sec'y., Rev. Charles S. Macfarland, 215 Fourth Ave., New York.
- HOUSING**, Second National Conference on, Philadelphia, Pa., Dec. 4-6. Sec'y., Lawrence Veiller, 105 E. 22d St., New York.
- INDUSTRIAL EDUCATION**, National Society for Promotion of, Philadelphia, Dec. 5-7. Sec'y., C. A. Prosser, 105 E. 22nd St., New York.
- LABOR LEGISLATION**, American Association for, Sixth Annual Meeting of, Boston, December, 1912. Sec'y., John B. Andrews, 1 Madison Ave., New York.
- RED CROSS**, The American, Washington, D. C., December. Sec'y., Charles L. Magee, Washington, D. C.
- YOUNG WOMEN'S CHRISTIAN ASSOCIATION** of the United States of America, 4th Biennial Convention of, Richmond, Va., Apr. 9-15, 1913. Gen. Sec'y., Mabel Gratty, 600 Lexington Ave., New York.

### STATE AND LOCAL

- BAPTIST CONVENTION**, NORTHERN, Detroit, Mich., May, 1913. Cor.-Sec'y., Rev. W. C. Bitting, St. Louis, Mo.
- CHARITIES AND CORRECTION**, Maryland State Conference of, Baltimore, Dec. 8-5. Gen. Sec'y., H. Wirt Steele, 15 E. Pleasant St., Baltimore, Md.
- CHARITIES AND CORRECTION**, Ohio State Conference of, Akron, O., Oct. 1913. Sec'y., H. H. Shirer, 1010 Hartman Bldg., Columbus, O.

*"In the hope that we may come to see more clearly the right values among us, and that, seeing them, we may come to use them better."*

## THE NEW INDUSTRIAL DAY

BY WILLIAM C. REDFIELD  
Congressman from the Fifth New York District

Sane and constructive discussion of the new scientific management, the rise in human values, and kindred economic questions.

A book which attacks the very root of the high cost of living, and deals with the fundamental laws of sociological uplift.

**A Book for Every Citizen**

Price \$1.25 net, postage 12 cents.

Published by  
**THE CENTURY CO.**

## Classified Advertisements

Advertising rates are: Hotels and Resorts, Apartments, Tours and Travel, Real Estate, twenty cents per line.

"Want" advertisements under the various headings, "Situations Wanted," "Help Wanted," etc., five cents each word or initial, including the address, for each insertion. Address Advertising Department, The Survey, 105 East 22d Street, New York City.

### HELP WANTED

A CHARITY Organization Society in a city of 80,000, fourteen miles from New York, desires a trained worker to assist with case work. Further information will be given upon inquiry. Address, giving experience and references, N. L. S., C/o THE SURVEY.

### SITUATIONS WANTED

A DOMESTIC science graduate with practical experience in hospitals and institutions, desires position as dietitian or matron. Address Miss M. M. J. c/o Mrs. L. F. Ford, 105 East 22nd St.

EXPERIENCED worker desires position as Assistant Headworker, musical, ten years in Girls' Club work. Would take smaller position. Address 1064, SURVEY.

EDUCATED woman, interested in sociology, seeks secretaryship or responsible office position. Experienced stenographer, correspondent; understands office management, proof-reading, compiling. B., 103 West 87th street.

### PUBLICATIONS

"Religion and Social Reform." A Unitarian pamphlet sent free on application to the First Church in Boston, 64 Marlborough St., Boston, Mass.

### PHILANTHROPY AND PUBLIC OPINION.

The annual reports of Charities Publication Committee, Nos. 1 and 2, dated December, 1907, and September, 1908, are needed to complete the file in the public library of the New York School of Philanthropy. Copies from subscribers who have no further use for them will be gratefully received. 105 East 22d Street, New York city.

## THE COMMON WELFARE

**WAR! WAR! WAR! WAR!**  
**BULGAR AND SERB AND GREEK!**

The minute men of a new epoch are mobilizing among us.

Through the streets of New York patriots of three Balkan nations are marching to the front, well nigh 30,000 strong. Some are already in their regimentals, the khaki they will wear in the field, but most of them are still in clothes which bear the stains of factory, mine or smelter. All but a small percentage of them are industrial workers.

From the centers of these industries of the unskilled foreign worker comes the report that more than one shop has been half crippled by the dropping out of its labor force. No wonder, for one party of Bulgarians alone from Gary, Ind., numbered almost 200; from the smelters of Butte, Mont., came a band of 200 Serbs; from the mines and furnaces of Bisbey and Globe, Ariz., a body of 200 more, and from San Francisco another Serb group of 150. From the nearer port of Providence 1,500 Greeks, most of them from New England textile towns, are said to have sailed. Many other workers have sailed from Boston, Philadelphia and Baltimore. From East and West bands are still on the way, and unrecorded numbers have gone singly.

One Greek line alone has already carried, partly in chartered boats, 9,000 souls, against a record of 1,800 in the same two weeks last year. Greeks, who have settled in the United States in the greatest numbers, make up about two-thirds of these emigrants. Perhaps 10,000 are Bulgarians and Serbs (Montenegrins and Servians)

in about equal numbers. A substantial minority are volunteers, but the majority are reservists, the Balkan countries having a system of conscription which puts a man on the reserve list until he is thirty-five. Thus these are men in the prime of life who, since their national papers published the call for reserves in the middle of October, have been on the march away from industrialism to medievalism; from modern America to such a war with the Turks as western Europe knew in the days of the crusades.

What are these men leaving in America? Large numbers are leaving nothing more substantial than a wire cot in boarding boss's establishment. They are foot loose of ties in this country, while from the Balkans comes the call of both home and patriotism. Leaders among them claim that the Balkan coalition against Turkey alone among European wars is no "great illusion" to the working people who bear its brunt. Their folk are oppressed by Turkey, and have something to gain, and not simply everything to lose, by war.

Of the three groups of reservists the Bulgarians appear to have least to hold them here and most to draw them home. They are very recent immigrants and almost none have families in America; most of them appear to be men in the thirties who have wives and children at home. But these men are not bound for home. They are going to Sofia, thence to the front, and thence?—they shrug their shoulders. They are the class of men, preeminently, who came to America only to earn and save for the family at home. Yet out of their savings each is pay-

*H. J. Mayer in New York Times.*

GONE ARE THE GREEK SLAVES TO SEEK THEIR LIBERTY

ing his way back, and many are giving a contribution to the Red Cross.

Next come the Serbs. A very liberal estimate gives 10 per cent of the Servian emigrants as having families in America. A large proportion appear to be young men, unmarried, but a rough estimate gives about half as men with families in the Balkans. These men, too, together with others of their race who cannot accompany them, have been, judged by their poverty, recklessly generous to the Red Cross war chest. The 200 Serbs from Bisbey and Globe brought with them \$9,000 collected in their mining settlements; the California group brought more than \$1,000, and every band has provided for itself and more. Of the 10 per cent who have families in America, a handful are taking the risk of taking their young children with them. The rest are leaving wives and children to the care of neighbors of the same race in American mining camp, steel or textile town—a trust, this, larger than the gifts to the war chest and one which may mean tragedy and misery and lonesomeness unutterable.

The same is true of many of the Greeks. They have been longest in America and though the majority are probably wage-earners, many have small businesses of their own—confectionery or candy shops, fruit or bootblack stands—which have had to be sold out or cared for. In some cases, these are to be looked after, at least for the present, by the Panhellenic Union. This is a philanthropic and social organization, reputed to have a membership of 60,000 in America alone, whose patriotism, harking back

to the "glory that was Greece" is probably more intense and arrogant than that of any other nation in the world. Unlike the Bulgarians and Serbs, there are a considerable number of rich Greeks in America, and their contributions to the funds of the union are being spent to supplement the traveling expenses of those who have least and to care for the families of such young married men as to go to the front; the rest goes to the Red Cross.

A curious and interesting side-light on the Greeks in America is the fact that no small proportion of the married men are married to American women, and some of these are among the hundred women who have gone with their husbands to the seat of war to serve as nurses.

#### INDUSTRIAL AMERICA: A TOUR OF THE TRADES

From Arnold Bennett to Pierre Loti, America has been the stamping ground for a group of distinguished foreigners in recent months. But there has been one among them "whose United States" has been different from that of all the rest—as different from the ordinary tour of the European traveler among us as our brand new cities are different from the cathedral towns of the Rhine. His has been a tour of the great border land between work and health, of a frontier as full of hazards to life and limb as any the continental visitor of a century ago found on our western borders.

This visitor was Sir Thomas Oliver, M. D., the leading authority among English speaking peoples on occupational diseases—president of

the British Association for Labor Legislation, and author of the book *Dangerous Trades*, which has done more than any other volume in English type to revolutionize shop practice and court decrees. In one of the labor cases before the United States Supreme Court, which wrenched loose some of the most rigid inhibitions of the federal constitution with respect to the police power, *Dangerous Trades* was quoted not less than thirteen times in the brief for the people.

Dr. Oliver was one of the principal speakers at the recent Congress of Hygiene and Demography which met in Washington, and was prominent in the discussions in the section on industrial hygiene, reviewed on p. 152 by Dr. Hamilton. But even more interest attaches to the tour which he made while here among the mines and industrial plants of the United States.

The itinerary was mapped out by Frederick Hoffman, statistician of the Prudential Insurance Company of America, who proved a Baedeker, Cook, courier of the nth power. Probably no man in the country has as wide or intimate knowledge of industrial conditions from the standpoint of health as Mr. Hoffman. This has grown out of his years of study of morbidity in the different trades as a basis for the elaborate system of ratings which the Prudential Company has developed in writing industrial insurance: that is, insurance taken out on small, frequent payments by the workers themselves. Mr. Hoffman knows the sanitary problems of great belts of the plantation country of the South as no one else does but the physicians who live and work there all their lives. It is told of him that on his way across the continent, he may drop off at some small Iowa town and spend a day, learning from village storekeepers and the country doctor and from the look in the people's faces, things which, with his experienced eye, give meaning to the columns of figures in his statistical laboratory. But it is in the industrial field that his work has been perhaps most intensive. Weeks at a stretch are sometimes spent in one line of trade, so that every occupation, its hazards, the heat, the tension, strain, poisons, dust—the whole physical environment of every important post of the crew is known to him, and duly entered in his weighted tables. And out of it has grown his impelling aim to help lift the burden of disease and accident from American workers—an aim not merely for the sake of cutting down insurance costs, but one which has its roots in the scientific and humanitarian outlook which industrial Germany has given to a generation of leaders in production.

Months were spent by Mr. Hoffman in outlining the itinerary and in getting permission from heads of great corporations for this visitor from foreign shores. Not that the American manu-

SIR THOMAS OLIVER

facturer is afraid of a visitor from foreign shores; it is the expert from the foreign manufacturing plant that he is suspicious of, the tapping of inventions and methods which may give the American producer a foothold in the world markets. It was a case, however, where the spirit of science and humanitarianism triumphed over trade habits. Dr. Oliver visited plants where the newest fields of industry are forging outward—from breakfast foods to electricity; he went through the great works of the steel district and of the Niagara Falls area, where carborundum and all manner of things are made by dint of the great voltage of falling waters. But it is not merely in these new fields that occupational diseases are being recognized by scientist and engineer. Soup, paint, pottery, oils, watches, brass, lead, copper, hats, pearl buttons, cutlery—the manufacturing of every one of these has a problem of trade disease, when that delicate container of water and vital energy which we call the human body, is introduced as a factor in the team play of chemicals and machines and horsepower.

Dr. Oliver also visited some of the hospitals and universities where we in America are beginning to study these problems. Among the plants, mines and institutions visited were the following:

Waterside plant of the Edison Electric Co., New York.  
American Museum of Safety, New York.  
Rockefeller Institute of Medical Research, New York.  
St. Luke's Hospital, New York.  
The Campbell Soup Co.'s plant, Camden.  
Pennsylvania Hospital, Philadelphia.  
Johns Hopkins Hospital, Baltimore.  
Sherwin-Williams Co.'s paint factory, Newark.  
The Prudential Insurance Co. of America, Newark.  
Edison Storage Battery Co., West Orange.  
The Trenton Potteries, Trenton.  
New Jersey State Prison, Trenton.

Naval Academy, Annapolis.  
 Experiment Station of the Bureau of Mines, Pittsburg.  
 Plant of the National Lead and Oil Co., New Kensington, Pa.  
 Several mines of the Pittsburgh Coal Co., near Pittsburgh.  
 Several plants of the U. S. Steel Corporation, near Pittsburgh.  
 The Carborundum Co., Niagara Falls.  
 The Shredded Wheat Co., Niagara Falls.  
 Niagara Electro Chemical Co., and other plants, at Niagara Falls.  
 A prison farm near Toronto.  
 The Waltham Watch Co.'s factory, Waltham.  
 The Wood Mill of the American Woolen Co., Lawrence.  
 Plant of the Underwood Typewriter Co., Hartford.  
 The plants of the Bridgeport Brass Co., Bridgeport.  
 The plants of the National Lead Co., Perth Amboy.  
 The Electrolitic Copper Refinery of the Anaconda Copper Co., Perth Amboy.  
 The Dunlap Hat factory, Brooklyn.  
 Tonk's Pearl Button factory, Newark.  
 The New England Button Co.'s Ivory button factory, Newark.  
 The cutlery factory of J. Wiss & Sons, Newark.  
 The Tungsten lamp works of the Westinghouse Co., Bloomfield.  
 The plant of the American Bronze Powder Co., Verona, N. J.

A complimentary welcome dinner was tendered to the visitor by the American Museum of Safety, Arthur Williams, president, at the Union League Club. Dr. Oliver participated in the dinner of the Life Underwriters' Association of Buffalo, where he delivered an address on the British Insurance Act and workmen's compensation legislation. He also gave a lecture on Industrial Hygiene and Labor Legislation at Yale University. At Boston he was entertained at a dinner, arranged by John Koren, at the St. Botolph's Club, and a few days before sailing for home he was the guest of honor at a farewell dinner provided by the American Association for Labor Legislation, at the University Club, New York, Henry W. Farnam in the chair.

#### BENCH, DOCKET AND NURSERY

A rest room for women has been located in the City Hall, Chicago, adjoining the Court of Domestic Relations. In this bit of announcement there is a deal of human significance. It is a response to the cries of little children and the silent woes of motherhood.

It will be remembered that the Court of Domestic Relations was created so as to lift from the coarse ruck of minor court cases those which concern family troubles. The suggestion came from quick-hearted women that these be heard and decided in one court of domestic relations, and the men constituting the stern front of bench and bailiff fell in with the idea.

It followed that so many heart-rending scenes were thus brought together within the new court that within little more than a year they wore away the health and spirits of the first presiding judge. To their help and his, however, he brought into the service of the court a woman adviser, who now sees the people involved in every case before it comes to trial, and settles many a one out of court.

It was found that not a few of the women brought with them their children, because there was no one to look after them at home. There was no adequate waiting room, and the mothers were obliged to do the best they could with the little ones out in the corridors of the city hall. Their plight was observed by a committee of women and immediate steps were taken to relieve it. Last week a nursery and rest room was opened across the corridor from the courtroom with its judge on the bench, its jury in the box, its bailiff at the door—a real homelike nursery with a table full of toys, little cots, and tiny chairs, a living room for mothers and children, with the court's own nurse in charge, as real a court officer as the bailiff across the hall. The children are furnished with milk, and a light lunch if they are detained through the noon hour.

The courtroom was crowded by sympathetic folk the day of the opening, a crowd representing almost every class, in one way or another, in the city of Chicago. Some of its richest and some of its poorest sat side by side; humble workers among the poor and strong leaders of great causes; private citizens and public officials; Roman Catholic priests, Jewish Rabbis, Protestant ministers, were there. They recognized that here was something new in the ordinary course of law and order, and that the hand of women had given it its impulse, where neither the law books, nor the precedents, nor the imagination of men had seen the way. It was the first justice of the Municipal Court of Chicago who predicted a time when a woman would be the judge of the Court of Domestic Relations, and wished that he might some day so address Mrs. Bowen, president of the Chicago Juvenile Protective Association.

This step registers an advance in the treatment of the unfortunate, the neglected and the incompetent who come for redress to the Court of Domestic Relations. Looking for the next things to be added to the court equipment, one after another, the speakers, as by common consent, demanded not only the addition of such an expert psychopathic adviser, but also the creation of some country wide agency to pursue and return deserting husbands and fathers, an employment bureau in co-operation with the court, a reformatory farm where the prisoner can work for his family's support as well as his own while serving sentence. It is also planned in time to have in connection with the court a medical man and psychologist so that it may become, in the very best sense of the word, a laboratory where men and women will be kindly treated and scientifically studied, not for the purpose of punishment but to insure the prevention of crime and to promote vital welfare.

### MURDER IN THE FIRST DEGREE

EDWARD T. DEVINE

The law no longer presumes that Charles Becker, late lieutenant of police in the city of New York, is innocent of murder. His confessed agents and accomplices and his agents and accomplices who have not confessed but are about to be tried on the same charge are still presumed to be innocent; but, in his own case, the midnight which separated Thursday the twenty-fourth from Friday the twenty-fifth of October, marked the end of the pretense of suspended judgment and the passing of the slowly ripening opinion of the community into the solemn verdict of a court of justice.

The evidence had been heard and sifted; all legal rights and fictions had been carefully observed; furious efforts had been made to impeach the damning evidence of guilt; the judge, although obviously convinced himself of the prisoner's guilt, had scrupulously charged the jury on the one point on which there was any hope of acquittal, that the testimony of accomplices could not of itself convict, that there must be some independent corroboration, and that he was himself in doubt as to whether the particular witness on whom the state mainly relied for this corroboration was or was not an accomplice, although he must be assumed not to be; the lawyers for the defense had prudently exercised their acknowledged right to keep the prisoner himself mute in court so that he could not be questioned by the prosecuting attorney; for a long fortnight the game had been played out under the watchful eye of a stern and upright umpire; the game in which the life of a man and the good name of a police system were at stake; the game in which the verdict of the twelve good men and true—that Lieutenant Becker is guilty of murder in the first degree—only reflects a larger verdict of an aroused and convinced public opinion that the system of which he was a part, the system widely ramifying inside and outside the police department, the system which the Board of Aldermen is even now investigating, is guilty of crimes so sordid that dirty grafting is a phrase too nice for them, crimes so foul that ordinary murder in the first degree seems comparatively respectable.

It is altogether appropriate that this trial should have attracted world-wide attention; that dignity and scrupulous observance of judicial forms and traditions should have characterized it; that able counsel should have been at the

disposal of the accused man; and that the public should have remained as long as possible incredulous at the possibility of such a crime. For this was no ordinary murder. That was the charge in the indictment, but if we pierce beneath the overt act of which he was charged to the substance of his offense we discern that the accusation was not that an act of violence had been committed against an individual. The crime was in effect that of treason. The betrayal of a public trust in such a way as to undermine the very foundations of social order—this is what happens when an officer of high rank in the uniformed police, sworn to enforce the law, commissioned to prevent crime and to detect law-breakers, becomes himself a law-breaker, associates intimately with criminals not to restrain or reform them but to encourage and even to direct their crimes, shares in their stealings, and, when snared at last and in danger of exposure, deliberately hires assassins to kill the would-be informer in the brilliantly lighted streets of the very city which it was his sworn duty to protect, not neglecting to see to it that policemen do not arrest the murderers, his agents, on the spot, or interfere with their escape.

We are sorry that Herman Rosenthal was killed. Perhaps the information which he was trying to get to the district attorney would have laid bare the actual situation as clearly as do these public trials for murder; and, if so, two lives already spent, and others already apparently forfeit, might have been spared. It is a gruesome thing to take the lives even of gamblers, gunmen, murderers, and traitors. But for the taking of the life of Rosenthal there is at least this compensation, that it reveals in all its nakedness the sordid criminality of that alliance between corrupt policemen and professional crooks of which we have had far more suspicion than positive evidence.

It is as well that Becker should not have stopped, as other police officials are believed to stop, with protecting gamblers and pocketing a substantial part of their gains. It is as well that one man among the men who betray their trust should have waived all scruples, should have had the nerve and consistency to stop at nothing, not even at murder. For this murder was not a separate crime in itself, with an independent motive. It was but an incident in a consistent and consistently criminal career. The underlying motive was not hatred or revenge, but greed. The defect of character which led to it was not sudden passionate impulse but a hunger for unearned wealth. Putting out of the way a gambler who had become dangerous may be the untoward incident which will send him to the electric chair, but it scarcely adds perceptibly to the measure of his guilt. Others who are false to

their oath of office, false to their obligation to protect society, proprietors of gambling dens and disorderly houses, patrons and partners of crooks, one and all stand in his predicament; and if when put to the test they shrink from murder, as he did not, this may be not because they have more conscience, but because they have less courage.

The Becker trial brings home to us the whole ghastly connection between police grafting and payment for privilege, whether privilege to do wrong, as in this case, or as in many others merely to cover up some discreditable incident or to escape petty inconvenience. Under our criminal procedure the jury was very properly prevented from knowing anything about the prisoner's relation to this system of police protection for privileged criminals except what bore upon the specific charge. In the perspective of the larger case now before the jury of public opinion the murder of Rosenthal takes a minor place as one incident among many. Possibly the dismissal of Lieutenant Stanton from the Police Department after he had given testimony reflecting unfavorably upon the present administration may prove to be quite as important. The city must put its house in order and the work must be done from the foundation.

## WANTED: A NEW KIND OF SOCIAL WORKER

SIMON N. PATTEN

In a recent conversation a woman said:

"I wish there was some social work I could do. Mother will not let me go into a settlement," and besides, she added with a sigh, "I am more of a poet than a worker."

"If so," I replied, "you are the person I am looking for. One poet is worth a dozen social workers."

"What would you have a poet do?" she asked.

"Write a hymn."

"A hymn?" she repeated in evident astonishment. "There are lots of good ones. Why do you want more?"

"I do not want more of the kind we have," I replied. "They express the feelings of men in another age. Our emotions need expression and some poet must help us out."

I doubt if the young lady has the enthusiasm needed for the task. She is looking back, not ahead, for inspiration. But a social poet is wanted all the same. If those with a poetic temperament realized the opportunity now open, some one could hit a chord arousing a national response. When, however, I say this to friends, I find they are surprised rather than pleased. The thought of a social poet makes them smile;

hymns remind them of the revival methods they have long since discarded. And yet this step in social movements is just ahead. The present political campaign will be memorable for its telling phrases. Words that have been heard only in the classroom or in settlement conferences have suddenly become a part of the English language. Social thought and enthusiasm are now on the street.

A story is told of a man at a recent convention who turned to his neighbor and asked: What is this social justice they are talking about? The person addressed took time to tell what the phrase denoted. Before the convention closed he made a telling speech on social justice.

This was told as a joke illustrating how readily political converts are made. I do not see it in this light. Like thousands of others, the man had in his experience the data on which social justice depends. They had never been blended into unity so as to become effective. The new phrase converted isolated experience into emotional enthusiasm. He was thus enabled to use his oratorical power and become a leader instead of having to undergo a long apprenticeship.

The epoch of phrases does not carry social movements to their goal. Song is more effective than words. Conventions have this year risen in enthusiasm to the point where they broke forth in song, but the songs used were not effective for the end in view. There is dearth of social hymns. In the recent revision of a church hymnal, its authors looked far and wide to find material for such hymns. With all their good will the result is disappointing. Social hymns are yet to be written. I hope, however, social poets are already at hand, waiting merely for material and opportunity.

I write this, wondering if I am really alone in the feeling that poets as well as workers are needed in the cause of social justice. Are we to rely on argument and statistics or can we make an emotional appeal that will arouse as well as convince? I for one believe that poets are not born but are made by the events that inspire them. A recognized goal is as much an element in their success as with other workers. Every one has poetic feelings. Some have the power to put these feelings into appropriate words. What they need is direction and encouragement.

Do others share in this belief? If so, perhaps THE SURVEY would permit itself to become the medium through which a few kindred spirits might come in touch with each other. My thought is that some theme be set to see what responses come in.

What theme, fellow worker, would you suggest? Is your Utopia less plainly outlined and the road to it less clearly pictured than was the goal visualized by the prophets of old?

## II PULLMAN

PULLMAN. The very word seems like a pivot around which swings the range of our industrialism. For those who early hailed the town as providing that alchemy by which the labor problem was to be transmuted into Utopian paternalism, the mention of the name brings memories as of an Arabian Night's dream which vanished under the impact of reality. For "practical" men it signifies the futility of social betterment schemes and marks the battleground where law and order triumphed over anarchy—in the struggle of 1894 which, before it ended, embraced the transportation service of the country and saw the rise and fall of the American Railway Union under Eugene V. Debs. But for the host of warm-hearted, sane believers in the better day that is coming, it stands for a great human tragedy, yet a necessary one in so far as it made of paternalism a "lost cause."

In the perspective of the years we can understand the point of view and the disappointment of the strong man whose hopes and plans for a model industrial community were shattered even in the hour of his victory over his own men.'

'See A Modern Lear, by Jane Adams, p. 131.

And we can sympathize with the men who, having grievances at least in some degree just, went through the hard struggle to bitter defeat, yet in that hour knew not that their fight had sealed the fate of paternalism and left open but one road—the road toward industrial democracy.

Our concern in the Pullman of today is to find out what heritage—industrial, civic and social—the past has turned over to the present and the future. The Story of Pullman distributed at the Pullman exhibit at the World's Columbian Exposition, Chicago, 1893, declared that "At an early date the beautiful town of Pullman . . . will be as a bright and radiant little island in the midst of the great tumultuous sea of Chicago's population; a restful oasis in the wearying brick-and-mortar waste of an enormous city."

Today, twenty years later, it would seem worth while to make a voyage of re-discovery of this little "island" and see what it means in the sea of Chicago's life—in health, recreation, housing, and community spirit. Has Chicago been led to better dwellings by the model town? What of the provisions for wholesome play under paternalism and under public auspices? What of the

Arcade Park and the "Green Stone Church" as they appeared in the old days.

people themselves who live in Pullman? Does the industry continue to supply the old houses with dwellers? Have strange people come in who know nothing of the ancient glories of their habitation? What of work conditions to-day as compared with those of twenty years ago? You and I ride in steel instead of wooden cars; how does this affect the workmen who fashion them? Does our greater safety and comfort mean greater or less skill on their part? Did they find themselves, at the change, with useless trades on their hands? What significance is there in the fact that the only Socialist who ever sat as alderman in Chicago's city council came from the ward of which Pullman is a part, came indeed from a work bench in the Pullman car shops?

The old Pullman was the subject of countless radiant descriptions. The whole country watched the dream of its founder take form. In 1880 open prairie stretched westward from Lake Calumet, broken only by the small farming community of Roseland. Five years later, when the chiefs and commissioners of the various state labor bureaus visited the new town, they found the great car works surrounded by nearly 9000 dwellers in 1520 houses having 6,485 rooms. Every house and tenement was supplied with water and gas. The streets were wide, well built and clean, lined with beautiful lawns and trees, all cared for by the company. A complete system of drainage had been installed before the population came.

From the railroad station, fourteen miles from downtown Chicago, a broad boulevard, now 111th street, led eastward to Lake Calumet.

North of this boulevard were the great shops, a park and artificial lake forming an attractive landscape between them and the railway station. South of the boulevard and visible from the station were the hotel, the Arcade—containing stores, bank, theater and library—a park with gardens and a bandstand, and beyond it the Greenstone Church, the whole making a "civic center" which would do credit even to our modern town planning. A block south of the Arcade was the school building. Beyond this grouping of the more imposing buildings were a dozen city blocks of dwellings with a conveniently located market building. The nearer blocks contained the better houses, in solid rows, yet with some diversity of architecture, while the further blocks were given over to the cheaper tenement buildings which presented a monotonous similarity of exteriors and of interior arrangement. More blocks of dwellings occupied the tract immediately north of the shops. At the Lake Calumet terminus of the boulevard was a small island. Here the recreation field was laid out, and games of all sorts were encouraged. Crack cricket matches and the most famous rowing regattas of the middle west shared with baseball and bicycle races in bringing renown to the place as an athletic center.

But beneath this attractive picture of the "model town" was the spirit and substance of paternalism. A cardinal point in the policy of the president of the Pullman company was the retention of the ownership of land and houses. Maintenance of utilities, care of houses and lawns, repair and cleaning of streets, manage-

ment of hotel, theatre and other community activities—all were controlled by the company. Thus was established that autocratic power, which scarcely was challenged until 1885, when Professor Richard T. Ely assailed it as feudalistic. It is easy to criticize an autocrat, but even the social worker, who sometimes turns his imagination to the things he would do if he were mayor or president of a great industrial concern, little knows how subtly his own conviction as to "what is good for people" might estrange him from them when they failed to share the conviction. It is not hard to understand the jealous guidance Mr. Pullman sought to exercise over the activities of the town he so fondly created. The evident sincerity of his benevolent intentions blinded most of the early observers to the real significance of such enormous power over private affairs of life, and their descriptions consisted of unmixed praise.

In characterizing the president of the Pullman company as "the modern King Lear," Miss Addams, in her paper written just after the strike, shows how the honest desire to give his employes the best surroundings developed into a sense of pride and power in his own benevolence, how "he cultivated the great and noble impulses

JUST ARRIVED

His one response to inquiries in English was "Slovensk."

of the benefactor until the power of attaining a simple human relationship with his employes was gone from him." The story of Pullman, so far as its significance for today is concerned, centers largely in the developments whereby the feudalistic power was dislodged and shifted to the shoulders of the community. The annexation of Pullman to Chicago in 1889 was the beginning. The vigor with which the company opposed this step indicated a realizing sense that it foreshadowed the end of company control of the town.

The great strike was the next important factor in the disintegration of that control. The trouble centered in a situation involving fixed rents and sliding wage scales, both controlled by the company. The latter suffered in the general business depression following the World's

Fair. It claims to have accepted contracts at a loss in order to continue to afford work. But it cut its wage scales 22 per cent and reduced its schedules of working time. The men struck.

In the midst of the struggle a sympathetic strike was ordered by the new American Railway Union whose members crippled the railway service of the country by their refusal to handle Pullman cars. The action of President Cleve-

INSIDE THE WORKS

The advent of the steel car has almost revolutionized the industry.

land in sending federal troops to Chicago started a bitter controversy in which the governor of Illinois and local officials claimed that their control of the situation was adequate and that the President's action was unwarranted. The imprisonment of Eugene V. Debs, president of the American Railway Union, gave added sting to the defeat of the organization by the railway managers and undoubtedly helped to give Debs his leadership of the Socialist Party. The sympathetic strike and its attendant violence was widely condemned—the railroad brotherhoods, for example, refusing to take part in it. But the original and more orderly strike of the Pullman employes was based upon grievances in some measure just, in the estimation of nearly every investigator, from the government commission, headed by Carroll D. Wright, to an attorney for one of the railroads later involved, who is now identified with one of our largest industrial corporations. It was this strike that demonstrated how unsatisfactory the domination of community interests by the industrial authority could be if the form was kept up without the loyalty of both parties.

The third great event in the waning of this domination was the Illinois Supreme Court decision in 1898 to the effect that the charter of the Pullman company did not permit it to hold real estate beyond the necessities of its manufacturing business. Five years were allowed for disposing of these holdings, and at the end of that period an extension of five years was granted. By 1908, therefore, the possessions of the Pullman company were reduced to little more than the car shops. However, the remaining vacant land was retained by much the same interests. The Pullman Land Association was the agent by which this was accomplished, and of the 4,000 acres originally purchased, approximately 2,900 are still owned by this association. The shops occupy about 500 acres, and some 600 acres were sold. Hotel, market building, school, church—all passed out of the company's hands. To retain some remnant of the cherished project of her husband, Mrs. Pullman purchased the Arcade, which she still owns.

The change from company ownership and management to that of individuals and the public has meant a distinct gain in many respects, especially in provision of schools and recreation facilities and healthier community relationships. But nevertheless it has left the old town with a forlorn air of faded glory. The city of Chicago does not maintain the streets so well, and out of sheer regard for the immediate surroundings of the shops, the company still assumes the maintenance of 111th street—the boulevard—and the thoroughfare along the western front. The old lawns which made each street beautiful in the old days are kept up or

not as the present owners happen to care, and often adjoining premises show a glaring contrast. Hard, bare ground in front of the tenement blocks permits their ugly monotony to stand out today in all its nakedness, a monotony previously softened by the flanking greensward and hedges. These block houses, unsuitable for sale to the occupants of their tenements, were bought by Mr. Pullman's daughter, Mrs. Frank O. Lowden. Her agent rents them under the supervision of the same caretaker, or "house boss" as he is called, who has been employed since the beginning.

Except for these block houses and some of the cheaper rows of dwellings north of the shops, which are held by the Pullman Land Association, the houses of the town were offered to the occupants at prices averaging one hundred times the monthly rental. Easy terms of payment were arranged, on installments scarcely larger than rent, and some purchasers are still paying off the few remaining installments. The

"BLOCK HOUSES"

These cheaper tenements are today inhabited almost exclusively by Poles, Hungarians, Italians and Greeks.

number of employes who thus became owners of the houses which they and their families had come to call homes was gratifying to those whose hearts clung to the high hope in which the town was founded. Individual effort due to pride in home ownership has brightened the Pullman of today with an after-glow reflecting the earlier beauty. A Saturday afternoon stroll shows many a householder working to improve his own dwelling.

The substantial original construction of brick and the architectural scheme still give the houses of Pullman a distinct stamp in contrast with the stretches of dingy, frame houses characteristic of Chicago's poorer sections. They appear like a transplanted fragment of one of our eastern cities. Chicago's housing seems not to have been influenced in the slightest degree by the "model" on its outskirts. While Chicago has only recently come up to tenement light and air standards set by Pullman thirty years ago, that progress seems due to the country-wide advance in standards.

The block houses which contain the bulk of the cheapest tenements show the lowest conditions of living in the town of Pullman. Seven of these houses south of the shops contain 246 apartments: 36 of two rooms, 88 of three rooms, 98 of four rooms and 24 of five rooms. The rents vary from \$5 a month for two rooms to \$8 for four rooms, while some of the five-room tenements are \$10. While rents in general have risen, those at Pullman show very little actual change from the rates of thirty years ago. Then Pullman rents were considerably higher than tenement rents in Chicago, or in Massachusetts manufacturing towns, as the report of the labor commissioners showed. The accommodations were much superior, however. Now, for accommodations of even poorer grade in Chicago a rate of at least a third more must be paid.

THESE ARE BETTER

Though holding in general one family to a house, the monotony which gives the block houses the appearance of a penitentiary is not altogether lacking.

Sanitary conditions are not as bad as one usually finds in the cheaper of Chicago tenements. Each room has one or more windows giving adequate light and air. Practically none opens on a narrow court. A bath tub is a rarity, which seems strange in a "model town," but it must be remembered that the standards of 1880 were not those of today. Spasmodic overhauls of plumbing and sanitary conveniences in the block houses have kept them in a fair state of repair, though there is considerable complaint concerning dilapidation of sinks and odors from them, and renovation of walls might be more frequent. The scrubbing of hall floors is arranged for by the rather unusual method of apportioning the space equally among the families whose tenements are entered through the hall.

Crowding is doubtless more serious than formerly, though statistics on this score for the earlier days are difficult to find. The "house boss" of the block houses estimates that about 1,600 people now live in the 848 rooms of the 246 tenements above mentioned. This is an average of about six to a tenement and nearly two to a room. But a relief visitor considered

even this estimate of crowding as conservative, because of the secretiveness of the families as to the number of boarders they have. One case, for example, was cited of a husband and wife, eight children and two boarders—all in a tenement of two rooms. Not infrequently a large group of single men, usually Greeks, inhabits a tenement. That the problem of the boarder, however, is not a new one is indicated by a description of the town written in 1893 by the wife of an official. At that time it appeared that no fewer than 900 families in Pullman had one or more boarders or roomers, and that from 2,500 to 3,000 "bachelors" worked at Pullman. The work force at that time numbered fewer than 7,000.

This crowding cannot fail to be a menace, especially since the tenements in the block houses have little privacy with respect to toilet arrangements. The three tenements on each floor of an entry-way have their closets grouped at one end of the common hall.

To accommodate more people in a given space, some of the smaller houses seem to have gone through an evolution from single to two-family dwellings. For example, a whole block of exactly similar houses north of the shops, each formerly containing five rooms and renting for \$12, is now divided, so that each contains a two-room tenement down stairs, and a three-room tenement up stairs, each renting for about \$6.50. The appearance of the houses from the street remains unchanged, but the only entrance to the up-stairs tenements is through the rear alley and thence up a flight of wooden stairs from the back yard.

South European immigration displacing earlier comers from the North is responsible in some measure for the crowding and for many other changed conditions in the town. The influx of new nationalities is shown most strikingly by a comparison of tables giving the nativity of wage-earners in different years. In 1892 there were among the 6,324 wage-earners:

American born	1796	or about	28	per cent
Scandinavian	1422	"	22	"
German	824	"	13	"
British	796	"	12.5	"
Dutch	753	"	12	"
Irish	402	"	6	"
Polish	116	"	2	"
Italian	99	"	1.5	"
Bohemian	26	"	.4	"
Russian	12	"	.2	"
Hungarians and Austrians	77	"	1.2	"
Lithuanians	none			

There was but one Greek. The extent of the change which has come about in twenty years is vividly shown by the fact that within one week after the opening of the hostilities between Turkey and the Balkan states, no fewer than 200 out of an estimated 500 Greeks in the vicinity of Pullman started back to join the army

THE FRONT

Though monotonous in appearance, these houses seem to be one family dwellings, but from—

THE REAR

—the rear, each house is seen to have two tenements, the second story tenement being reached only through the rear alley.

of their fatherland. In 1912 out of 10,000 employees in the Pullman shops there were:

American and English born.	3151	or about	31.5	per cent.
Scandinavian .....	1628	"	16.	"
Hungarian .....	1412	"	14.	"
Italian .....	868	"	9.	"
German .....	707	"	7.	"
Polish .....	695	"	7.	"

Lithuanian .....	281	"	3.	"
Greek .....	229	"	2.	"
Bohemian .....	80	"	.4	"

The flood of foreigners from southern Europe to America has been coincident with many changes in industrial processes lessening the premium upon skill. Pullman affords spectacular proof of this. The advent of the steel car threw wood carving, cabinet making and many other skilled crafts on the scrap heap and substituted metal work demanding distinctly shorter training. Steel sleepers were first made about 1907. This year not a single one of wood is being manufactured. Of the ordinary coaches built on contract for railroads, about 75 per cent are steel body and wooden interior finish, 15 per cent are all steel, and only 10 per cent are of wood. More would probably be made entirely of steel but for the difficulty experienced in heating them.

The works, employing now 10,000 men, consist of three principal divisions: the passenger car construction shops with about 6,800, the repair shops with about 1,000, and the freight car shops with about 2,200. In 1885 Professor Ely found that the great majority were skilled artisans and that the unskilled constituted about one-quarter of the force. Today the force may be classified into: 5,000 or 50 per cent skilled, 2,600 or 26 per cent semi-skilled, and 2,400 or 24 per cent unskilled. The proportion of unskilled and semi-skilled would be still greater were it not for the introduction of many labor-saving devices.

When the steel construction began all the older and skilled employes were encouraged to learn the newer trades and officials say that many of the cabinet makers readily adapted themselves

to the changed conditions, utilizing much of their old skill in the steel cabinet work. But they frankly admit that the great amount of semi-skilled work such as the assembling, erecting and riveting of steel cars has borne hard on the older employes who cannot "stand the racket." Slavs, who "don't seem to have any nerves," take these jobs. What this means for the older employes was vividly pointed out by a Dutch tradesman in Roseland who said that when the steel car work came in about two hundred members of the Dutch church he attended left, saying that the change of trades was too much for them and that anyway "no white man would now want to work in some departments of the shops."

Nevertheless, the company officials are able to show a proud record as to the average length of service of their employes. Those who have served less than two years are for the greater part unskilled "floaters." The remainder—between two-thirds and three-fourths of the whole—have served over two years and make up the permanent force with an average service of no less than twelve years. In 1906 the number who had served twenty years or more was 641. Today it is estimated at over one thousand. A considerable number of employes started as young men of twenty to thirty when the shops were built in 1880, and are therefore men of fifty to sixty now. While the experience of these men includes the great strike of 1894, and company officials claim that most of the strikers came back, the other side of the picture is shown by a "broken and discouraged man" representing a superior type of the English working class—one of the strike leaders—who stood before Miss Addams three years afterward. "Although he had been out of work most of the time since the strike," she says in Twenty Years at Hull House, "he had been undisturbed for six months in the repair shops of a street car company, under an assumed name, but had then been discovered and

dismissed," believing that he was so blacklisted that his skill could never be used again.

The average wage is nearly 30 cents an hour. The lowest rate paid is 20 cents an hour, to unskilled day labor. The average for semi-skilled labor is 24 to 26 cents an hour for work by the day, but much more than this for piece work in the erecting and riveting departments. Mechanics earn generally over 40 cents an hour. It will be noted that the rate for unskilled labor compares favorably with the 17½ cents an hour paid by the steel corporation at South Chicago and Gary. There is a 54 hour week in all departments—9¾ hours a day, except Saturday when the shops close the year round at 12:15, as against the ten and twelve hour days, and until recently the seven-day week, of the steel workers.

Wage rates signify little, however, unless yearly earnings are computed from the time books. The company claims that work is steady, that in general fluctuations are not matters of weeks and days, but that at various times the orders of railroads for cars drop seriously, as they did in 1910. The only periodic slack season is one of six weeks each summer in the repair shops, the surplus workers being used in the construction shops. But the freight car shops, using mainly semi-skilled and unskilled labor are most often affected by intermittency of employment. Tested by different years the industry would seem to have rather serious ups and downs. In 1905, for instance, the number of employes went nearly as low as 1,100; in early 1910 it was almost up to 15,000; while at present it is about 10,000, which may perhaps be considered normal.

What becomes of the "casuals"? Many of them are wandering workmen who rarely stay long in one place, even with steady work, but are off the some spot of real or fancied advantage. Others are immigrants. But many, doubtless, native and foreign alike, "stay put"—especially if they own their homes—and worry along over periods of unemployment, or seek other work

in the vicinity to fill in. "Very irregular" work is given by the Chicago United Charities as one of the causes of poverty among Pullman work people. A man of good habits can usually get credit to tide him over the periods of unemployment. "It takes, however, a large part of the wages of the regular season to pay up these bills, so a decent standard of living is often impossible." Typical applicants for relief are:

1. Young man, support of old parents, laid off for three months. Bills accumulating and assistance asked.
2. Italian with wife and five children. Only irregular employment. Grocer had cut off credit, landlord pressing for rent. School principal reports children in need of shoes.
3. Dutch family. Father had been employed in shops twenty years, laid off for three months. Wife and six children.

Diversity of employment is probably a buffer against idleness when the main industry runs slack. The report of the state labor commissioners in 1884 shows that even at this early date Mr. Pullman was seeking to assure greater industrial stability to his town by encouraging other manufacturing concerns to locate near. Today, plants of the Sherwin-Williams Paint Company, the Chicago Drop Forge and Foundry Company, the Griffin Car Wheel Company, and other concerns are grouped just south of Pullman; the Illinois Central railroad shops are just to the north; the West Pullman factory district includes a plant of the International Harvester Company; and street or interurban cars reach many other large plants in the general region.

The labor policy of the Pullman company is conservative. While many of its employes are trade union members, the organizations are in no way recognized, but an "open shop" practice prevails. There is little indication of any more liberal attitude toward collective bargaining than that indicated in the reply of Vice-President Wickes nearly twenty years ago when President Cleveland's commission to investigate the Pullman strike asked if it was not inevitable that with the company's great power its representatives were always far superior in bargaining ability to the individual workman. "Yes, that's

The federal census enumerator had to use a boat in 1910 to make his count. Some of the shanties are blind pigs.

#### THE WORKS TODAY

The picture shows also the grade crossing of the Illinois Central and Michigan Central tracks, half a block from the main entrance to the Pullman works. Across the tracks, in Roseland, Kensington and other neighborhoods, live the majority of Pullman employees. Counting the Interurbans, from 200 to 300 trains rush over this crossing every day. Two through trains pass at top speed within a few moments of 5:30, quitting time for 9,000 men. The coroner's records for a recent period of 22 months show 41 deaths on railroad crossings in Pullman and vicinity. A showing up of the situation by a local newspaper, coupled with vigorous activities on the part of the South End Business Men's Association and various improvement associations, stirred the whole community. A committee of fifty citizens recently induced the Chicago City Council to pass an ordinance requiring the elevation of the tracks before December 31, 1916.

his misfortune," said he. Yet the question whether the 54-hour week should be divided into six days of nine hours each or into five of 9¾ hours, leaving Saturday as a 5¼ hour day was submitted to a vote of the men, who chose the latter arrangement. But one wonders how far the company would go in submitting questions which mean more to it than the alternative between six or half a dozen. The company's conservatism is indicated by its electing not to come under the provisions of the Illinois Workmen's Compensation law. Yet its policy in payment of damages to injured workmen is said to be increasing in liberality. Attention is also being directed to welfare work and as the readers of *THE SURVEY* know, the activity of one stockholder roused the company to an effort in preventing occupational diseases.<sup>1</sup>

It had been needlessly killing men by lead poisoning in the paint shops and by dangerous acids, fumes and dust-laden air in other departments. The success of the preventive efforts is shown by the fact that in July, 1911, there were 77 cases of lead poisoning out of 450 men employed in the paint department, while in August, 1912, not a single case was reported among 470 employed. Five doctors now care for injuries

as compared with one formerly. Thus far no nurse has been employed though her services, especially among the single men living in lodgings, would go far to prevent infections due to the improper care of minor wounds.

Civic conditions and agencies show interesting comparisons between the old paternalistic regime and the present company control. Decent housing was not the only way in which the company sought at the beginning to provide wholesome home surroundings. Exclusion of demoralizing influences was also part of the effort. With the exception of the bar in the Florence Hotel, no saloons were allowed in the town. Liquor interests seized upon the nearest available spot and thirty grog shops soon clustered at Kensington just across the railroad tracks and south of Pullman. This place quickly merited the name of "Bumtown" which still clings to it. Even until recently the last suburban train each night from the city down to Kensington and return was known as "the Bumtown turn-around."

With the changes in population and the property sale which did away with the early restrictions, saloons seem strangely slow in invading the old town. Aside from the hotel bar mentioned only five saloons have started up, one of them in a corner of the market house. And in the part of the town north of the shops but ten have come in. In fact few things are more striking to the observer who watches the swarms of men at the main gate during the noon hour than the absence of beer cans and the prevalence of milk bottles. From two milk wagons as many as 200 to 500 bottles of milk are sold each noon, and the number in very warm weather rises still higher. "Bumtown," however, lives up to its old reputation and boasts of fifty-two saloons, twenty-five of which are on the single block nearest to Pullman. The southern part of "Bumtown" is dubbed "Snarl town"—due, it is said, to its quarrelsome dogs—and is notoriously tough. Several prohibition districts, however, are stoutly maintained in Roseland and vicinity under the local option law.

#### PULLMAN'S NOON BEVERAGE

A typical roadside after lunch time. The two milk peddlers at the main gate—only one of seven entrances—have a combined sale of 200 to 500 bottles each noon, and as many as 600 in the warmest weather. One of the surprising things to the stranger is the almost entire absence of beer can "rushing."

<sup>1</sup>See What One Stockholder Did, *THE SURVEY*, June 1, 1912. P. 387.

The police administration of the district has not the highest respect of the better citizens. Indeed a scandal which came to the attention of all Chicago developed in an indecent entertainment to celebrate the presentation of a diamond star to the police lieutenant by a group of citizens of the sort usually interested more in the non-enforcement than in the enforcement of law. With such officials of law and order it is fortunate that the region seems to need their attention but little. An officer of the Juvenile Protective Association declares that although there are some "blind pigs" in the doubtful shacks along Lake Calumet and a few dance halls in "Bumtown," the neighborhood is the cleanest she has ever worked in. She finds evidence, particularly in Burnside, however, of loose relations in houses where a group of Slavic men have one woman as housekeeper.

The company management of the town sought to provide various wholesome substitutes for the demoralizing influences which were barred. Through the generosity of Mrs. Pullman the library, already mentioned, is still maintained, and its present circulation of books, greater now than formerly, is noteworthy in the face of the incoming Slavic, Greek and Italian population and the fact that it has no books in these languages. It is used mainly by children. The theater is now little used. Its location up one flight of stairs conflicts with Chicago's building requirements. And the people of Roseland, which has outstripped Pullman in size, prefer to patronize their own three motion picture and vaudeville theaters.

Recreation facilities show one of the most significant developments in the change from old to new. The island athletic field was a notably serviceable provision, but its glory is eclipsed by the splendid recreation center, Palmer Park, which the South Park Commissioners admirably placed so as to serve Pullman on the east, Kensington on the south and Roseland on the west. Its forty acres provide football and baseball fields, tennis courts, swimming pool, children's playground and wading pool, outdoor and indoor gymnasiums for both sexes, club rooms and an assembly hall for social gatherings and entertainments. The fine civic service of these Chicago recreation centers has often been described in *THE SURVEY*<sup>1</sup>. Suffice it here to say that the director of Palmer Park is intelligently alert to promote its neighborhood utility, and the "Pleasant Sunday Afternoons" he arranges through the fine assembly hall. It is worth noting that Palmer Park, serves as a frequent meeting place for the district representatives of the Juvenile Protective Association, the United Charities and the Visiting Nurses' Association and that in all the efforts for neigh-

borhood welfare which center at the park the school principals are enthusiastic co-operators. It is a pity that the same cannot be said of all the clergy. Although the churches are probably larger and better attended than in the average city neighborhood, they have in general taken little share in movements for community betterment.

Schools no less than recreation facilities serve to give assurance that public authority can go paternalism one better in meeting community needs. It is not fair, of course, to contrast the fine new George M. Pullman grade school which the Chicago Board of Education has built, with the discarded and forlorn building across the street, which marks the remains of a glory now dim. But the school built by the company is declared by school authorities to have been not up to the highest standards of its time. And it is particularly pointed out that its location where it would be a part of the showy front of

THE PULLMAN CLUB

Organized and still maintained by company officials and foremen and other leading residents of the town.

the town as seen from the railroad was not the best from the standpoint of its efficiency as a school. When Pullman became a part of Chicago the Board of Education might have bought the building, but the company would not sell. When the property was disposed of in accordance with the court order the board refused to buy, but continued to rent until it built the new school. Three other schools, including a high school, serve the vicinity of Pullman, and three of the principals have twenty years or more of service to their credit.

The community is now looking forward to the Pullman Free Manual Training School for which Mr. Pullman's will in 1897 provided \$1,200,000. This has now increased to well over \$2,000,000. While it has been contended that delay was necessary in order that the sum should become large enough to carry out the project most effectively, the trustees have been taken to

<sup>1</sup>See *THE SURVEY* for July 2, 1910.

task by a local newspaper, which also sought to show by the estimate of an accountant that the fund should by this time have reached nearly \$3,000,000. A head for the school has been chosen, Prof. L. G. Weld, formerly of Iowa State University, and it is expected that early in 1913 ground will be broken on the site of forty acres facing Palmer Park on the north.

The health conditions of Pullman and its vicinity seem to be fully up to and perhaps better than those of the average city neighborhood, though among the children of the poor in the block houses and other cheap tenements the work of an infant welfare nurse from the Chicago Department of Health finds plenty of scope. The most pressing immediate needs are for sewage disposal and hospital service. The sewerage system empties, through the Calumet river, into Lake Michigan which supplies the city's water. Accordingly plans are under way to provide a canal which will connect with the main Chicago sanitary canal and thus divert all sewage to the Mississippi. The problem of hospital service is one which affects the whole southern portion of Chicago.

Mr. Pullman, for some unknown reason, failed to include a hospital in his elaborate scheme of buildings. There are private hospitals at the Illinois Steel Works in South Chicago and at the Illinois Central Railroad shops at Burnside. Public-spirited citizens organized a small hospital in Pullman, which receives patients from the car shops as well as from the town in general. But the charity patient, whether for a clinic or the county hospital, must make the long journey into the central part of the big city. A fifteen mile journey—by Kensington police ambulance to the Illinois Central suburban train, thence in the baggage car to downtown Chicago, and then by another police ambulance to the county hospital—is certainly not conducive to a sick man's improvement. Instances are not lacking of deaths en route. But the situation will be remedied when a branch of the county hospital, for which land has already been bought at Burnside just north of Pullman, is built.

The growth of the neighborhoods west of Pullman directs attention to the matter of city planning. While the number of people living in the old town of Pullman is nearly the same as it was twenty-five years ago, Roseland, Kensington, West Pullman and Gano have all developed from rural communities until now, according to the 1910 census, the population table shows:

Roseland .....	20,901
Pullman .....	7,931
Kensington .....	6,328
West Pullman .....	6,025
Gano .....	4,660

The history of these towns is interesting. Roseland was settled by a group of Hollanders who left the old country in 1849 because of religious difficulties. Preaching services in Dutch are still held in three churches. Gano, just west of Kensington, and south of Roseland, contains many French Canadians, who are said to have come originally about 1885 to act as strike breakers during a strike at the brick yards. The Catholic church they founded has French preaching services on alternate Sundays.

The development of the section seems to have been along natural lines of traffic. From the standpoint of the Chicago City Plan no peculiar problems are apparent either in this newly built-up region or in the old arrangement of Pullman. The general district is following the usual course of an outlying portion of the city. Real estate operators are developing it by subdivisions. This means more or less haphazard growth, with attention focused on the profits to be gotten out of given plots rather than upon the development of the whole area in accordance with modern scientific town planning.

Interest in city planning seems to be absorbed in industrial, and particularly harbor, development rather than in residential growth. The utilization of Lake Calumet for harbor purposes was part of the original Pullman scheme. But in these later days the enterprise interests not only the industries of the Pullman vicinity but the whole of Chicago. With a direct channel leading from the Calumet river to Lake Calumet,

This swimming pool exemplifies modern community provision for recreation.

the dredging of the latter, and the construction in it of huge docks, the metropolitan harbor facilities would be greatly increased in a way to relieve congestion nearer the city center. A map indicating one of the tentative schemes is shown on another page. This scheme includes not only the harbor development, but a much needed diagonal avenue from Pullman and vicinity to South Chicago, another boulevard connecting with the Chicago boulevard system, and a park to be made possible by a filling in of the northern part of Lake Calumet. The location of the latter feature is criticized because of proximity to docks which would shut it off from the Lake Calumet water front. A park along the wooded banks of the Calumet river to the south is also proposed. Both lake and river shores are suggested park areas in the Chicago City Plan.

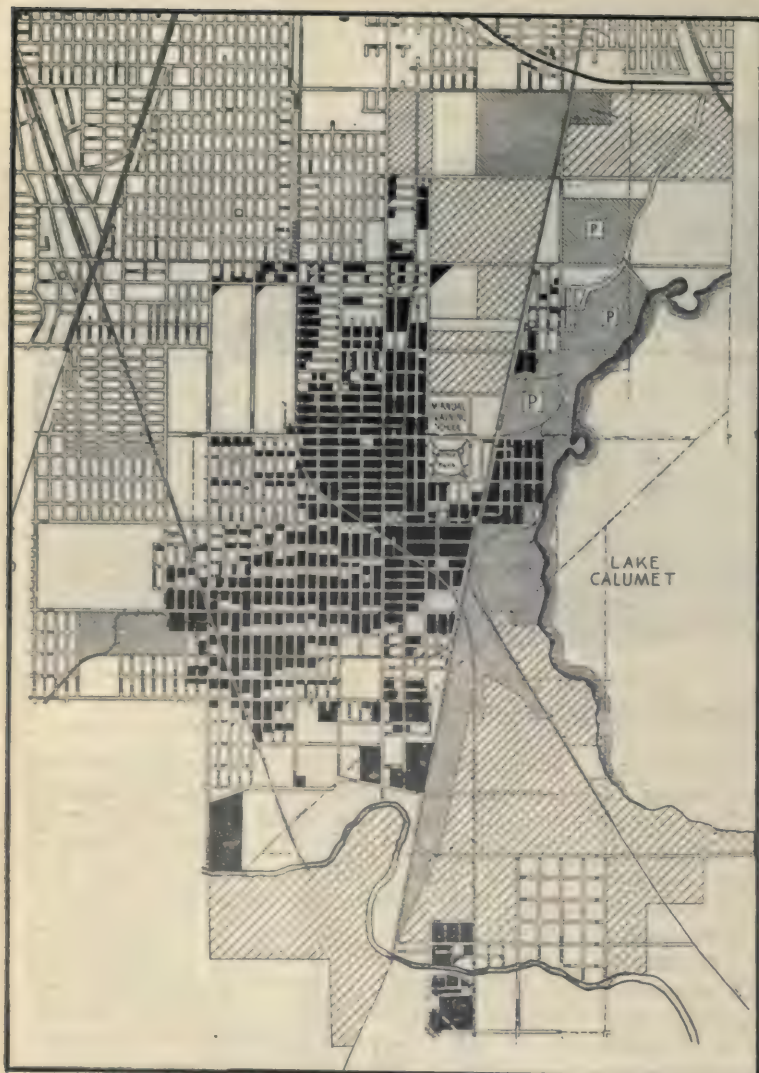

The civic spirit of the people shows strongly the influence of their experiences with industrial authority. Even in 1885 Professor Ely found difficulty in getting real opinions on living and working conditions from the dwellers in the town who feared "spotters" and dire consequences if they criticized the company. "To beat the company" was already considered praiseworthy. But the bitterness generated by the strike is of course the central fact which illumines prior and subsequent feeling.

While the company declares that the men were free to live where they chose, it is scarcely disputed that it felt compelled to give preference in work opportunities to company tenants. In ante-

bellum days the sturdy Dutchmen who had founded the neighboring village of Roseland made it one of the important stations of the "underground railroad" from the Ohio river to Canada. Lively stories are told of how Constable Kuyper played the genial host to the man-hunters who were searching for runaway slaves stowed in his own chimney. A similar spirit of independence was shown by not a few Pullman employes who chose to live in the freer air of Roseland rather than be sure of a job under the wings of paternalism. And when the Pullman company finally relinquished its ownership of Pullman the trend to Roseland continued.

In little ways the old suspicion and smoldering bitterness continues to crop out. It is related that soon after Professor Weld became the head of the projected manual training school he fell into conversation with a Pullman workman who did not know with whom he was talking. The professor sought to test out the enthusiasm of the workers for the new technical opportunities which would soon be available. But he is said to have been discomfited by a reply to the effect that "we have sweated our years away in those shops and if possible we'll keep our boys from slaving their lives out in them too." Whatever there may have been in the incident is not so important in itself as in its expression of some measure of sentiment, however unrepresentative of the whole. The prevalence of a similar feeling among the boys themselves with reference to working in the shops is vouched

### A VALUABLE LAND HOLDING

Growth of population and civic development are daily enhancing the value of the 2,900 acres of vacant land still held by the Pullman Land Association as part of the original tract of 4,000, regardless of any effort the Pullman Land Association may put forth. This is probably the largest single holding of vacant land in Chicago.

As pointed out in the first article of this series, the booklet distributed at the Pullman Company's exhibit at the World's Columbian Exposition in 1893 contains the statement that "the day is not only coming, but is near at hand, when the thirty-million dollar present capital stock of the Pullman Company will be covered by the value of the 3,500 acres of land on which is built the town of Pullman."

The price paid in 1880 is said to have averaged about \$200 an acre. A real estate man estimates it to be worth now at least \$1,500 an acre.

The association is selling portions from time to time for development as residential subdivisions.

### HOW THE REGION AROUND PULLMAN IS BUILDING UP

Map showing the location of schools, the territory used for manufacturing, railroad yards and other industrial purposes, and the approximately 2,900 acres of vacant land still held by the Pullman Land Association—the remainder of the original tract of 4,000 acres bought in 1880. The town of Pullman lies between Lake Calumet and the nearest railroad west. The recreation center—Palmer Park—and the forty acre site for the Pullman Free Manual Training School are also shown.

#### A SATELLITE IN THE MIDST OF SATELLITES.

Pullman in its relation to surrounding towns—Roseland, the old settlement of Holland Dutch; West Pullman, a more recent manufacturing town which boasts one of the plants of the International Harvester Company; Kensington, known as "Bumtown"; Burnside, where the Illinois Central Railroad repair shops are; and South Chicago, with the plant of the Illinois Steel Company.

One of the schemes for the development of Lake Calumet as a great harbor to serve Chicago is indicated. The system of locks is to be reached through a channel cut through from the Calumet river. A plan for the much needed diagonal thoroughfare from Pullman to South Chicago is shown with its connecting boulevard north to join the Chicago boulevard system. This plan also suggests the filling in and development of the north end of Lake Calumet as a park. Other plans suggest parks along the wooded banks of the Calumet river to the south.

for by a man whose position brings him into intimate contact with them. And the temper of the community is indicated in some degree by the fact that a fair minded and influential citizen was quite willing to believe the report—which may have been utterly false—that after a well paid old German had become expert in giving steel car fittings a "graining" to resemble mahogany the company put some young fellows alongside to learn the secret of his skill and then discharged him.

But the politics of the community afford perhaps the most significant side lights on civic spirit and the feeling toward the Pullman company. One of the struggles of the early days is related by the late William T. Stead in his book *If Christ Came to Chicago*. John P. Hopkins, as a young man, held a good position with the company but showed both his independence and usefulness to such an extent that although he was discharged for insubordination the company later re-employed him. Then, although Mr. Pullman was a pronounced Republican, Hopkins proceeded to carry the town for the Democratic ticket, his popularity among the voters being due, it is said, to admiration for his standing unabashed and victorious before the company. This was too much and he was discharged without ceremony. By the turn of political fortune he was Chicago's mayor at the time of the Pullman strike.

The extent to which the company has sought to dominate the politics of the community is a matter on which opinions vary, though probably any efforts of this sort were much more in evidence formerly than now.

At the time of Professor Ely's study, the village of Hyde Park—of which Pullman was then a part—had as town clerk and as treasurer officers of the Pullman company. With one exception every member of the local board of education was an officer of the Pullman company or its allied concerns. But no resident of Pullman, who was not an officer of the company, had any public office.

Today, one of the aldermen from the ward of which Pullman is a part, declares that an officer of the Pullman bank has frankly told him that he thought the company ought to have representation and influence in local politics especially with reference to police administration. But as a matter of fact the suspicion that any aldermanic candidate is "in" with the company is enough to make his defeat certain. This has actually happened twice—upon one occasion a

"BUMTOWN"

This was the name given to Kensington, across the tracks from Pullman, which provided the saloons and toughness not allowed in the town. It still lives up to its tradition, and the block shown in the picture has twenty-five saloons today.

former Pullman shop manager going down to disaster. A study of the election returns from the various precincts during a period of years shows a greater anti-company strength among men of independent mind who moved over to Roseland than among the more docile dwellers in Pullman.

The ward is known as a "banner ward" among the Socialists who normally poll from 12 to 18 per cent of the vote. Neither Socialists or their opponents say that this strength of their party is due directly to the strike of 1894, or to personal loyalty to the leader of the sympathetic strike, Eugene V. Debs. But there can be no doubt that the events of that tragic summer did much to give many men the frame of mind which made them easy converts to the Socialist Party, and the Socialist handbills pasted on the inside walls of the car shops indicate Socialist strength and zeal among the Pullman employees.

It seems reasonably clear, however, contrary to the conclusion to which the average man would naturally jump, that the election in this ward of the only Socialist alderman who ever sat in the Chicago City Council had little relation to any feeling generated by the strike a few years before. The Democratic candidate was manifestly unfit and the Municipal Voters' League endorsed the Republican. But a few days before the election the league learned of his suspicious past and issued a special bulletin advocating the election of the Socialist. Although the ward is normally Republican, its voters showed remarkable independence by electing the Socialist, who was a workman in the Pullman shops. He turned out to be a hopelessly incompetent, though entirely honest and sincere, alderman. It is interesting to speculate, however, what might have happened in Chicago's later politics if he had been a man of the vigorous ability of Victor L. Berger.

The independent voting thus shown is characteristic of the ward, and later when two Republican aldermen seemed to become less efficient and devoted in their public service, it promptly elected two Democrats who are now rendering efficient service, according to the estimate of the Municipal Voters' League. Both of the repudiated aldermen had voted for doubtful franchises. Even one of the better of these granted twenty-year rights to a street car company whose rights had still nine years to run. Under the terms of the new franchise there is a continuance of the old ten cent fare for the ride from Pullman into Chicago's downtown section. During these same tenures of office, moreover, a so-called "bargain" was made whereby the Pullman company agreed that if the city of Chicago would collect the garbage and refuse from Pullman it might dump

the same in Lake Calumet along the company's riparian rights. Thus considerable land was "made"—illegally, according to an Illinois legislative commission.

A better alderman who followed fought not only against this so-called "grab," but against the filling in of more land in Lake Calumet by manufacturing concerns just south of the Pullman shops. He furthermore stopped these concerns from building a fence across a street which had been open to the public for thirty-eight years. So it has come about that thirty years from the founding of this feudal industrial town a citizenship has developed which can scarcely be matched elsewhere in Chicago for vigorous independence in standing out against encroachment upon community rights by industrial interests.

The development of Pullman shows the constructive foresight of a pioneer mind. Mr. Pullman early recognized the advantages of the removal of industry to the suburbs and saw the strategic possibilities of a Calumet harbor. He secured much land while yet it was cheap, and realized the economics of wholesale town and house building. And he provided recreation and tenements far in advance of the times, setting standards which Chicago failed to follow until years later.

But, as we have seen, the break-up of the model scheme came through failure to reckon with the human element. The collective land values and other advantages of collective ownership were originally sought for the benefit of the company and not for the community. The company ownership of housing was not flexible. Nor would individual home ownership probably have been under the stress of industrial changes which have so affected the make up of the working force. There was no effort to devise a newer or more flexible plan. We have seen this neglect of the human side illustrated again in the failure to provide a hospital and adequate protection against industrial diseases.

Throughout the twenty years following the early clash between paternalist and striker, Pullman has had a new equilibrium. Inside the plant, the company has been in control. Like monopoly prices, kept down by potential competition, its power over the work day is limited only by the potential bargaining ability of the workers and not by their actual collective voice. But this autocracy which remains in control of the newer field of industry could not extend to the community life where citizenship is reinforced by the long traditions of Anglo-Saxon democracy. The experience at Pullman has shown that while the men have not been able to dictate to the company as to work, the company has not been able to dictate to the men as to life.

One thus returns with mingled impressions

from a voyage to rediscover Pullman. The melancholy reminders of a past, which had much that was worthy but which was swept away with the inrush of a newer spirit, cannot fail to appeal to the emotions. But the big feeling is one of faith in the movement of American democracy, which found at Pullman a turning point significant in ways we may yet only dimly appreciate. William T. Stead lamented over the fact that Marshall Field, Philip D. Armour and George M. Pullman—Chicago's big business triumvirate of that day, "each supremely successful in his own respective lines, each superbly generous and liberal in the matter of private benefaction"—failed

to utilize their remarkable talents in promoting the efficiency and service of Chicago as a municipality. But today, as one sees at Pullman the people providing for their own needs—splendidly as in the case of the schools and recreation center, imperfectly as in such administrative matters as street maintenance, gropingly as in the one-sided efforts toward city planning—and sees the instinctive righteousness and good judgment of the "plain folks" as revealed in political action, one finds a firmer assurance that not alone through the genius of great men but rather of America's common life the way lies toward the better civilization.

PULLMAN PRIOR TO THE STRIKE OF 1894.

## A MODERN LEAR

JANE ADDAMS

*[This was written in 1894, just after the Pullman strike and read before the Chicago Woman's Club and the Twentieth Century Club of Boston. It was not published at the time because of its personal nature. By chance it was written in a tense "as if it were already long past." Its present publication, however, has more than grammatical appropriateness; there is a message for today in its powerful analysis of the human equation in industry.—Ed.]*

THOSE of us who lived in Chicago during the summer of 1894 were confronted by a drama which epitomized and, at the same time, challenged the code of social ethics under which we live, for a quick series of unusual events had dispelled the good nature which

in happier times envelops the ugliness of the industrial situation. It sometimes seems as if the shocking experiences of that summer, the barbaric instinct to kill, roused on both sides, the sharp division into class lines, with the resultant distrust and bitterness, can only be endured if

we learn from it all a great ethical lesson. To endure is all we can hope for. It is impossible to justify such a course of rage and riot in a civilized community to whom the methods of conciliation and control were open. Every public-spirited citizen in Chicago during that summer felt the stress and perplexity of the situation and asked himself, "How far am I responsible for this social disorder? What can be done to prevent such outrageous manifestations of ill-will?"

If the responsibility of tolerance lies with those of the widest vision, it behooves us to consider this great social disaster, not alone in its legal aspect nor in its sociological bearings, but from those deep human motives, which, after all, determine events.

During the discussions which followed the Pullman strike, the defenders of the situation were broadly divided between the people pleading for individual benevolence and those insisting upon social righteousness; between those who held that the philanthropy of the president of the Pullman company had been most ungratefully received and those who maintained that the situation was the inevitable outcome of the social consciousness developing among working people.

In the midst of these discussions the writer found her mind dwelling upon a comparison which modified and softened all her judgments. Her attention was caught by the similarity of ingratitude suffered by an indulgent employer and an indulgent parent. King Lear came often to her mind. We have all shared the family relationship and our code of ethics concerning it is somewhat settled. We also bear a part in the industrial relationship, but our ethics concerning that are still uncertain. A comparative study of these two relationships presents an advantage, in that it enables us to consider the situation from the known experience toward the unknown. The minds of all of us reach back to our early struggles, as we emerged from the state of self-willed childhood to a recognition of the family claim.

We have all had glimpses of what it might be to blaspheme against family ties; to ignore the elemental claim they make upon us, but on the whole we have recognized them, and it does not occur to us to throw them over. The industrial claim is so difficult; the ties are so intangible that we are constantly ignoring them and shirking the duties which they impose. It will probably be easier to treat of the tragedy of the Pullman strike as if it were already long past when we compare it to the family tragedy of Lear which has already become historic to our

minds and which we discuss without personal feeling.

Historically considered, the relation of Lear to his children was archaic and barbaric, holding in it merely the beginnings of a family life, since developed. We may in later years learn to look back upon the industrial relationships in which we are now placed as quite as incomprehensible and selfish, quite as barbaric and undeveloped, as was the family relationship between Lear and his daughters. We may then take the relationship of this unusually generous employer at Pullman to his own townful of employes as at least a fair one, because so exceptionally liberal in many of its aspects. King Lear doubtless held the same notion of a father's duty that was held by the other fathers of his time; but he alone was a king and had kingdoms to bestow upon his children. He was unique, therefore, in the magnitude of his indulgence, and in the magnitude of the disaster which followed it. The sense of duty held by the president of the Pullman company doubtless represents the ideal in the minds of the best of the present employers as to their obligations toward their employes, but he projected this ideal more magnificently than the others. He alone gave his men so model a town, such perfect surroundings. The magnitude of his indulgence and failure corresponded and we are forced to challenge the ideal itself: the same deal which, more or less clearly defined, is floating in the minds of all philanthropic employers.

This older tragedy implied mal-adjustment between individuals; the forces of the tragedy were personal and passionate. This modern tragedy in its inception is a mal-adjustment between two large bodies of men, an employing company and a mass of employes. It deals not with personal relationships, but with industrial relationships.

Owing, however, to the unusual part played in it by the will of one man, we find that it closely approaches Lear in motif. The relation of the British King to his family is very like the relation of the president of the Pullman company to his town; the denouement of a daughter's break with her father suggests the break of the employes with their benefactor. If we call one an example of the domestic tragedy, the other of the industrial tragedy, it is possible to make them illuminate each other.

It is easy to discover striking points of similarity in the tragedies of the royal father and the philanthropic president of the Pullman company. The like quality of ingratitude they both suffered is at once apparent. It may be said that the ingratitude which Lear received was poignant and bitter to him in proportion as he recalled the extraordinary benefits he had heaped upon his daughters, and that he found his fate harder to bear because he had so far exceeded

the measure of a father's duty, as he himself says. What, then, would be the bitterness of a man who had heaped extraordinary benefits upon those toward whom he had no duty recognized by common consent; who had not only exceeded the righteousness of the employer, but who had worked out original and striking methods for lavishing goodness and generosity? More than that, the president had been almost persecuted for this goodness by the more utilitarian members of his company and had at one time imperilled his business reputation for the sake of the benefactions to his town, and he had thus reached the height of sacrifice for it. This model town embodied not only his hopes and ambitions, but stood for the peculiar effort which a man makes for that which is misunderstood.<sup>1</sup>

It is easy to see that although the heart of Lear was cut by ingratitude and by misfortune, it was cut deepest of all by the public pity of his people, in that they should remember him no longer as a king and benefactor, but as a defeated man who had blundered through oversoftness. So the heart of the Chicago man was cut by the unparalleled publicity which brought him to the minds of thousands as a type of oppression and injustice, and to many others as an example of the evil of an irregular sympathy for the "lower classes." He who had been dined and feted throughout Europe as the creator of a model town, as the friend and benefactor of workmen, was now execrated by workmen throughout the entire country. He had not only been good to those who were now basely ungrateful to him, but he felt himself deserted by the admiration of his people.

In shops such as those at Pullman, indeed, in all manufacturing affairs since the industrial revolution, industry is organized into a vast social operation. The shops are managed, however, not for the development of the workman thus socialized, but for the interests of the company owning the capital. The divergence between the social form and the individual aim becomes greater as the employes are more highly socialized and dependent, just as the clash in a family is more vital in proportion to the development and closeness of the family tie. The president of the Pullman company went further than the usual employer does. He socialized not only the factory but the form in which his workmen were living. He built and, in a great measure, regulated an entire town. This again might have worked out into a successful associated effort, if he had had in view the sole good of the inhabitants thus socialized, if he had called upon them for self-expression and had made the town a growth and manifestation of their wants and

needs. But, unfortunately, the end to be obtained became ultimately commercial and not social, having in view the payment to the company of at least 4 per cent on the money invested, so that with this rigid requirement there could be no adaptation of rent to wages, much less to needs. The rents became statical and the wages competitive, shifting inevitably with the demands of trade. The president assumed that he himself knew the needs of his men, and so far from wishing them to express their needs he denied to them the simple rights of trade organization, which would have been, of course, the merest preliminary to an attempt at associated expression. If we may take the dictatorial relation of Lear to Cordelia as a typical and most dramatic example of the distinctively family tragedy, one will asserting its authority through all the entanglement of wounded affection, and insisting upon its selfish ends at all costs, may we not consider the absolute authority of this employer over his town as a typical and dramatic example of the industrial tragedy? One will directing the energies of many others, without regard to their desires, and having in view in the last analysis only commercial results?

It shocks our ideal of family life that a man should fail to know his daughter's heart because she awkwardly expressed her love, that he should refuse to comfort and advise her through all difference of opinion and clashing of will. That a man should be so absorbed in his own indignation as to fail to apprehend his child's thought; that he should lose his affection in his anger, is really no more unnatural than that the man who spent a million of dollars on a swamp to make it sanitary for his employes, should refuse to speak to them for ten minutes, whether they were in the right or wrong; or that a man who had given them his time and thought for twenty years should withdraw from them his guidance when he believed them misled by ill-advisers and wandering in a mental fog; or that he should grow hard and angry when they needed tenderness and help.

Lear ignored the common ancestry of Cordelia and himself. He forgot her royal inheritance of magnanimity, and also the power of obstinacy which he shared with her. So long had he thought of himself as the noble and indulgent father that he had lost the faculty by which he might perceive himself in the wrong. Even when his spirit was broken by the storm he declared himself more sinned against than sinning. He could believe any amount of kindness and goodness of himself, but could imagine no fidelity on the part of Cordelia unless she gave him the sign he demanded.

The president of the Pullman company doubtless began to build his town from an honest de-

<sup>1</sup> While the town of Pullman was in process of construction the Pullman stock was sometimes called out on the New York Exchange: "How much for flower-beds and fountains?" To which the company naturally objected.

sire to give his employes the best surroundings. As it developed it became a source of pride and an exponent of power, that he cared most for when it gave him a glow of benevolence. Gradually, what the outside world thought of it became of importance to him and he ceased to measure its usefulness by the standard of the men's needs. The theater was complete in equipment and beautiful in design, but too costly for a troupe who depended upon the patronage of mechanics, as the church was too expensive to be rented continuously. We can imagine the founder of the town slowly darkening his glints of memory and forgetting the common stock of experience which he held with his men. He cultivated the great and noble impulses of the benefactor, until the power of attaining a simple human relationship with his employes, that of frank equality with them, was gone from him. He, too, lost the faculty of affectionate interpretation, and demanded a sign. He and his employes had no mutual interest in a common cause.

Was not the grotesque situation of the royal father and the philanthropic employer to perform so many good deeds that they lost the power of recognizing good in beneficiaries? Were not both so absorbed in carrying out a personal plan of improvement that they failed to catch the great moral lesson which their times offered them? This is the crucial point of the tragedies and may be further elucidated.

Lear had doubtless swung a bauble before Cordelia's baby eyes that he might have the pleasure of seeing the little pink and tender hands stretched for it. A few years later he had given jewels to the young princess, and felt an exquisite pleasure when she stood before him, delighted with her gaud and grateful to her father. He demanded the same kind of response for his gift of the kingdom, but the gratitude must be larger and more carefully expressed, as befitted such a gift. At the opening of the drama he sat upon his throne ready for this enjoyment, but instead of delight and gratitude he found the first dawn of character. His daughter made the awkward attempt of an untrained soul to be honest, to be scrupulous in the expressions of its feelings. It was new to him that his child should be moved by a principle outside of himself, which even his imagination could not follow; that she had caught the notion of an existence so vast that her relationship as a daughter was but part of it.

Perhaps her suitors, the King of France or the Duke of Burgundy, had first hinted to the young Cordelia that there was a fuller life beyond the seas. Certain it is that someone had shaken her from the quiet measure of her insular existence and that she had at last felt the thrill of the world's life. She was transformed by a dignity which recast her speech and made it self-contained, as is becoming a citizen of the world.

She found herself in the sweep of a notion of justice so large that the immediate loss of a kingdom seemed of little consequence to her. Even an act which might be construed as disrespect to her father was justified in her eyes because she was vainly striving to fill out this larger conception of duty.

The test which comes sooner or later to many parents had come to Lear, to maintain the tenderness of the relation between father and child, after that relation had become one between adults; to be contented with the responses which this adult made to the family claim, while, at the same time, she felt the tug upon her emotions and faculties of the larger life, the life which surrounds and completes the individual and family life, and which shares and widens her attention. He was not sufficiently wise to see that only that child can fulfill the family claim in its sweetness and strength who also fulfills the larger claim, that the adjustment of the lesser and larger implies no conflict. The mind of Lear was not big enough for this test. He failed to see anything but the personal slight involved; the ingratitude alone reached him. It was impossible for him to calmly watch his child developing beyond the strength of his own mind and sympathy.

Without pressing the analogy too hard may we not compare the indulgent relation of this employer to his town to the relation which existed between Lear and Cordelia? He fostered his employes for many years, gave them sanitary houses and beautiful parks, but in their extreme need, when they were struggling with the most difficult question which the times could present to them, when, if ever, they required the assistance of a trained mind and a comprehensive outlook, he lost his touch and had nothing wherewith to help them. He did not see the situation. He had been ignorant of their gropings toward justice. His conception of goodness for them had been cleanliness, decency of living, and above all, thrift and temperance. He had provided them means for all this; had gone further, and given them opportunities for enjoyment and comradeship. But he suddenly found his town in the sweep of a world-wide moral impulse. A movement had been going on about him and through the souls of his workingmen of which he had been unconscious. He had only heard of this movement by rumor. The men who consorted with him at his club and in his business had spoken but little of it, and when they had discussed it had contemptuously called it the "Labor Movement," headed by deadbeats and agitators. Of the force and power of this movement, of all the vitality within it, of that conception of duty which induces men to go without food and to see their wives and children suffer for the sake of securing better wages for fellow-

workmen whom they have never seen, this president had dreamed absolutely nothing. But his town had at last become swept into this larger movement, so that the giving up of comfortable homes, of beautiful surroundings, seemed as naught to the men within its grasp.

Outside the ken of this philanthropist, the proletariat had learned to say in many languages that "the injury of one is the concern of all." Their watchwords were brotherhood, sacrifice, the subordination of individual and trade interests to the good of the working class; and their persistent strivings were toward the ultimate freedom of that class from the conditions under which they now labor.

Compared to these watchwords the old ones which the philanthropic employer had given his town were negative and inadequate.

When this movement finally swept in his own town, or, to speak more fairly, when in their distress and perplexity his own employees appealed to the organized manifestation of this movement, they were quite sure that simply because they were workmen in distress they would not be deserted by it. This loyalty on the part of a widely ramified and well organized union toward the workmen in a "scab shop," who had contributed nothing to its cause, was certainly a manifestation of moral power.

That the movement was ill-directed, that it was ill-timed and disastrous in results, that it stirred up and became confused in the minds of the public with the elements of riot and bloodshed, can never touch the fact that it started from an unselfish impulse.

In none of his utterances or correspondence did the president of the company for an instant recognize this touch of nobility, although one would imagine that he would gladly point out this bit of virtue, in what he must have considered the moral ruin about him. He stood throughout pleading for the individual virtues, those which had distinguished the model workman of his youth, those which had enabled him and so many of his contemporaries to rise in life, when "rising in life" was urged upon every promising boy as the goal of his efforts. Of the new code of ethics he had caught absolutely nothing. The morals he had taught his men did not fail them in their hour of confusion. They were self-controlled and destroyed no property.<sup>1</sup> They were sober and exhibited no drunkenness, even though obliged to hold their meetings in the saloon hall of a neighboring town. They repaid their employer in kind, but he had given them no rule for the higher fellowship and life of association into which they were plunged.

The virtues of one generation are not sufficient for the next, any more than the accumula-

tions of knowledge possessed by one age are adequate to the needs of another.

Of the virtues received from our fathers we can afford to lose none. We accept as a precious trust those principles and precepts which the race has worked out for its highest safeguard and protection. But merely to preserve those is not enough. A task is laid upon each generation to enlarge their application, to ennoble their conception, and, above all, to apply and adapt them to the peculiar problems presented to it for solution.

The president of this company desired that his employees should possess the individual and family virtues, but did nothing to cherish in them those social virtues which his own age demanded. He rather substituted for that sense of responsibility to the community, a feeling of gratitude to himself, who had provided them with public buildings, and had laid out for them a simulacrum of public life.

Is it strange that when the genuine feeling of the age struck his town this belated and almost feudal virtue of personal gratitude fell before it?

Day after day during that horrible suspense, when the wires constantly reported the same message, "The president of the company holds that there is nothing to arbitrate," one longed to find out what was in the mind of this man, to unfold his ultimate motive. One concludes that he must have been sustained by the consciousness of being in the right. Only that could have held him against the great desire for fair play which swept over the country. Only the training which an arbitrary will receives by years of consulting first its own personal and commercial ends could have made it strong enough to withstand the demands for social adjustment. He felt himself right from the *commercial* standpoint, and could not see the situation from the *social* standpoint. For years he had gradually accustomed himself to the thought that his motive was beyond reproach; that his attitude to his town was always righteous and philanthropic. Habit held him persistent in this view of the case through all the changing conditions.

The diffused and subtle notion of dignity held by the modern philanthropist bears a curious analogy to the personal barbaric notion of dignity held by Lear. The man who persistently paced the seashore, while the interior of his country was racked with a strife which he alone might have arbitrated, lived out within himself the tragedy of King Lear. The shock of disaster upon egotism is apt to produce self-pity. It is possible that his self-pity and loneliness may have been so great and absorbing as to completely shut out from his mind a compunction of derelict duty. He may have been unconscious that men were charging him with a shirking of the issue.

<sup>1</sup>The bill presented to the city of Chicago by the Pullman company for damages received during the strike was \$26—the result only of petty accidents.

Lack of perception is the besetting danger of the egoist, from whatever cause his egoism arises and envelopes him. But, doubtless, philanthropists are more exposed to this danger than any other class of people within the community. Partly because their efforts are overestimated, as no standard of attainment has yet been established, and partly because they are the exponents of a large amount of altruistic feeling with which the community has become equipped and which has not yet found adequate expression, they are therefore easily idealized.

Long ago Hawthorne called our attention to the fact that "philanthropy ruins, or is fearfully apt to ruin, the heart, the rich juices of which God never meant should be pressed violently out, and distilled into alcoholic liquor by an unnatural process; but it should render life sweet, bland and gently beneficent."

One might add to this observation that the muscles of this same heart may be stretched and strained until they lose the rhythm of the common heart-beat of the rest of the world.

Modern philanthropists need to remind themselves of the old definition of greatness: that it consists in the possession of the largest share of the common human qualities and experiences, not in the acquirements of peculiarities and excessive virtues. Popular opinion calls him the greatest of Americans who gathered to himself the largest amount of American experience, and who never forgot when he was in Washington how the "crackers" in Kentucky and the pioneers of Illinois thought and felt, striving to retain their thoughts and feelings, and to embody only the mighty will of the "common people." The danger of professionally attaining to the power of the righteous man, of yielding to the ambition "for doing good," compared to which the ambitions for political position, learning, or wealth are vulgar and commonplace, ramifies throughout our modern life, and is a constant and settled danger in philanthropy.

In so far as philanthropists are cut off from the influence of the *Zeit-Geist*, from the code of ethics which rule the body of men, from the great moral life springing from our common experiences, so long as they are "good to people," rather than "with them," they are bound to accomplish a large amount of harm. They are outside of the influence of that great faith which perennially springs up in the hearts of the people, and re-creates the world.

In spite of the danger of overloading the tragedies with moral reflections, a point ought to be made on the other side. It is the weakness in the relation of the employees to the employer, the fatal lack of generosity in the attitude of workmen toward the company under whose exactions they feel themselves wronged.

In reading the tragedy of King Lear, Cordelia does not escape our censure. Her first words are cold, and we are shocked by her lack of tenderness. Why should she ignore her father's need for indulgence, and be so unwilling to give him what he so obviously craved? We see in the old king "the overmastering desire of being beloved, which is selfish, and yet characteristic of the selfishness of a loving and kindly nature alone." His eagerness produces in us a strange pity for him, and we are impatient that his youngest and best-beloved child cannot feel this, even in the midst of her search for truth and her newly acquired sense of a higher duty. It seems to us a narrow conception that would break thus abruptly with the past, and would assume that her father had no part in her new life. We want to remind her that "pity, memory and faithfulness are natural ties," and surely as much to be prized as is the development of her own soul. We do not admire the Cordelia "who loves according to her bond" as we later admire the same Cordelia who comes back from France that she may include in her happiness and freer life the father whom she had deserted through her self-absorption. She is aroused to her affection through her pity, but when the flood-gates are once open she acknowledges all. It sometimes seems as if only hardship and sorrow could arouse our tenderness, whether in our personal or social relations; that the king, the prosperous man, was the last to receive the justice which can come only through affectionate interpretation. We feel less pity for Lear on his throne than in the storm, although he is the same man, bound up in the same self-righteousness, and exhibiting the same lack of self-control.

As the vision of the life of Europe caught the sight and quickened the pulses of Cordelia, so a vision of the wider life has caught the sight of workingmen. After the vision has once been seen it is impossible to do aught but to press toward its fulfillment. We have all seen it. We are all practically agreed that the social passion of the age is directed toward the emancipation of the wage-worker; that a great accumulation of moral force is overmastering men and making for this emancipation as in another time it has made for the emancipation of the slave; that nothing will satisfy the aroused conscience of men short of the complete participation of the working classes in the spiritual, intellectual and material inheritance of the human race. But just as Cordelia failed to include her father in the scope of her salvation and selfishly took it for herself alone, so workingmen in the dawn of the vision are inclined to claim it for themselves, putting out of their thoughts the old relationships; and just as surely as Cordelia's conscience developed in the new life and later drove her back to her father,

where she perished, drawn into the cruelty and wrath which had now become objective and tragic, so the emancipation of working people will have to be inclusive of the employer from the first or it will encounter many failures, cruelties and reactions. It will result not in the position of the repentant Cordelia but in that of King Lear's two older daughters.

If the workingmen's narrow conception of emancipation was fully acted upon, they would hold much the same relationship to their expropriated employer that the two elder daughters held to their abdicated father. When the kingdom was given to them they received it as altogether their own, and were dominated by a sense of possession; "it is ours not yours" was never absent from their consciousness. When Lear ruled the kingdom he had never been without this sense of possession, although he expressed it in indulgence and condescending kindness. His older daughters expressed it in cruelty, but the motive of father and children was not unlike. They did not wish to be reminded by the state and retinue of the old King that he had been the former possessor. Finally, his mere presence alone reminded them too much of that and they banished him from the palace. That a newly acquired sense of possession should result in the barbaric, the incredible scenes of bitterness and murder, which were King Lear's portion, is not without a reminder of the barbaric scenes in our political and industrial relationships, when the sense of possession, to obtain and to hold, is aroused on both sides. The scenes in Paris during the political revolution or the more familiar scenes at the mouths of the mines and the terminals of railways occur to all of us.

The doctrine of emancipation preached to the wage-workers alone runs an awful risk of being accepted for what it offers them, for the sake of the fleshpots, rather than for the human affection and social justice which it involves. This doctrine must be strong enough in its fusing power to touch those who think they lose, as well as those who think they gain. Only thus can it become the doctrine of a universal movement.

The new claim on the part of the toiling multitude, the new sense of responsibility on the part of the well-to-do, arise in reality from the same source. They are in fact the same "social compunction," and, in spite of their widely varying manifestations, logically converge into the same movement. Mazzini once preached, "the consent of men and your own conscience are two wings given you whereby you may rise to God." It is so easy for the good and powerful to think that they can rise by following the dictates of conscience by pursuing their own ideals, leaving those ideals unconnected with the consent of their fellow-men. The president of the Pullman

company thought out within his own mind a beautiful town. He had power with which to build this town, but he did not appeal to nor obtain the consent of the men who were living in it. The most unambitious reform, recognizing the necessity for this consent, makes for slow but sane and strenuous progress, while the most ambitious of social plans and experiments, ignoring this, is prone to the failure of the model town of Pullman.

The man who insists upon consent, who moves with the people, is bound to consult the feasible right as well as the absolute right. He is often obliged to attain only Mr. Lincoln's "best possible," and often have the sickening sense of compromising with his best convictions. He has to move along with those whom he rules toward a goal that neither he nor they see very clearly till they come to it. He has to discover what people really want, and then "provide the channels in which the growing moral force of their lives shall flow." What he does attain, however, is not the result of his individual striving, as a solitary mountain climber beyond the sight of the valley multitude, but it is underpinned and upheld by the sentiments and aspirations of many others. Progress has been slower perpendicularly, but incomparably greater because lateral.

He has not taught his contemporaries to climb mountains, but he has persuaded the villagers to move up a few feet higher. It is doubtful if personal ambition, whatever may have been its commercial results, has ever been of any value as a motive power in social reform. But whatever it may have done in the past, it is certainly too archaic to accomplish anything now. Our thoughts, at least for this generation, cannot be too much directed from mutual relationships and responsibilities. They will be warped, unless we look all men in the face, as if a community of interests lay between, unless we hold the mind open, to take strength and cheer from a hundred connections.

To touch to vibrating response the noble fibre in each man, to pull these many fibres, fragile, impalpable and constantly breaking, as they are, into one impulse, to develop that mere impulse through its feeble and tentative stages into action, is no easy task, but lateral progress is impossible without it.

If only a few families of the English speaking race had profited by the dramatic failure of Lear, much heart-breaking and domestic friction might have been spared. Is it too much to hope that some of us will carefully consider this modern tragedy, if perchance it may contain a warning for the troublous times in which we live? By considering the dramatic failure of the liberal employer's plans for his employes we may possibly be spared useless industrial tragedies in the uncertain future which lies ahead of us.

# THE GAME OF LAW

MORRIS J. WESSELL

THE courts of the ancient Greeks met in utter darkness lest something in the accused's appearance should prejudice the judges either for or against him. Twentieth century American courts are sometimes so negligent of the real merits of a case that, according to an ex-president of the American Bar Association, they occasionally place "the definite article 'the' in sanctity above the honor of our wives and daughters."

The lawyer who made this statement had in mind the case of a man convicted in a western state of a dastardly crime to whom the supreme court of that state granted a new trial, solely on the ground that the indictment read "against the peace and dignity of state" instead of "against the peace and dignity of *the* state." The defense in its appeal had brought forth no new evidence, nor had it attacked the justice of the verdict. It did not even suggest that the inclusion of the sacred "the" would have affected the jury's opinion. But the court appears to have regarded the omission of a word of three letters from a stock phrase that adds little, if any, meaning to the indictment as more important than the plain merits of the case.

Some of our courts, it is true, do not allow the etiquette of the law to conceal the real issues in a case. The higher courts of Wisconsin usually, and those of California frequently, take a common-sense point of view, and the supreme court of Oklahoma has recently shown that it will at least start its career aright. An appeal was taken in this case—a criminal cause—because the phrase, "in the name of and by the authority of the state of Oklahoma," was omitted from the indictment. The court's decision, pronounced by the chief justice, left no doubt of its attitude. It said in part:

"When the record clearly shows that the purposes of the constitution have been accomplished, this court will hold that is enough. The supreme purpose of this court is to give the people of this state a just and harmonious system of criminal jurisprudence, founded on justice, supported by reason, and free from the mysteries of arbitrary technicalities . . . We will give full consideration to all such authorities which are supported by the constitution of Oklahoma. But we must confess to want of respect for precedents which were found in the rubbish of Noah's Ark and which have outlived their usefulness,

if they ever had any . . . If this be revolution, then we are and will continue to be revolutionary."

Such an attitude, unfortunately, is far from the general one. Technicalities bulk so large in the minds of many of our state jurists as to justify the remark of a teacher in a prominent law school that our legal system seems to be governed by the "sporting theory of justice . . . every time a litigant forgets a rule he is set back so many courts." Instances taken from many parts of the country make it seem that the law, instead of being a business-like arrangement for attaining justice, is an esoteric game, incomprehensible to all but lawyers and judges, in which hair-splitting distinctions and luck in following the mazes of complicated and, frequently, meaningless rules determine the victory.

The old cases of *Williams vs. The D. L. & W. R. R.* (81 A. D. 444, Affirmed. 177 N. Y. 564), which was tried seven times before it was settled and which lasted twenty-two years, and of the *Connecticut Mutual Life Insurance Co. vs. Hillmen* (145 U. S. Supreme Ct. 285), which after being taken to the federal supreme court on an appeal that enumerated one hundred and eight errors, was reversed by that court twenty-three years, after the original trial, make the fictitious story of *Jarndyce vs. Jarndyce* in *Bleak House* an American reality.

Nor are these two cases at all exceptional. The situation is so grave and widespread as to draw from President Taft the following statement:

"There is no subject upon which I feel so deeply as upon the necessity for reform in the administration of both civil and criminal law. It is not too much to say that the administration of the criminal law in this country is a disgrace to our civilization."

Actual cases confirm this opinion:

1. The supreme court of Florida reversed a conviction for grand larceny because the indictment charged the man with stealing a cow, whereas the evidence showed that the animal taken was a steer.

2. The South Carolina court, not to be outdone by its sister tribunal, set aside a similar conviction because the article actually stolen was not a piano, as the indictment specified, but a pianola.

3. In Alabama, a man named West was charged with stealing hides. Upon regular trial he was convicted. Upon an appeal to the su-

preme court the verdict was set aside on the ground that the indictment failed to specify whether the hides in question were the skins of sheep, or goats, or cows.

4. The Texas supreme court does not seem to have been markedly influenced by the sensible attitude of the neighboring Oklahoma tribunal, as the surprising case of a man named Cranthan exemplifies. Cranthan was found lurking suspiciously near a house that had been robbed a short time previously. The local authorities began to examine the man's record and habits, and finally arrested him. He was indicted by the grand jury in due time, and came before a jury for trial. The jury found him guilty of the crime, the specific charge being burglarizing a house of a certain description and containing six persons. The supreme court overruled the judgment of the lower court on the ground that the evidence showed that only five persons, instead of six, were present in the house at the time of the robbery.

5. The Ohio supreme court made a significant contribution, too, to legal metaphysics on June 28, 1910, when it gave its decision in the case of *Goodlove vs. State* (82 Ohio State Reports 365). Goodlove was charged with killing a man in a drunken brawl and was convicted and sentenced to fifteen years' imprisonment. In examining the record, upon appeal of the defendant's counsel, the supreme court found that the evidence did not make clear whether the victim's real name was Peter Stuckey or Frank McCormick. There was no question of what the man known as Goodlove had done, nor that someone had lost his life because of his drunken fury. In view of this fact, the mere circumstance that the victim—not Goodlove—boasted of two names, rather than the ordinary one, would not seem to be, to the ordinary intelligence, of much importance. The Ohio court, however, not only regarded it as important, but actually discharged the prisoner because of it.

*In not one of these illustrative cases, which can be readily duplicated in practically every state of the country, did the evidence leave any doubt of the accused's guilt. In not one did the defendant's counsel appeal on the ground that the accused was innocent of the crime charged against him. Every one of the appeals and every one of the reversals—each of which meant to the particular state concerned the cost of a new trial or the cost of having a criminal at large, and each of which established precedents for similar decisions in the future—was made on points which had absolutely no bearing on the real merits of the case.*

#### *What Is the Result?*

One of the indispensable foundations of a successful democracy is, of course, complete public confidence in the law and the courts of the land. And a legal system that magnifies the importance of such punctilioes of procedure as those which influence the decisions of so many of our courts

cannot fail to alienate public respect and trust.

Moreover, a judicial system that in general inclines to a reverence for technicalities which the Oklahoma court likens to "the rubbish of Noah's Ark" must find it difficult to arrive either at just or prompt conclusions. Such a system must clog its own operation and defeat the purpose for which it was constituted. A leading legal scholar, for example, finds that 35 per cent of the opinions of appellate courts deals with points of procedure. It is little wonder, therefore, that the supreme court of Colorado—surely far from the busiest state of the Union—was last May four and one-half years behind its program and had 2,800 untried cases before it. And it is no exaggeration to say that the young Pittsburgh lawyer who threw away his bar certificate because the few cases he obtained in his first year of practice would not reach the court calendar for another two years was not in an unusual predicament. Expedition is apparently not in the vocabulary of American litigation.

It is not at all surprising that, to President Taft, litigants seem to exist for the benefit of courts and lawyers and "not lawyers and courts for the benefit of the people and litigants." What would we think of a hospital that felt that patients existed for it, not that it was established to cure the sick?

Legal casuistry, furthermore, means criminal audacity. The Alabama courts, which have frequently inclined towards the opinion that legal embroidery is more important than legal principles, received considerable adverse criticism at the 1910 meeting of the bar association of that state, on the ground that criminality had markedly increased with the judges' insistence on strict adherence to petty technicalities. It was brought out that of seventy-five convictions for murder from which appeals were taken, "more than half were reversed and not a single one on any matter that could have influenced the jury," and that there were more homicides in 1910 in Jefferson County, Ala., than in all England, Scotland and Wales!

Throughout the country the growth of crime, competent observers say, is quite disproportionate to our population. The number of offenders serving terms in state prisons and penitentiaries per million of population was in 1880, 861; and in 1904, in spite of the increasing adoption of such lenient measures as parole and indeterminate sentence, 729. The number of homicides per million of population was in 1880, 32.2; in 1906, 108.9, an increase of over 200 per cent. No other prominent nation reveals a corresponding situation. Great Britain, of all European countries the one that resembles the United States the most, recorded 6 homicides per million in 1910; during the same year we registered 116 per million. The city of London was harassed in that

year with 19; the city of New York with 185.

It would be manifestly unfair and inaccurate to attribute this unfortunate situation entirely to the meticulous cavilling of our courts. Immigration brings in some European criminals in spite of the vigilance of our inspectors. And the industrial unrest, and the misunderstanding inevitably resulting from the contact of peoples of totally different standards and points of view produce others. But the fact is not gainsaid thereby that foreign criminals would not be so anxious to come here and that malefactors who develop out of unsettled social conditions would be more likely to restrain themselves if our administration of criminal law were unusually clearly efficient instead of almost notoriously inefficient. A federal judge of considerable experience says: "We have long since passed the time when it is possible to convict an innocent man; the problem which now confronts us is whether we can convict a guilty man." No less impartial and unsensational an observer than President Taft unhesitatingly says: "The prevalence of crime and fraud—which here is greatly in excess of that in European countries—is due largely to the failure of the law and its administration to bring the criminal to justice." And the judicial procedure of England, a country which clearly suffers less from criminality than we, is exceptionally free from the technicality fetish.

### *The English System*

It is not strange that light on American legal problems should come from England; for American jurisprudence—its defects as well as its virtues—is essentially English. Improbable as it may seem, the fact is that the policy of exalting the importance of technicalities, which now operates for the perversion of justice, originated in an effort to prevent injustice. Mediæval England oppressed the poorer classes not only in that it gave them no political privileges. It also strove to make them subscribe to a standard of conduct inhuman in its severity. Wholly trivial offenses received rigorous punishment. The historian Trail records, for example, that six men were imprisoned in the Tower—one of them died from the maltreatment accorded them there—because, while cleaning the rubbish from off the top of a shed, they had accidentally hit a courtier who was passing by. Relief from such a penal code apparently could be had in only one way—by calling the court's attention to petty errors in the prosecutor's case and by insisting that those errors be regarded as damaging to his case. And judges, perhaps sympathizing with petty offenders and realizing the difficulty of amending the penal code, seem to have adopted the point of view urged by criminal lawyers.

Unfortunately, this attempt to humanize the operation of the law was not an unmixed good.

The practice continued long after the sharp need for it had gone. If court procedure is to fulfil its function—provide the machinery for a certain phase of the administrative side of a legal system—it must be constantly revised to meet new conditions; at least it would seem that revisions in court procedure and in fundamental principles of a system of laws should reveal some correspondence—that the fact that a given form of procedure might produce radically different results under two different systems of laws would be recognized. But apparently no such development of opinion took place. The gradual infusion of more enlightened ideas of justice into the statutes of the land, which accompanied the slow transference of political power from the English sovereign to the people, did not materially change court procedure. The substantive law—that part of the law dealing with the rights of the individual—finally assumed a fairly satisfactory form. But the adjective law—that part of the law dealing with pleading and practice—underwent practically no change. As a consequence, that practice which had originally constituted the one safeguard of the individual from the oppression of the king and his associates and a barbarous penal code, now became the means whereby the criminal could safely prey upon organized society, and the unscrupulous citizen get the upper hand of his honest fellow. The practice of insisting upon conformity to relatively trivial formalities of procedure had gradually developed an overvaluation of the importance of the etiquette of the law, with the result that a technical error in a case against an indicted criminal not infrequently quashed the proceeding against him.

There was no real change in English procedure from the statute of Westminster to the reign of Cromwell, a stretch of four hundred years. Attention was called to the matter at intervals; but with characteristic British conservatism little effort was made at reform. The first real impulse in the right direction came from Jeremy Bentham, the author of several brilliant works on political and philosophical matters, who, in his *Morals and Legislation*, presented the need for reform in so vigorous a manner as to create an agitation that terminated in the English Judicature Act of 1826. Now that the British sense of thoroughness and love of fair-dealing was aroused, the glaring shortcomings of the law received increasing notice. However, there remained much to be done in addition to the improvements resulting from Bentham's efforts, as the frequent references in Dickens and other nineteenth century novelists to the law and the courts indicate. In fact, not until 1875 was the English system even as efficient as our own, the adjustments and changes made in the process of adapting English jurisprudence and court procedure to the needs of the new country appar-

ently giving our system an advantage which lasted for about a hundred years. But the reforms that were inaugurated in England in 1875 and those that were effected in two subsequent revisions have had such far-reaching influence that the American system, as compared with the English, may be said to be in the horse-car stage of development.

Perhaps the most striking feature of present-day English jurisprudence is that only the fundamental principles of the old common law are represented in it; the detailed specifications and the laborious procedure have been practically eliminated. Whatever *principles* of the old common law seemed suitable to modern conditions were retained in the latest code; but the procedure of the common law—its meaningless phrases, its bombastic rhetoric, its apotheosis of technicalities—was critically examined in the light of modern requirements.

In this country twenty states are still entirely common-law states—twenty states use a court procedure formulated generations ago. Railroads, mechanical contrivances, household comforts are all of the modern sort; but the legal forms used in the process of securing justice between man and man hark back to the days when the railroad was an undreamed dream, save for the slight changes that were made at the time our courts were established and for the desultory modifications in minor points that may have been made subsequently. The other states, it is true, have codes, but codes which, on the whole, mark little real improvement. Compromises with admirers of the old common-law systems were necessary when the codes were formulated. And after their adoption, lawyers and judges trained in the old school interpreted them, with the result that the codes of most states are now so encrusted with modifying interpretations that the situation is complicated rather than simplified. The code procedure, instead of supplanting the common-law procedure, is dependent upon it. The marked advance made by the English bench and bar in this respect is suggested in comparing the remark of a lecturer in the English inns that, "The English lawyer today has no more need of a knowledge of the extinct common law procedure than he has of the judicial procedure of the Assyrians," with the citation already referred to from one of the Oklahoma supreme court's decisions. The English lecturer and the Oklahoma court, evidently, entertain the same opinion of mediæval procedure—the one associating it with the procedure of the Assyrians; the other with the rubbish of Noah's Ark. But the Oklahoma court's attitude was so unusual in this country that it felt compelled to add, "If this be revolution, then we are and will continue to be revolutionary!"

The practical superiority of the English system over the American system, which results from the general point of difference just mentioned—the retention in England of but the principles of the common law—is shown in the simple regulation of appeals in English and in the common-sense form of such legal documents as the indictment in vogue in England.

Of the following legal forms, the first is from Rhode Island; the others are from England. Their comparative length and simplicity is interesting, to say the least:

Date and place, etc.

"A. B. being then sole and unmarried, in consideration that the plaintiff (then also sole and unmarried) at the special insistence and request of the said defendant had then and there promised the said defendant that she would marry and take to husband the said defendant when thereunto requested; her the said defendant then and there forthwith promised the said plaintiff that he would marry and take her to wife when thereunto requested; and although the said plaintiff, confiding in the aforesaid promise of the said defendant, hath always from thence hitherto refused to marry or contract matrimony with any other man whatsoever, and still remains sole and unmarried; and always from the time of making said promise was ready and willing and offered to marry and take to husband the said defendant; viz, on—, at the said—, yet the said defendant not regarding his said promise but contriving to deceive and defraud the said plaintiff in these particulars and totally to hinder her from the preferment and good fortune she would have met with by such marriage hath not taken her, the said plaintiff to wife, though the said defendant afterwards, to wit on the —, and often before and after that time, hath been thereto requested by the said plaintiff. But the said defendant hath always hitherto refused so to do. To the damage of the plaintiff \$50,000 as laid in her writ of —. Wherefore she sues."

Date, place, names of parties.

"December 27, 1906, defendant verbally promised to marry plaintiff. August 3, 1907, he married another woman. Plaintiff claims £1000 damages."

Date, place, names of parties.

"Plaintiff claims £500 for injuries sustained by him on May 5, 1906, while traveling on defendant's railroad, as a passenger from London to Bristol, such injuries being caused by the defendant's negligence."

Date, place, names of parties.

"Plaintiff, as executor of C. D., deceased, sues for the benefit of Elizabeth, widow, and William, Margaret, and Mary, children of the deceased C. D., who suffered damage from the defendant's negligence in carrying C. D. in its omnibus, whereby he was killed on January 10, 1907. Plaintiff claims £5000 damages."

Date, place, names of parties.

"The jurors of our Lord the King present that J. F. on the — day of —, one thousand nine hundred and —, at the city of — murdered, F. M."

Is it any wonder that the American lawyer or district attorney omits a "the" or a "said" or a "wherefore"? Which is the more sensible, the business-like, clear English form, or the stilted, antiquated, — yes, nonsensical — style of the breach-of-promise declaration from Rhode Island, with its "from whence hitherto," "hath always hitherto refused so to do," and its general redundancy?

### *English System of Appeals*

The difference between the machinery for disposing of appeals in the two countries is correspondingly great. In the United States a criminal has a general right of appeal. No matter how unequivocal the evidence and the jury's verdict may have been, the convicted man always can stay sentence by taking an appeal, which must be filed and considered as a matter of course. The man convicted of a crime in England has no such right. He can appeal only if he can show that new evidence has been found or that a principle of law is involved. Errors of spelling, omissions of words or phrases from any of the numerous legal papers used in a case, non-compliance with some of "the rules of the game" never constitute grounds for an appeal. The finding of a trial court is regarded as accurate unless the convicted man can show that its judgment was not in accord with the real merits of the case. The indicted man, having been convicted, must bear the burden of proof in asking for an appeal; the court is not presumed to have possibly been mistaken; he must show, with a fair degree of certainty, that substantial injustice was committed in the trial court's conclusion. In this country a significant percentage of appeals are granted on errors that could not possibly have affected the jury's attitude.

An appeal, having been once granted in this country, frequently becomes the starting-point of endless litigation. There are three or four higher courts whose attention can be successively invoked to hear an appeal if a criminal wishes to delay the execution of sentence. And even when each of these state courts has decided against him, the American criminal has one further recourse. He may, alleging that a federal question is concerned, petition the United States supreme court for a writ of error, which, even though no federal question is involved, may delay the carrying out of justice still more.

In England, on the other hand, there is practically only one tribunal for hearing criminal appeals. When it is clear that the trial court's judgment is questionable, the Court of Criminal

Appeals reviews the case. The Quarter Sessions Court does have a certain sort of appellate jurisdiction; but in general the one court disposes of all the criminal appeals arising in the operation of a judicial system which governs 32,000,000 people, and disposes of them with far greater promptness than do our numerous appellate courts. In the vast majority of cases, too—and surely this fact is some explanation of England's comparative freedom from criminality—the Court of Criminal Appeals grants no retrials. In 1907 only nine re-trials were granted. If the trial court's decision seems incorrect, the appellate tribunal enters final judgment immediately, and, it is interesting to note, only 20 per cent of the appeals taken result usually in reversals.

The trial court evidently is the keystone of the English system. In it the judge, not the prosecutor, is the commanding figure. He does not, like his American brother, merely umpire a contest between the public prosecutor and the defendant's counsel, but he actually conducts the trial. The English prosecutor has none of the aggressiveness of our district-attorneys; his duty is to investigate the case and to bring to light evidence, rather than to prosecute in the American sense of the term; and he is not even permitted to sum up before the jury except to explain errors. The English jury, too, has a simpler task than ours has. The judge lightens the work of both prosecutor and jury. He not only restricts the questions of the prosecutor and the counsel for the defense to relevant matters himself—not waiting for an objection to be made by one side or the other—but also calls his own witnesses, whom he may excuse from being examined by either or both of the attorneys. Nor may the prosecutor of his own accord decide either to drop a case for seeming lack of evidence or to ignore some of the counts of an indictment which makes several separate charges; the approval of the trial judge is necessary before either of these courses may be taken. The nature of the judge's address to the jury indicates most clearly, perhaps, his authority. He does not give merely general suggestions, but actual directions. He may order the jury to consider only certain counts of the indictment and to ignore the others, even though the public prosecutor feels that enough evidence is on hand to produce a conviction on all the counts. He summarizes and weighs the evidence, pointing out to the jury the real issues in the case, indicating which testimony is important, and which is irrelevant, commenting on the relative credibility of the witnesses, and endeavoring to eliminate the coloring introduced by the prosecutor and the defendant's counsel. And if the evidence at any time seems to him to point conclusively either to the guilt or to the innocence of the accused, he may stop the trial and

order the jury to return an appropriate verdict. In a recent instance the foreman of a jury refused to comply with the judge's direction, whereupon the judge declared that he would set aside any verdict other than the one he had ordered.

The theory behind this unusual distribution, or, rather, concentration, of power apparently is that justice is a matter of communal concern, and that the judge, being the impartial representative of the state, is the proper official to have real charge of a trial that presumably aims to attain justice. He is more likely to be zealous for the attainment of justice than any one else; he has no reputation to make as a successful prosecutor. That such a curtailment of the prosecutor's power would be satisfactory to all peoples is obviously questionable. It certainly smacks of paternalism to the American. But the day has gone by when any reform can be denied consideration because of the opprobrious name that can be attached to it. And it is interesting to note that President Taft and other prominent publicists have frequently advocated enlarging the powers of the trial judge. At any rate, there cannot be much question about the superiority of the results achieved by the English system.

#### *The Tucker and Crippen Cases*

We are indebted for our knowledge of the workings and the results of the English system to Professors Lawson and Keedy, teachers of law in western law schools, who constituted a committee sent out by the American Institute on Criminal Law and Criminology to investigate the English situation. To give their investigations point, their report includes a comparison of certain prominent criminal cases in England and in this country and a detailed account of the time consumed in the various steps in the process of trying an accused in England. It may be of interest to add to this discussion a summary of one of the comparisons this scientific report includes and to tabulate the results obtained.

The Tucker case, it may be remembered, was concerned with the trial of a man named Tucker, who was charged with having murdered Mabel Page at Weston, Mass., on March 31, 1904. Tucker was arrested on April 4—a decidedly unusual speed for American police. He was arraigned before the grand jury and indicted on June 9. The prosecution opened its case against him on January 2, 1905, nine months after his apprehension. The trial lasted twenty days, at the end of which time the jury rendered a verdict of guilty in the first degree. The case from this time on illustrates the idea of the lawyer who, upon seeing his client burst into tears upon announcement by the foreman of the jury of a conviction, said, "Tush! Tush! There's noth-

ing to worry over; the case has just begun." Tucker's counsel drew up and filed a bill of twenty-six exceptions, which reposed quietly on the court docket for over a year. In January, 1906, it came up for consideration, and on the twenty-second of that month it was denied. Sentence was pronounced on the twenty-seventh, one and three-quarter years after his arrest. But his cards even now were not all gone; technicalities had not yet been exhausted. A writ of error was sued out in his behalf, and the governor of Massachusetts was petitioned for a pardon. That official let the matter rest until the Massachusetts supreme court could give him clear instructions as to his powers, and, having received formal word from the court on May 29, he refused to interfere. Tucker was then executed, in June, 1906, two years and three months after his arrest.

Now, let us turn to the case of Dr. Crippen, which was so unusual in character as to attract attention from American papers—almost as great notice, in fact, as though the crime had been committed here. Dr. Crippen was arrested on June 21, on the charge of having murdered his wife. He was arraigned on August 29. The trial began on October 17,\* the jury being impanelled in eight minutes! Conviction was secured in four days. The appeal, which his counsel took, was not a means of securing him liberty for a year, as was the effect of the Tucker appeal, but was considered immediately. And Dr. Crippen paid the penalty of his crime on November 23, four months after his arrest.

The following table compares succinctly the two trials:

	TUCKER.	CRIPPEN.
Arraigned after arrest	3 mos. 5 days	3 mos. 8 days.
Trial began after arrest	9 mos.	4 mos.
Appeal lingered	1 yr.	Less than 2 weeks.
Sentenced, after arrest	21 mos.	
Executed, after arrest	2 yrs. 3 days.	4 mos.

And the table on the following page computed from the descriptions given by Professors Lawson and Keedy of the trials they witnessed, shows that the Crippen case received no unusual attention.

#### *What Can Be Done?*

It might be held that judges and lawyers are largely responsible for the inadequacies of our judicial system; and such an attitude might not be entirely unfair. One might hold that the average lawyer is so attracted by the powder and smoke of battle as to forget all about the general principles involved, and that many jurists are so enamored of their "jealous mistress," take so keen a delight in unravelling her hair-splitting problems, as to forget the real ends of the law and courts at times.

But such an attitude is far from unobjection-

CRIME CHARGED.	FROM COMMISSION OF CRIME TO ARREST.	FROM ARREST TO TRIAL.	DURATION OF TRIAL.	VERDICT.
Rape	5 da.	30 da.	2½ hrs.	Gulity.
Attempted Murder	1 "	19 "	2 "	Gulity but insane.
Attempted Murder	1 "	30 "	4 "	Gulity.
Rape	1 "	1 mo. 8 da.	2 "	Not Gulity.
Murder	1 mo. 4 da.	1 " 27 "	2 "	Gulity but insane.
Murder	1 da.	1 " 1 "	2 "	Gulity but insane.
Wounding with Intent to kill	8 "	1 " 2 "	1½ "	Gulity.
Arson	2 "	28 "	4 "	"
Rape	1 mo. 17 da.	11 "	4 "	"
Sacrilege	1 da.	4 "	1½ "	"
Attempted Murder	1 da.	3 "	2 "	Not Gulity.
Murder	2 da.	2 "	2 "	Gulity but insane.

able. Accuracy and precision are commendable qualities and are valuable ideals. Inasmuch as our legal system prescribes certain definite rules and forms, the judge can partly defend himself by declaring that he is but empowered to enforce the law as he finds it. Moreover, such an attitude is quite unpromising of real improvement. The lawyer makes neither the law nor legal forms. His function in society is to secure for his client the latter's full measure of legal rights. And, since legal forms have for all practical purposes become integral parts of the law, it is a bit unreasonable—and probably quite futile—to urge an attorney to neglect an opponent's technical error for the sake of the common weal when he knows full well that the opponent will make use of every loophole he leaves. The point of attack should be, not the administrators of procedure, but the instruments of procedure. Improvement will only be had when the rules of procedure and the legal forms that harbor technicalities are eliminated or modified. The destruction of the breeding places of such sacred pests as "against the peace and dignity of the state" and "in the name of and by the authority of the state," and their like, would seem a surer guarantee of common-sense decisions than sentimental appeals to duty. Nothing is so conducive to virtue as the thorough removal of temptation. The English have acted on this principle with decided profit.

#### *Efforts at Reform*

The American Bar Association has worked zealously for several years now to remedy the situation. After careful consideration for over four years, the committee in charge of the matter formulated a bill which was unanimously approved practically in its entirety at the annual meeting of the association at Seattle in August, 1908. The Judiciary Committee of the House of Representatives of the Sixtieth Congress, after making a few slight suggestions, reported it back to the Bar Association committee. At the next meeting of the association the amended form of the bill was adopted with but one dissenting vote. This bill proposed:

"That no judgment shall be set aside or reversed or new trial granted by any court of the

United States in any case, civil or criminal, on the ground of misdirection of the jury or the improper admission or rejection of evidence, or for error as to any matter of pleading or procedure, unless, in the opinion of the court to which application is made, after an examination of the entire cause, it shall appear that the error complained of has injuriously affected the substantial rights of the parties. The trial judge may in any case submit to the jury the issues of fact arising upon the pleadings, reserving any question of law arising in the case for subsequent argument and decision, and he and any court to which the case shall thereafter be taken on writ of error shall have the power to direct judgment to be entered either upon the verdict or upon the point reserved, if conclusive, as its judgment upon such point may require."

The bill was in charge of Representative R. W. Parker of New Jersey, the chairman of the Committee on Judiciary, who vigorously advocated its adoption. Yet it failed of passage, even with the tremendous influence of the American Bar Association behind it. In 1911 Judge Moon of Pennsylvania brought it to the attention of the House. This time the effort was somewhat more successful. It was not only referred to the Judiciary Committee and ordered to be printed, but it was placed on the House calendar too. And on February 6 it was passed by the House. The next day the Senate's attention was directed to it. The upper house gave it two readings, referred it to the proper committee, from whose hands it never emerged.

Representative Moon re-introduced the bill last year—some time in December. But the attention of the House was concentrated on so many important matters that little time seems to have been found for this rather unsensational but immeasurably important bill. Adjournment was finally reached without any revision having been achieved.

But even if Congress should pass the Moon, or a similar, bill, only the federal courts would be improved; the situation in the state courts, in which the most numerous instances of technicality worship occur, would not be affected in the least. Just how this crucial phase of the situation is to be remedied it is insuperably difficult to say. Much depends on the attitude and

the energy of the state bar associations; and much upon the character of the press of the various states. Oklahoma and Wisconsin—the one evidently determined to build a new and sensible system of political institutions; the other transforming itself into a political laboratory for the nation—have splendid records. New York, Texas, Ohio and Missouri (in which state the situation, according to Frank N. Judson, a veteran member of the American Bar Association, grows worse and worse), to name but a few, have need to look to their laurels. They have far from clean bills of health. The American

Institute of Criminal Law and Criminology, which publishes the *Journal of Criminal Law and Criminology*, is doing excellent work in arousing public opinion, in urging its members—leading lawyers, judges, psychologists, sociologists, and students of political science—to meet the problem, and in tabulating the tendencies of the courts in the different states. Perhaps it will succeed in supplying the intelligent direction that is needed to guide the rapidly awakening, but as yet undirected, public conscience to a realization of the importance of this old, yet apparently new, problem.

## NORAH

HELEN R. GUTMANN

One crowded tenement-lined block was Moira's theatre. A play never ending, never dull, was acted out below her as she sat in her second-story window. When, because of a curved spine and a withered leg, one cannot go out to meet Life, it is a wonderful thing to have her come so close. The angels of Life and of Death had never come so many times in a year to the entire parish at home, as into this crowded block in a single week. And besides, there was the moving van, the patrol wagon, and the ambulance, with the shrill and raucous street sounds for the orchestra.

Like a never-ending, ever-beautiful tapestry woven of human threads, life unfolded beneath the watchful, wondering eyes of the little lame girl, sitting at the window with her endless crocheting, crooning old Irish songs of life and love as her fingers flew and her eyes sought the street below.

She made no friends and rarely saw her neighbors except the one who came to take her finished crocheting. But she had no need of friends for she had Norah—Norah who met life and was woven into it, a brilliant thread in its sordid woof.

Those were happy days while Norah was at school, and Jim, the father, brought home a meager sum from his wage—earned chiefly by the sale of his vote. If, at times, Norah's speech sounded odd to Moira's old-world ears, it was but the change to the President's from the King's English, she thought, and herself tried to learn the Bowery argot.

But Norah saw life from another side, as an actor sees the bare stage, and the spinner the reverse of the gay web. Life, tenement life, was stripped of all illusions. She loved to hear of Irish villages, of churches guarding, like a shepherd, their flocks of graves, of leafy, green walks and of places where one roof, leaking though it be, sheltered but one family. Often she sat listening in the dusk while Moira sang of village life and love: songs as colorless to Moira as the endless thread that passed through her fingers, as pregnant with life to Norah as the motley cosmopolitan crowd that passed outside. For the womanhood that poor, lame Moira could never know, was stirring in pretty Norah. The dark, dirty walls of her two-roomed home oppressed and crushed her. Love time was drawing near, and her street-sharpened eyes read admiration in the eyes of men as they passed her. Vaguely, without understanding, she sought a freer, cleaner place away from the sights and sounds and odors of a hundred homes. And seeking, found only dimly-lighted hallways, street corners and, not least of all, the darkened moving picture shows.

That is why Moira looks alone from her window at Life, no longer a fair and amusing tapestry or play, but a thing terrible and beautiful, as a tiger is terrible and beautiful as it springs at its prey. And Moira waits, as she endlessly crochets, for the day that must surely come when Life, tired of her play, will throw back her broken toy.

# HEALTH AND THE NATIONS

THE HYGIENE CONGRESS AT WASHINGTON AND ITS MESSAGES TO THE PARTICIPATING GOVERNMENTS

IRA S. WILE, M. D.

NEW YORK

*[The true history of such a world-wide gathering of experts as the Fifteenth International Congress of Hygiene and Demography cannot now be written; a decade may go by before its effects on science, public knowledge and practical reform can be rightly gauged. The Survey is therefore attempting in this issue to draw only some of the more obvious lessons to be learned from its discussions, to give wider publicity to features of lay interest.]*

*Dr. Wile calls attention to medical and sanitary discoveries which affect everyday life, while Dr. Hamilton points to the hazards to health from smoke, dust, labor of mothers and other accompaniments of our industrial system. In Mr. Harrison's description and photographs of the exhibit there are valuable suggestions, both for those interested in the subjects illustrated and for any who may plan similar exhibits in the future.—Ed.]*

THROUGH nine miniature congresses, constantly in session and covering various phases of hygiene from the most technical micro-biology to the popular aspects of the hygiene of infancy, veritably there was international and inter-scientific activity at Washington the last week in September.

The immensity of the hygienic field traversed is but suggested by the fact that over 600 papers were presented before the various sections of this, the Fifteenth International Congress on Hygiene and Demography.

It is interesting to note that America had abundant opportunity to put a best foot forward. Of the 620 papers scheduled on the official program 170, or 27 per cent, were accredited to non-Americans. In the 450 papers by Americans there was excellent opportunity for presentation of the studies, researches, observations, and results of the hygiene experimentalists and demographers in this country. While perchance this congress will not present as startling immediate results as some previous congresses, the meeting attested the fact that our native hygiene is not stagnant. The principal facts that were presented as new discoveries which are to lead to

the further protection of the race were reported by American observers.

The distribution of their activities by foreigners indicates the difference in the advance of social development of American and European countries. For example, while in the section on micro-biology only 21 per cent of the papers were scheduled to be given by foreigners, the section on the control of infectious diseases showed 52 per cent of the papers to be by non-Americans. Similarly it is noteworthy that 49 per cent of the papers on military, naval and tropical hygiene, 42 per cent on dietetics and physiology, and 40 per cent on the hygiene of occupations were given by the foreign contingent. This suffices to indicate the fields of hygiene in which the foreign delegates took the maximum interest, but it was in just these fields in which they gave the best evidence of their greater progress over America.

Education and research, research and education represent the two messages of this congress. There must result a great stimulus to America to delve deeper into the domains of physical, economic, and social hygiene. From all sections there was a general demand for increased educational activity, medical social and statistical, to develop national hygiene so that it might be of greater social value to the community. As President Taft stated in his speech of welcome:

"If the government is to be more or less popular, the people themselves must be educated, they must understand the mass of hygiene restrictions, to accept them and to impose on themselves the burden of taxation, which is essential in order that progress shall be made at all."

It will be in the stimulation of a wider interest in hygiene, in increased educational opportunities, and in a widespread conservative legislation that we may look for a crystallization into action of the hygienic precepts that were accepted by the fifteenth international congress. There was special effort to take steps to standardize statistically our present knowledge as a basis for both scientific advance and public action.

### *Social Diseases and Cures*

The program was so overcrowded that it was difficult for any individual to masticate thoroughly more than one-ninth of the total available scientific pabulum, and the processes of digestion will needs be continued for some time before assimilation is complete. The most valuable section from the standpoint of the future of the race was also the most technical. The section on micro-biology and parasitology presented the most far-reaching results, leading to the protection of society from those diseases which are now so devastating and crippling. In this field particularly the American scientists presented most valuable observations. In the discussions regarding disinfection, the statement by Drs. Anderson and Goldberger that measles is not distributed by the scales from the skin was of the utmost importance. Their observation that measles is spread principally through sneezing lays stress upon the necessity of prophylactic care during the early stages of the disease rather than upon the fumigation following recovery from it. The importance of this observation is readily understood in connection with the medical inspection of school children and the prevention of epidemics in institutions of various kinds. Their further reports that they have been successful in inoculating monkeys with measles gives rise to much conjecture as to the possible developments in new methods of treatment which may shorten the course of the disease or lessen the number of its unpleasant complications. The same two representatives of the United States Public Health Service reported their interesting discovery that typhus fever may be spread through the medium of the pediculus or body louse. This serves to account for the presence of typhus in an endemic state in many of our large cities and draws attention to the necessity of the protection of clothing in institutions as well as in homes.

With the entrance of bubonic plague into this country it is important that some attack be made upon the real spreading factor of this condition. Dr. Novy of the University of Michigan announced the discovery of a micro-organism that is fatal to rats, which, with their parasites, are the principal disseminators of the plague.

Dr. Wollstein presented an able discussion regarding the production of a serum that had

been successful in curing influenzal meningitis in monkeys. Inasmuch as this condition is exceedingly fatal in man, it is to be hoped that further investigation will find the serum successful in curing humans.

The discussions focusing about the bacteriological examination of water for the presence of intestinal bacilli was participated in by Dr. Jordan of Chicago, Professor Gaertner of Jena, Dr. Smith of Lister Institute, England, Dr. Welsh of Johns Hopkins and Doctors Weber and For-net of Germany. Inasmuch as the Americans apparently deemed a bacteriological examination to be sufficient for the determination of typhoid bacilli, while the foreigners did not place the same confidence in this procedure or in the involved nomenclature of American bacteriologists, an attempt was made to standardize all tests. In view of the necessity of thorough standards of investigation and report to effectually wipe out typhoid fever from polluted water supplies, the action of the fifteenth congress should do much to hasten this desired day.

### *Control of Infantile Paralysis*

Probably the most important meeting of this section or of the entire congress had to do with poliomyelitis or infantile paralysis, as it is popularly known. Following the excellent discussions by Professor Pettersson of Sweden, Dr. Flexner of New York and Dr. Landsteiner of Austria, came the epochal announcement by Dr. M. J. Rosenau of Harvard, that the stable fly is an active transmitter of this disease. Dr. Rosenau has been successful in infecting monkeys through the agency of the bite of the stable fly. This undoubtedly represents the most important announcement of the entire congress. The attacks now made upon the mosquito and the common house fly will be carried on against the stable fly and its breeding places. For the first time a rational plan for the elimination of infantile paralysis has been suggested and the control of the disease comes within the range of probability. This does not mean, however, that there are no other factors in the spread of infantile paralysis. Further research is required to determine whether it may not be carried by many other insects.

In the line of preventive medicine was the plan for vaccinating against tuberculosis urged by Dr. Vaughn of the University of Michigan and also Professor Volpino's suggestion for the inoculation of pellagrins. We are fairly alive to the significant proportions of tuberculosis in the United States, but we have not yet awakened to the fact that pellagra is gradually appearing over a wider area within our borders. Study and research into the cause and control of pellagra is a distinct problem. Apparently it is becoming more complex. There have been particularly extensive investigations of pellagra in the United

States and there is much to be learned from foreign sources.

The section on dietetic hygiene was noteworthy by virtue of the excellent variety of its program, though there were very few striking advances announced.

Dr. John Long of Chicago precipitated interesting and vigorous discussion by his paper on substances used in the preservation of food. As a result of his experience with a "poison squad," he took issue with Dr. Wiley as to the harmfulness of benzoate of soda. The reopening of this chemical question simply indicates that wide, authoritative, and co-operative investigation must be made of the various preservatives, in order that legislation relating to this important branch of dietetic hygiene may be based upon uniform and uncontrovertible experiences and experiments.

Dr. Henderson of New Haven expressed the new view regarding ventilation, which was further dwelt upon in another section by Dr. Winslow of New York, that temperature and moisture of the atmosphere are the most important factors. His contention that inspired air is of less consequence than the air's action upon the skin appeared to meet with favor despite the fact that Dr. Rosenau showed the harmfulness of the organic matter in expired air. The whole problem of ventilation is apparently undergoing a marked change, due to careful scientific investigation, and the present attitude towards closed and open systems of ventilation should not be dogmatic until further investigation has been made. This is of the utmost importance in view of the present demand for revised methods of ventilation in schools, offices and factories.

Dr. Brieger made a direct appeal for the extension of public baths, on the grounds that they are as essential to health as public parks or comfort stations.

### *State and City Hygiene*

The section on state and municipal hygiene presented general arguments in favor of the establishment of a national health bureau. Dr. Theodore Thompson of London and Dr. Weber of Germany both dwelt upon the immense advantage to be derived from a centralized health system as opposed to the present decentralized methods in vogue in this country. It was brought out that health administration has been better developed by a single authority and by departmental systems with an executive head over each division of hygiene and sanitation. In view of our lax methods, America has much to learn from the experiences of England, Germany, Austria, and France.

Much of value was to be gleaned from the discussion by Drs. Rideal and Houston of London, who disagreed as to the storage of water for

drinking supplies. Dr. Houston felt that this procedure is proper for all water supplies later to be filtered and tends to prevent an emergency in case the filtration plant gives way at any time. Dr. Rideal felt that the effect of storage upon water is undesirable in that it does not really sterilize the water. He particularly advocated the use of ozone or chlorine for the chemical disinfection of drinking supplies. The crux of the situation was pointed out by Dr. Sedgwick of Boston, who demanded the sanitary control of watersheds where cities make use of an unfiltered water supply. This appears to be the most rational solution of the problem, in that it offers protection of the water supply in a sanitary manner so as to make less necessary sterilization or filtration, valuable adjuncts though they be.

In connection with the water supply naturally arises the problem of sewage disposal. The present status of sewage disposal seems to be problematic. Dr. Kern of Paris brought out the fact that there is a wide difference of opinion as to the value of sewage purification by means of the septic tank and various oxidation methods; Professor Gaertner of Berlin doubted the value of the methods of sewage purification so eagerly recommended by Messrs. Watson and Fowler of Birmingham and Manchester, England. The gist of the remarks of Dr. Hering, president of the American Public Health Association, called for an analysis of different classes of refuse with reference to their potential liability to cause disease or create a nuisance. He recommended that all types of refuse with the exception of ashes and rubbish should be buried or plowed under, although incineration appealed to him as a still more satisfactory method of dealing with all wastes.

The discussions on housing presented very little that is new save that popular education is the main factor in securing housing reforms, as was pointed out by Mr. de Forest of New York. Sir George Mac Crae dwelt upon the importance of city planning with reference to housing conditions, instead of spending all the effort upon the consideration of the city beautiful. Without deprecating the aesthetic side of city planning, he regarded the regulation of housing construction as of greater importance to the public health. Land was to be utilized for the purpose of home building, and he felt that cities should increase their holdings of land so as to lessen the possibility of land speculation. This advice appears to be most necessary in this country, and if municipalities would avail themselves of their opportunities, land values would not mount so steadily and housing conditions would be bettered.

Dr. Neff of Foxborough, Mass., again called attention to the fact that many appear to forget that but a small proportion of the users of alcohol are confirmed inebriates. His plea for cus-

todial care involved also greater attention to curative measures. A valuable contribution to hygienic procedure was suggested by Dr. Barnard of Indianapolis, who pointed out that a defect in all plans for sanitary food production consists in the fact that the handlers of the food receive no inspection. In order to remedy this defect and to prevent the spread of contagious diseases through food supplies, he advocated general regulations whereby all handlers of food from its raw state until its delivery to the customer should be under sanitary inspection.

The suggestion of Dr. Barnard received reinforcement in the section on the control of infectious diseases when Dr. Norris of New York asked for a clean bill of health from all employes at hospitals and summer resorts in order to eliminate disease carriers of all kinds. The fact that typhoid fever is readily spread by bacilli-carrying cooks makes this particularly important.

Dr. Doty of New York pointed out that clothing and infected rooms are less powerful sources of infection than the individual who is sick, while Dr. Chapin of Providence declared that air itself was scarcely to be regarded as a medium for the spread of infectious diseases. While neither of these views were received without mental reservation, it became evident that statistical research is essential in order to determine whether or not there is an immense wastage of public funds in fumigating plants.

#### *Oysters*

The oyster as a carrier of infectious diseases was partially defended by Dr. Pease, who declared that raw oysters are not as a rule dangerous from the middle of November to the middle of April. Inasmuch as the government has no control over oyster beds, he advocated strict attention by the various states to the waterways in which oysters are grown and especial care to prevent the pollution of such places.

The harmfulness of the common house-fly, which is at the basis of all fly-swatting campaigns, was reasserted in no uncertain terms by Dr. Howard of Washington and Professor Nuttall of Cambridge, England.

The problem of the bacillus carrier was shown to be somewhat complicated, inasmuch as it is difficult to control the movement of such persons. Dr. Loeffler of Germany regarded it possible for the government to regulate their wanderings. While the American representatives appeared to be quite in harmony with this, it presents one of the most difficult of all questions that local health authorities have to solve. It is obvious that the bacillus carrier is a menace to the community, and further investigation will be necessary before sufficient public opinion is created to support prohibitive legislation or quarantine methods.

No part of the discussion was more interesting than the discussion as to the vaccination treatment of typhoid fever. There is apparently insufficient evidence at present to warrant the assertion that sanitation is not an adequate factor in preventing the disease or that anti-typhoid inoculations are the sole factors for preventing it. While the clash occurred upon academic lines, the conclusion is obvious that further research and statistical study is essential to determine beyond cavil its effectiveness.

The problem of bovine tuberculosis received its usual discussion, the gist of which was presented by Dr. Park of New York. In his plea for more careful protection of the milk supply designed for infantile use, he reported that approximately 6 per cent of the children under five years who died from tuberculosis were infected with the bovine type of the germ. Dr. W. Ramsay Smith of South Australia presented the general value of the compulsory notification of pulmonary tuberculosis and pointed out its immense hygienic importance. The laxity of the laws in this country regarding the notification of tuberculosis is highly discreditable, and we shall never know how the disease is spread through the wandering of consumptives until there exists some carefully organized scheme of notification, and to this attention should be given by all our state boards of health.

#### *Hygienic Education*

From the standpoint of popular interest no section was more interesting than that of the hygiene of infancy and childhood, presided over by that pediatric pioneer, Dr. A. Jacobi of New York. The necessity of open-air schools and open-air instruction was insisted upon by Dr. Knopf of New York as a partial remedy for the 3 per cent school population which he regards as suffering from tuberculosis. In addition to the economic waste resulting from the education of children whose average life is under eight years, he drew attention to the great loss to the country from the failure to give hygienic school houses to normal children. Inasmuch as at the present time there is a great increase in the number of fresh air schools for anæmics and tuberculous children, it seems timely that the suggestion for fresh air classes for normal children should be given more attention. Our present plan appears to be to wait until children are physically diseased before instituting the remedial measures which would be equally advantageous as a method of prevention.

In the method of teaching hygiene in public schools the development of the theme along social lines was suggested by Dr. Wile of New York, with a view to securing intelligent citizenship as a result of hygienic instruction. Dr. Walker of New York precipitated active discussion by making it clear that with our present

methods of school disinfection it is impossible to prevent the transmission of disease within the schools, inasmuch as the children themselves are the most active carriers. The plan he has suggested for school disinfection is by means of the wet spray, as being the most effective, economical, and certain.

One of the most important papers from the social point of view was the study of school children of the stockyards district given by Dr. Caroline Hedger of Chicago. Her statistical study showed retardation and physical defects to be most frequent among the children coming from families with low family incomes. The conclusion showed in a very convincing manner that the problem of retardation is closely bound with the economic conditions of the family, and is not wholly due to the defective arrangement of school curricula or to the question of late attendance upon school or the difficulties of language.

In connection with the problem of medical school inspection, Dr. Buergerstein of Vienna urged that more stringent measures be pursued by governmental authorities in order to secure adoption of the suggestions regarding the physical improvement of school children. A great wastage occurs in any system of medical school inspection which does not include some plan for carrying out the advice given by the medical inspector. That such a plan is possible and desirable was evidenced by the results of Dr. Storey, who, by a plan of exclusion from classes, secured the active co-operation of parents, so that more than 90 per cent of the students under his care followed the advice recommended by the medical examiners.

### *Heredity vs. Environment*

As an example of some of the unusual statements presented at the congress, Dr. Kerley of New York offered an interesting discussion attempting to prove that character building is dependent upon environment. He apparently places little stress upon the heredity factors in so far as they may influence character development. With the present fight for feeble-minded children the influence of environment may play an important role in child evolution, but it is not equal to that of heredity, as was shown by the papers by Dr. Goddard of Vineland, N. J., on *The Prevention of Feeble-Mindedness* and by Dr. Salmon on *The Preventable Cause of Mental Diseases*. The entire discussion on mental hygiene was illuminating as indicating the new attitude towards mental diseases, and seems to suggest that those who claim to be eugenists have before them a definite piece of research in order to determine statistically the relative importance of heredity and environment in the determination of weak character. Dr. Matus of Chili urged

the establishment of universal physical standards for children so that it may be possible to determine whether or not a child really measures up to normal.

The problem of the midwife received thorough discussion by Miss Noyes of Bellevue Hospital, New York, and it was made apparent that the midwives bear a distinct place in the infant welfare problem. The discussion indicated a difference of opinion as to the field of usefulness of midwives, but the consensus of opinion appeared to be in favor of education, licensure and municipal supervision.

An important and suggestive meeting of this section was devoted to oral hygiene, the results of which may be summed up in the statement that as decay is preventable, proper mastication of food should be taught and adequate care of the teeth given during the first six years of life. The permanent teeth may be conserved by proper tooth-brush exercises. The dentists themselves were not strongly in favor of dental clinics, inasmuch as their work is largely remedial and their possibilities for developing prophylactic work is decidedly limited. The dental nurse is advocated as being capable of doing effective training in such a way as to lessen dental caries.

Mr. Folks of New York in a discussion of the foundling deprecated the free and easy manner in which so-called charitable institutions relieve healthy mothers of the care of their children. Inasmuch as the mortality rate among institutional children is far higher than among those living at home, by accepting the responsibility for the care of children institutions are virtually increasing the mortality rate. Particularly important is it to protect childhood where parents have no real reason for being separated from their children. The actual number of abandoned children or true foundlings is surprisingly small, and the voluntary surrender of children to institutions should be greatly restricted.

The main theme of the section on military, naval and tropical hygiene dealt with the compulsory prevention of venereal diseases in the army and navy. There seemed to be general agreement that attempts to eradicate them are useless and that therefore prophylaxis is imperative.

Dr. Seidelin of Liverpool, England, while announcing the discovery of a parasite which may possibly be the cause of yellow fever, created considerable excitement by asserting that yellow fever still exists in the Panama Canal Zone. Drs. Sternberg, Craig and Birmingham of the United States Army promptly repudiated this suggestion and gave ample proof. Further important discussion in this section related to the use of the anti-typhoid vaccine, following the paper by Dr. Fornet of Germany. The experiences of the armies in England, Germany, France, United States and Japan tend to show

that general vaccination is essential for protecting large encampments, and must be a compulsory part of the military and naval hygiene of the future.

The section on the hygiene of traffic and transportation dwelt with unusual force upon the spread of disease through transportation vehicles in the first place, and, secondly, through the unsanitary construction camps which are to be found around all railway construction.

#### *Pamphleteering Immigrants*

In dealing with the problems of emigration and immigration Dr. Constatas of Greece made valuable suggestions that may have immense value in guiding the future acts of the participating nations. He advocated the compulsory examination of each emigrant in his own country. He also suggested that immigrants who have been in contact with typhoid fever should be detained and vaccinated. His suggestion that each immigrant upon landing should be given a pamphlet, written in his own language, that deals with the sanitary laws or regulations of his adopted country, is certainly worthy of wide attention.

The subject of the sub-section dealing with sex hygiene was fruitful of many valuable ideas. It was most interesting to note the distinctly feminine character of the audience, showing that women are becoming aroused to the interest of securing adequate and frank information on this most important subject. Dr. Kelly drew attention to the fact that attacks upon the prostitute herself amounted to very little, that the saloon and brewery were in more ways related to this problem than the female offender. Dr. Kelly invoked the aid of the church and demanded that it sing fewer hymns and take more part in this movement for eliminating the white slave traffic. Bleecker Van Wagenen of New Jersey, in an address on the question of surgical sterilization, stated the usual eugenic problems of controlling the breeding of paupers, the feeble-minded, criminals and other defectives. His various remedies for controlling the present situation included segregation, sterilization, eugenic education, restrictive marriage laws, better environment and polygamy. It is needless to say that his advocacy of polygamy was hardly popular, nor did the reasons given seem adequate to the women present. Dr. Bigelow's discussion on sex hygiene was practically along the same line as the report of the committee for teaching sex hygiene. Their methods involved the gradual education of children along biological lines, with lessons preferably given by the parents, and graded according to their mentality and precocity. It was urged that the constructive features in sex education be dwelt upon, while the pathological side be relegated to the background.

#### *Demography*

The section on demography was especially successful. The model bill which was suggested by Dr. Wilbur and which has been enacted into law in Pennsylvania, Missouri, Massachusetts, Kentucky and Virginia, apparently satisfied the delegates as being a valuable plan for securing the registration of vital statistics, such as should be adopted by the various cities. Julia C. Lathrop, chief of the Federal Children's Bureau, proposed the compulsory registration of illegitimate children, and her suggestion will undoubtedly receive adoption in some sections of the country.

E. B. Phelps of New York showed conclusively that despite the increase of population infant mortality has actually decreased throughout the United States, and especially during the past decade. While infant mortality is at present exceedingly high, and unnecessarily so, in view of the fact that 50 per cent of the infant mortality is preventable, the decrease is absolute and general. According to Mr. Phelps, the establishment of milk stations is insufficient to affect to any large extent the total infant mortality. His plea is for universal education which will develop more intelligent motherhood and which will, through the home itself, give better attention to conserving infant lives. By this means alone will it be possible to make a marked decrease in the infant mortality rate.

John Koren of Boston drew attention to the doubtful value of the statistics relating to criminals that are to be found throughout the world. It is well to contemplate his statement, growing out of his expert work for the Census Bureau, that the criminal statistics of the United States fail to rise to even an approximate standard of statistical value. Professor Field of Chicago made this fact even more patent by demonstrating how little statistical information we have relating to heredity and crime, heredity and disease and mental defects. His plea for conservatism in eugenics until adequate statistics are compiled is in harmony with the findings of the International Eugenics Congress recently held in London.

The position of women as a national asset was discussed in a most vital way by Dr. Zahn of Munich. He dwelt particularly upon women's services as an educative force and as an inspiration for the home, while appreciating her value as an industrial force that has to be recognized in the present plan of industrial competition.

The gauge of the conference lies in the recommendations to the participating nations. A tendency in all the resolutions is toward uniformity in standards and statistics. One involved the proposal that an international committee be appointed to consider the methods of investigation, classification and differentiation of the organisms of the colon typhoid group. The purpose

of this move is to secure greater uniformity in these methods and a provisional standard of certain tests which shall be recommended for the investigation of organisms belonging to this group. Two other resolutions favored uniform tabulation and analysis of the official returns of occupational diseases, with compulsory notification of such diseases in countries where it does not now exist. The designation by the navy of every country of a medical representative to confer with the representatives from other navies and to recommend uniform methods and tables for expressing international-naval statistics; the publication periodically (and, if practicable, annually) in every country of statistics of births, deaths, marriages and divorces; the appointment by states or large cities which publish demographic statistics of registrars or sim-

ilar officers sufficiently trained in medicine and demography to interpret demographic statistics, and adequate provision for the training of men fitted to fill such positions; the gathering, in connection with the census, of family statistics, including those of children both born and living; the publication of information giving the order of births in families; the appointment of a commission to report on the subject of uniformity of criminal statistics and especially uniform nomenclature; the use in different countries of disinfectants which can be controlled by a simple bacterial test—these are other recommendations contained in the dozen or more resolutions passed by the congress. The permanent international commission was instructed to take the necessary steps to create a permanent bureau for these international congresses in the future.

## FATIGUE: SMOKE: MOTHERHOOD

AND OTHER EQUALLY VARIED FACTORS WHICH TURN THE WORLD'S WORK INTO A PROBLEM OF LIFE AND HEALTH

ALICE HAMILTON, M. D.

MEDICAL OFFICER (1910) ILLINOIS OCCUPATIONAL DISEASE COMMISSION

**S**ECTION IV of the International Congress of Hygiene and Demography, devoted to the diseases and accidents of industry, was distinguished by the presence of several well-known foreign members, as Sir Thomas Oliver, the foremost British authority on dangerous trades, Sir Arthur Whitelegge, chief officer of the British Factory Inspection Department, and Professor von Frankl-Hochwart of the University of Vienna, a noted neurologist.

Perhaps it was the presence of these men in the audience that made one listen a little critically to the American papers with their continually recurring references to the financial aspect of the problems the section was studying. Of course, we know that the waste of human life and strength means a loss of money value to the community, but is it necessary to lay stress on this point when you are addressing an audience of physicians, sanitarians and social workers, none of whom thinks that the money loss is the real measure of the evil?

As one listened with the ears of the foreign visitors, one had the mortifying conviction that they would depart with all their preconceived ideas strengthened, to declare that it is quite true that Americans measure everything in life in dollars and cents. Yet most of the men who were conveying this impression are as far as possible from holding a mercenary view of life. They were simply using what they supposed to be the strongest argument. One could not help wishing that the speakers had taken for granted

in their auditors a respect for life and health simply as life and health and not as an economic asset to the community.

The first session was one of the best of the week, dealing as it did with the subject of fatigue as a disease-producing factor. Dr. F. S. Lee, whose paper should really be printed in full, took up the effect of temperature and humidity on fatigue. The results of these elements, seen most clearly in life in the tropics, may also be studied in such occupations as mining, baking, laundering, canning and cotton weaving, which must be carried on under tropical conditions. We all know how much more exhausting the heat is in summer when it is accompanied by great humidity and the reasons for this were given by Dr. Lee. A high degree of humidity lessens evaporation from the body and the accompanying elimination of bodily heat; therefore, the temperature of the body rises, a feverish condition with rise of temperature comes on, and this affords the proper chemical condition for excessive susceptibility to fatigue. In fever there is an increased breaking down especially of protein bodies and an incomplete oxidation so that intermediate products accumulate in the blood and these substances, lactic acid and other acids, for example, are poisonous or fatiguing to the muscles. Naturally this condition is increased if muscular work is done at the same time.

Other papers dealing with fatigue were Dr. Blake's on the effect of unnecessary and irritating noise and Dr. Gould's on eye strain, both

of them, curiously enough, drawing their illustrations from the telephone girls who bid fair to become the stock laboratory material for research into the industrial neuroses. Josephine Goldmark called attention to the fact that fatigue is the most widely spread disease-producing factor in industry, affecting, as it does, the largest number of workers, many of them in occupations inherently harmless, but accompanied by excessive strain through speeding up or long hours. She made a strong plea for scientific research into the fatigue of different industries, whether caused by monotony or overspeeding, or by over-long hours.

It is hard to select from the wealth of material provided by the five days' session of this section those subjects that would be most interesting to readers of *THE SURVEY*. Perhaps the papers on smoke as a disease producer would be as timely as any. Pittsburgh, appropriately enough, is making a study of her smoke problem, and Dr. William Charles White, of the Department of Medicine, University of Pittsburgh, gave a very interesting report, illustrated with charts, of investigations into the influence of density of smoke on mortality from acute and chronic pulmonary infections, taking pneumonia and tuberculosis as typical instances. Pittsburgh, as he pointed out, is specially well adapted to such a study because of the hills which surround the centers of smoke production in the city and make areas of well-defined density in the valleys along the rivers, with areas of lessened density on the low-lying hills and comparative freedom from smoke on the higher hills. The smokiest regions are inhabited not only by the poor, but by very well-to-do people, which makes it possible to rule out poverty and overcrowding as influencing the results.

The determination of smoke density was made by precipitating the smoke content of different quantities of air, not as has been done in federal investigations by the distance of vision from certain observation centers, a method which the Pittsburgh investigators consider to be of little value. Dr. White's chart showed that the curves of smoke density and of mortality from tuberculosis in the different wards do not run parallel, that Pittsburgh has a comparatively low death rate from tuberculosis and that the latter is apparently unaffected by the smoke content of the air. With pneumonia, however, the case is quite different. Here there is a remarkable parallelism in the two curves and such factors as density of population and poverty are apparently of little importance, for the prosperous districts have as high a proportion of deaths from pneumonia as the poorer districts, if their smoke density is the same. Dr. White said that pneumonia had of late years assumed a terribly acute and fatal form in Pittsburgh and that he was

convinced that smoke was a very important factor in the severity of the disease. He urged that a popular crusade for the prevention of pneumonia be inaugurated, which should use the same methods as the successful crusades for the prevention of tuberculosis.

The dust and smoke problem was also the subject of the first public address, that given on Monday evening by Sir Thomas Oliver, who illustrated by means of lantern slides the slow hardening effect on the lung tissue of successive deposits of so-called harmless dust and soot. He made some interesting statements as to the increasing evils of dust stirred up by automobiles. In England he declared it has become evident that the vegetation along roads frequented by motor cars is gradually becoming stunted, that birds are deserting such regions and that fish are disappearing from the streams crossed by such roads, all these changes being caused by the choking effect of the dust.

Two papers, one English, the other American, dealt with the relation between infant mortality and the factory work of women. Apparently the material for study was similar in the two countries, but the conclusions arrived at are different. Dr. Reid, working in Staffordshire, England, compares two groups of families in the same domestic circumstances and with the same hygienic surroundings, but in the case of one group, the inhabitants of the pottery towns, women are employed in factory work after marriage, while in the second group living in the iron and colliery towns there is no employment for women. The average infant mortality in the pottery towns exceeded that in the other towns by 28 per cent for a period covering thirty years. An intensive study of the histories of 5,000 infants under one year of age born in families of the artisan class in the pottery towns in 1908 showed that the rate was 43 per cent for babies of factory mothers in excess of the rate for babies of mothers employed at home.

Following this paper, Charles Verrill gave the results of a similar study made in Fall River by the Bureau of Labor. Here the mortality among babies of mothers who work in factories is compared with that of babies of mothers in the same social class but not so employed. The conclusions gained in Fall River are quite different from Dr. Reid's as far as the influence of factory labor is concerned. It would seem at first sight as if there must be a close connection between an infant mortality rate of 177.6 per thousand births and the employment of 29.8 per cent of the women over ten years of age in the cotton mills, but the bureau's investigators, who inquired minutely into 580 of the infant deaths in 1908, were unable to find that factory labor on the part of the mother played an important role in the death of these babies. Improper feed-

ing and lack of intelligent care was responsible for the high mortality among children of mothers at home as well as those of mothers at work and the improper feeding was usually not due to the mother's employment, for only 7.7 per cent were prevented by their work from nursing their babies. The others either could not for lack of breast milk, or were unwilling to do so. Mr. Verrill concludes that the cause of the excessive infant mortality in Fall River is to be found in the mother's ignorance of the simplest requirements of hygiene, all other causes being secondary to this.

Two papers from New York belonged logically together and should really have been given in the following order, first that of Dr. Annie Daniels on home work in the tenements, showing the widespread evils of home industry, with its practically complete freedom from legal regulation, and second the paper by Lillian D. Wald, of the Nurses' Settlement, giving a picture in strong contrast to this—that of an industry in which conditions and hours of work are controlled by rules formulated in joint conference by employers and employees. That the evils of

home industry are not peculiar to our country was made evident by M. Marié-Davy, whose paper on the situation in France revealed the same deplorable conditions resulting from the same reluctance to interfere with what have been held to be the rights of the home. Dr. Ludwig Teleky of Vienna, spoke of the need in Austria of legislative control for home industries, especially the raising of the age limit for such work to sixteen years and the prohibition of work in dangerous occupations under eighteen years. Austria-Hungary has one of the worst home industries, if not the worst, very largely developed, namely, the making of cheap pottery, which is covered with lead glaze and decorated with lead colors. Dr. Teleky thinks these home potteries are responsible for most of the lead poisoning occurring among Austrian and Hungarian potters.

The papers on hook-worm disease, on brass poisoning and lead poisoning, on caisson disease, on tuberculosis, and on the accidents of industry, were of equally vital importance. They would well repay reading in the proceedings soon to be published.

#### ILLUSTRATING THE WORK AGAINST INJURY AND DEATH ON RAILROADS

Exhibit of the New York Central Railroad—one of fifty or more spaces given to commercial and industrial concerns to show methods of protecting life and health. While illustrating some of the accident prevention schemes discussed before Section IV of the congress, this part of the exhibit also embodied some of the ways of "putting ideas across" described by Mr. Harrison in the article beginning on the next page.

A CALIFORNIA HEALTH EXHIBIT ON WHEELS

Dr. W. F. Snow, Secretary California State Board of Health, brought from the Potomac the health car which has traveled up and down over the long stretches of the Golden State bringing a knowledge of sanitation, health and hygiene to the very doors of its citizens.

# INVENTING FOR HEALTH

A Picture Summary of the Health Exhibit of the Fifteenth International Congress on Hygiene and Demography

AT THE patent office in Washington patent number one million was recently issued. It was something of an event. It meant that American genius had produced a million ideas which almost a million people believed it would pay to protect. And the bedlam of models embodying these ideas make an extensive showing—a continuing exhibit, if you please—of America's commercial and industrial enterprise.

A month ago Washington had

By SHELBY M. HARRISON

*Photographs taken for the Department of Surveys and Exhibits, Russell Sage Foundation, by Dr. Millard Knowlton, of the New Jersey Board of Health, and E. G. Routzahn, of the Department of Surveys and Exhibits.*

on display the creations of another kind of inventive genius. It was an exhibition of methods for safeguarding life and for popularizing the best knowledge on how to keep well,—in this country, a relatively new field

as compared with that of economic invention. With life and health universally recognized as of greater importance than anything else, our dilatory and ungenerous interest as a nation in spreading knowledge of public

FIELD HOSPITAL UNITED STATES ARMY

Set up on the exposition grounds and supplied with its regular quota of officers and men.

OPEN-AIR KITCHEN OF THE UNITED STATES ARMY

Outside the exhibition hall the army showed various types of stoves and ovens adapted for quick movements. Screened bread racks are seen in the first tent on the right.

**DIMENSIONS OF THE PROBLEM OF INSANITY IN THE UNITED STATES**  
 The exhibit of the National Committee on Mental Hygiene set an excellent example in topical and unified groupings of material.

health would seem unexplainable if it were not exactly in keeping with the federal government's policy of expending disproportionately larger sums on the health of cattle, hogs and other live stock than on human beings. It is analogous also to the practice of our cities in spending dis-

proportionately larger amounts for the protection of property from fire than for the protection of human beings from sickness, disease and death.

This second collection was the Exhibition on Health of the Fifteenth International Congress on Hygiene and Demography; and it represented

**STOVES AND KITCHEN UTENSILS TO FIT LITTLE HANDS**  
 An exhibit of attractive models showing methods used in the Louisa M. Alcott Club, Boston, in teaching household, personal and public hygiene to children from four to fourteen years of age.

**"NO RATS, NO FLEAS;  
NO PLAGUE DISEASE"**

Model showing the breeding places of rats which constitute a public menace through the possibility of spreading plague. From exhibit of United States Public Health Service.

**HOME INSTRUCTION IN  
FOODS AND COOKING**

A new idea in models showing healthful and unhealthful meals for both children and adults. Part of exhibit of New York Association for Improving the Condition of the Poor.

the first attempt in this country to make a national exhibit of all phases of health work. The general subjects treated were: hygiene of infancy and childhood, sanitary control of food and food supplies, school hygiene, oral hygiene, hygiene of exercise, industrial hygiene, military and naval hygiene, sex hygiene, mental hygiene, communicable diseases and hospitals, sewage and water supplies, state and municipal hygiene, housing and vital statistics; and it included exhibits from more than 230 organizations. Of these, something over forty were from local organizations privately financed; eleven were from state organizations privately supported, and nineteen

there was too much material for the space available, making the whole exhibition cramped. Incidentally this appearance was emphasized by the highly colored bunting which draped the ceilings and confused the view instead of tending to set things out in clear relief.

While the possibilities for novel methods of graphically presenting information were by no means exhausted, a considerable variety was used. Photographs and placards were more universally employed than any other one device. Both were in varying sizes, some of the photographs being well labeled, but others had too little accompanying explanation and many had far

#### FEDERAL ACTIVITIES IN HEALTH AND SANITATION

A part of the exhibit of the United States Public Health Service showing data on insect disease carriers, causes of death among miners, hook-worm disease, rabies and tetanus. The models show sanitation plans for government posts.

from national organizations also privately supported; while thirty-eight were official state department exhibits, fifty had city government backing and fifteen represented federal government departments and bureaus. Upwards of fifty were exhibits owned by commercial and industrial concerns.

But the thirty-eight state exhibitors came from only half as many states—practically all north of the Mason and Dixon line—New York and Massachusetts sending the greater number. Of the city exhibits, privately financed, New York and Boston sent most. A number of large cities and many states were not represented; but even then

more than would be read by one passer-by in ten. The placards were white, gray, black and a few between-shades, with Roman and old English lettering, usually too much of the kind used. There were charts showing quantities and proportions by circles, pyramids, rectangles, parallel lines and curves, most of them very effective; maps with data shown by colors, cross-hatchings, varicolored pins and stickers; bottles and jars showing relations and proportions by different colored marbles and beans; miniatures and models of school houses, hospitals and asylums. Realistic reproductions were used even farther; in one were shown typical healthful and unhealthful

**IN THE GLOW OF THE CAMP FIRE**  
Exhibit of the Camp Fire Girls illustrating an attractive feature of the movement.

meals for children by using plaster of Paris models of dishes and foods, the latter painted in natural colors; another reproduced a model life-sized dental clinic ready for use; and still another showed typical good and bad food store conditions, with real pumpkins, potatoes, cabbages, pies, cakes and doughnuts on hand. Specimens of diseased flesh and bone preserved

**CROSS-SECTION MODEL**  
Showing floor and wall plans and their construction.

in alcohol represented another type of display; and at another end of the hall were live boys, who had suffered from hook-worm disease and were then under treatment.

Moving devices did not figure prominently; they consisted chiefly in the flashing of electric lights in groups and at various intervals. Three state health cars, fitted up to spread health knowledge in California, Louisiana, and Maryland, were open to visitors in the local Union Station.

At most of the exhibit booths printed pamphlets were handed out; and a few exhibitors,

#### **EFFECTIVE PROPAGANDA AGAINST INFANT DEATHS**

One of the best unified exhibits displayed. Panels are of uniform size and fold into compact and easily transportable cases. The model for a receiving home for foundlings and mothers with their babies was part of the exhibit of the Department of Child-Helping, Russell Sage Foundation.

BEARINGS OF IMMIGRATION ON INSANITY

Charts and maps of excellent mechanical workmanship but illustrating the need for standardizing shapes and sizes of exhibit material.

realizing the importance of personal explanations, had someone on hand all day to explain the diagrams and devices (and they always got a big share of the visitors).

The variety of display methods included a few features outside the building on the exhibition grounds where an exhibit of model playground apparatus, a field hospital, a field commissary with demonstrations of bread baking in the field, and a camp of Boy Scouts were to be seen. A detailed description of each exhibit is neither possible nor desirable here; a better idea is to be had from the accompanying photographs.

The Committee on Organization of the International Congress awarded testimonials for specially meritorious exhibits. In deciding the awards the jury considered originality of treatment of the subject material, method of presentation, and care displayed in the preparation of the exhibit. The

POPULATION STEPPING STONES IN NEW YORK CITY

A series of cubes showing the population growth by decades in New York City. An interesting and well executed idea of doubtful value except to the mathematician, who can estimate the relative volumes of cubes. The second cube at the right end is over 50 per cent larger than its immediate neighbor on the right, a fact not clear at first to the untrained eye.

testimonials took the form of diplomas of superior merit and diplomas of merit, sixteen of the former being awarded and something like fifty of the latter.

Those receiving diplomas of superior merit were:

American Association for Study and Prevention of Agriculture, for an exhibit of the work of vention of undue infant mortality;

Bureau of Chemistry, United States Department of Agriculture, for an exhibit of the work of the bureau in relation to pure foods and drugs;

Medical Department, United States Army, for an exhibit showing the investigation and methods of eradication of certain communicable diseases;

The National Committee for Mental Hygiene for exhibits illustrating

a. Causes of the apparent increase of insanity;

b. Heredity of feeble-mindedness;

c. Means for the prevention of insanity;

American Museum of Natural History for exhibits

#### SEX HYGIENE TEACHINGS VIA THE HORRIBLE EXAMPLE

From the Army Museum: It was this sex hygiene section which provoked most discussion and sharp differences of opinion as to how far pathological conditions should be portrayed in exhibits before popular audiences.

Oral Hygiene Committee of the National Dental Association and National Mouth Hygiene Association for an exhibit on oral hygiene;

Department of Education of the City of New York for an exhibit of its work in physical training;

Massachusetts State Board of Health for an exhibit on the hygiene of occupations;

The Prudential Insurance Company of America for an exhibit on the mortality of occupations;

Experimental Shoe Board, War Department, for an exhibit of the work of this board;

a. Glass models of pathogenic bacteria;

b. On pollution of water and purification of water and sewage;

Sewer Department, District of Columbia, for an exhibit illustrating the construction and maintenance of sewers;

Massachusetts State Board of Health for an exhibit of its work in state and municipal hygiene;

American Federation for Sex Hygiene for an exhibit on methods of teaching sex hygiene.

American Medical Association for an exhibit of dangerous or fraudulent patent medicines.

#### DEATH'S MESSENGER

A much enlarged fly with Death astride, a part of the Indiana State Board of Health exhibit, attracted wide attention. Note the heavy ceiling decorations and the aspect of confusion they throw upon the exhibit, an unfortunate effect observed in many parts of the hall.

## ARTURO GIOVANNITTI<sup>1</sup>

MARY BROWN SUMNER

**H**ALF England came to echo the protestantism of an imprisoned tinker. We in America today are quick to respond to the poet of a Russian dungeon who sings of the wrongs of Russian peasants. But what of a lyric singer in a New England jail, whose arraignment of American democracy would put it on a par with Russian despotism?

Some of us may not follow him all the way because, though we acknowledge substantial justice in his criticism, we believe that the structure of democracy can be restored by other means than by destroying to rebuild on new found-

ations. But we are forced to recognize in the work of the Italian, Arturo Giovannitti, on trial in Salem for complicity in the murder of Anna Lopizzo in Lawrence, the first American poems in a world-wide outpouring of working class verse that is giving literary expression to that revolt against our present day institutions, industrial and political, which has expressed itself in action in the last three years in the mass strikes all over Europe, from Barcelona anti-militarists to disfranchised Belgian workers.

More particularly Giovannitti represents the polyglot internationalism of the industrial workers of Lawrence, for he is an Italian immigrant, only twelve years in this country, who has

<sup>1</sup>The poems are quoted from the *International Socialist Review* and the *New York Call*.

turned his hand to any kind of work, from that of the mine to teaching languages and editing the organ of the Italian-American industrial-socialists. He had written not only Italian prose and verse, but some English verse before his arrest. Among others is a poem called *Blind Men*, addressed to orthodox Christians, which is interesting in view of the fact that soon after he came to America he entered a Protestant theological seminary intending to prepare for the ministry.

It was as he sat with Joe Ettor on the Prisoner's Bench in Lawrence Court House that Giovannitti wrote the first of five English prison poems which give an idea of his poetic message and of his adequacy to express that message in a language which to an Italian poet whose message was not true for all nations would be exotic:

Passed here, all wrecks from the tempestuous main  
Of life have washed the tides of time;  
Rags of bodies and souls, furies and pains,  
Horror and passions awful yet sublime,  
All passed here to their doom. Nothing remains  
Of all the tasteless dregs of sin and crime  
But stains of tears, and stains of blood, and stains  
Of the inn's vomit and the brothel's grime.  
And now we too must sit here, Joe. Don't dust  
These boards on which our wretched brothers fell.  
They're still clean; there's no reason for disgust;  
For the fat millionaire's disgusting stench  
Is not here, nor the preacher's saintly smell,  
And the judge—he never sat upon this bench.

From Lawrence jail, soon after, he wrote his indictment of the republic, which he inscribes  
"July 4—July 14":

A Goddess of the common weal.

Not hers the wisdom which decrees  
That time alone can wrongs allay.  
Not hers the craven heart to pray  
And barter Liberty for peace.

Not hers the fear to hesitate  
When shame and misery cry out:  
"Love has no patience, Truth no doubt  
And Right and Justice cannot wait."

She called . . . . .

The Mob, the mightiest judge of all,  
To hear the Rights of Man came out.  
And every word became a shout,  
And every shout a cannon ball.

And when upon the great sunrise  
Flew her disheveled victories  
To all the land and all the seas,  
Like angry eagles in the skies.

ARTURO GIOVANNITTI

To ring the call of Brotherhood  
And hail Mankind from shore to shore,  
Wrapt in her splendid tricolor,  
The People's virgin pride she stood.

This was the dawn. But when the day  
Wore out . . . . .

When night with velvet sandaled feet  
Stole in her chamber's solitude  
Behold! she lay there naked, lewd,  
A drunken harlot of the street,

With withered breasts and shaggy hair  
Solled by each wanton, frothy kiss,  
Between a sergeant of police  
And an old dribbling millionaire.

But if our nineteenth century republic has to his mind been prostituted, the Mob has in the meantime become the Thinker. In the late spring two poems on Rodin's Thinker came out almost simultaneously; one by James Oppenheim, the other by Giovannitti. They form an interesting contrast; the one filled with all the graces of style, even to the rhythm of a refrain; the other irregular in meter and almost incoherent in parts, depending for its claim to poetic excellence on the strength and daring of the thought. In contrast with Giovannitti's *Man*, in whose hand lies the making of the future, Mr. Oppenheim's *Thinker* is a musing Caliban. Here is the Oppenheim poem:

Thinks he: I come of a race of brutes,  
Tillers and killers and such:  
Whose life was a feeding, a tolling and breeding,  
And their joy was none too much.

Thinks he: our masters have given us light  
Better their rule to obey:  
Machines need brains to get good gains  
And the brutes must pass away.

Thinks he: we've paid in ages of sweat—  
Must we pay again and again?  
What if black ink shall set us to think,  
And thinking shall make us men?

Mr. Oppenheim is the reflective observer;  
Giovannitti is the apostle:

Think, think! Since time and life began  
Your mind has only feared and slept;  
Of all the beasts they called you man  
Only because you tolled and wept.

Of all the ages firmly set,  
Lone pillar of the world, you stood,  
Beyond your hunger and your sweat,  
You never knew nor understood,

Till now . . . . .

Think, think! While breaks in you the dawn,  
Crouched at your feet the world lies still.  
It has no power but your brawn,  
It has no wisdom but your will.

<sup>1</sup>See *American Magazine* for June, 1912.

Beyond your flesh and mind and blood,  
 Nothing there is to live and do.  
 There is no man, there is no God,  
 There is not anything but you.

Think, think! What every age and land  
 Thought an eternal mystery.  
 What sages could not understand,  
 And saints and poets could not see.

From you, the chained, reviled outcast,  
 From you, the brute, inert and dumb,  
 Shall, through your wakened thought, at last,  
 The message of tomorrow come.

It cometh like a flash of light,  
 Of truth to save and to redeem,  
 And, whether Love or Dynamite,  
 Shall blaze the pathway to your Dream.

The Thinker is not the only one of Giovanni's poems which suffers from defects of style. All except the Prisoner's Bench, the metrical defect in the last line of which may be intentional, have irregularities in meter as well as lapses into incoherency of expression; none is deficient in thought or the power to arouse "terror and pity."

Because it struggles with no metrical limitations, and because it expresses, as it has never been expressed in English, at once the psychology of the prisoner and the protest against the law that herds in a common jail the "apostle and the poet," together with the "hired assassin, the embezzler, the raper and the prostitute," The Walker,<sup>1</sup> written after six months in jail, is the best of Giovanni's poems.

#### THE WALKER

I hear footsteps over my head all night.

They come and they go. Again they come and again they go all night.

They come one eternity in four paces and they go one eternity in four paces, and between the coming and the going there is Silence and the Night and the Infinite.

For infinite are the nine feet of a prison cell, and endless is the march of him who walks between the yellow brick wall and the red iron gate, thinking things that cannot be chained and cannot be locked, but that wander far away in the sunlit world, in their wild pilgrimage after destined goals.

Throughout the restless night I hear the footsteps over my head.

Who walks? I do not know. It is the phantom of the jail, the sleepless brain, a man, the man, THE WALKER.

One—two—three—four: four paces and the wall.

One—two—three—four: four paces and the iron gate.

He has measured the space, he has measured it accurately, scrupulously, minutely, so many feet, so many inches, so many fractions of an inch for each of the four paces.

One—two—three—four. Each step sounds heavy and hollow over my head, and the echo of each step sounds hollow within my head as I count them in suspense and in fear that once, perhaps, in the endless walk, there may be five steps instead of four between the yellow brick wall and the red iron gate.

But he has measured the space so accurately, so scrupulously, so minutely, that nothing breaks the grave rhythm of the slow phantastic march.

When all are asleep (and who knows but I when they all sleep?) three things are still awake in the night: the Walker, my heart, and the old clock which has the soul of a fiend, for never, since a coarse hand with red hair on its fingers swung the first time the pendulum in the jail, has the old clock tick-tocked a full hour of joy.

Yet the old clock which marks everything and records everything and to everything sounds the death knell, the wise old clock that knows everything, does not know the number of the footsteps of the Walker nor the throbs of my heart.

For neither for the Walker nor for my heart is there a second, a minute, an hour, or anything that is in the old clock; there is nothing but the night, the sleepless night, and footsteps that go, and footsteps that come and the wild tumultuous beatings that trail after them forever.

• • •

All the sounds of the living beings and inanimate things, and all the voices and all the noises of the night, I have heard in my wistful vigil.

I have heard the moans of him who bewails a thing that is dead and the sighs of him who tries to smother a thing that will not die;

I have heard the stifled sobs of the one who prays with his head under the coarse blanket and the whisperings of the one who prays with his forehead on the hard cold stone of the floor;

I have heard him who laughs the shrill sinister laugh of folly at the horror rampant on the yellow wall and at the red eyes of the nightmare glaring through the iron bars;

I have heard in the sudden icy silence him who coughs a dry ringing metallic cough and wished madly that his throat would not rattle so and that he would not spit on the floor, for no sound was more atrocious than that of his sputum upon the floor;

I have heard him who swears fearsome oaths which I listen to in reverence and in awe, for they are holier than the virgin's prayer;

And I have heard, most terrible of all, the silence of two hundred brains all possessed by one single relentless unforgiving desperate thought,

All this I have heard in the watchful night,

And the murmur of the wind beyond the walls,

And the tolls of a distant bell,

And the remotest echoes of the accursed city,

And the terrible beatings, wild beatings, mad beatings of the one Heart which is nearest to my heart.

All this I have heard in the still night;

But nothing is louder, harder, drearier, mightier, more awful, than the footsteps I hear over my head all night.

Yet fearsome and terrible are all the footsteps of men upon the earth, for they either descend or climb.

They descend from little mounds and high peaks and lofty altitudes, through wide roads and narrow paths, down noble marble stairs and creaky stairs of wood, and some go down to the street, and some go down to the cellar, and some down to the pits of shame and infamy, and still some to the glory of an unfashionable abyss where there is nothing but the staring white stony eyeballs of Destiny.

And again other footsteps climb. They climb to life and to love, to fame, to power, to vanity, to truth, to glory, and to the gallows: to everything but Freedom and the Ideal.

And they all climb the same roads and the same stairs others go down; for never, since man began to think how to overcome and overpass man, have other roads and other stairs been found.

They descend and they climb, the fearful footsteps of men, and some drag, some speed, some trot, some run; the footsteps are quiet, slow, noisy, brisk, quick, feverish, mad, and most awful is their cadence to hear for the one who stands still.

<sup>1</sup>Copyright by the *International Socialist Review*.

But of all the footsteps of men that either descend or climb, no footsteps are as fearsome and terrible as those that go straight on the dead level of a prison floor from a yellow stone wall to a red iron gate.

All through the night he walks and he thinks. Is it more frightful because he walks and his footsteps sound hollow over my head, or because he thinks and does not speak?

But does he think? Why should he think? Do I think? I only hear the footsteps and count them. Four steps and the wall. Four steps and the gate. But beyond? Beyond? Where does he go beyond?

He does not go beyond. His thought breaks there on the iron gate. Perhaps it breaks like a wave of rage, perhaps like a sudden flow of hope, but it always returns to beat the wall like a billow of helplessness and despair.

He walks to and fro within the narrowness of this ever storming and furious thought. Only one thought, constant, fixed, immovable, sinister, without power and without voice.

A thought of madness, frenzy, agony, and despair, a hell-brewed thought for it is a natural thought. All things natural are things impossible so long as there are jails in the world—bread, work, happiness, peace, love.

But he does not think of this. As he walks he thinks of the most superhuman, the most unattainable, the most impossible things in the world.

He thinks of a small brass key that turns half around and throws open the iron gate.

That is all that the Walker thinks, as he walks throughout the night.

And that is what two hundred minds drowned in the darkness and the silence of the night think and that is what I think.

Wonderful is the holy wisdom of the jail that makes all think the same thought. Marvelous is the providence of the law that equalizes all even in mind and sentiment. Fallen is the last barrier of privilege, the aristocracy of the intellect. The democracy of reason has levelled all the two hundred minds to the common surface of the same thought.

I, who have never killed, think like the murderer;

I, who have never stolen, reason like the thief;

I think, reason, wish, hope, doubt, wait like the hired assassin, the embezzler, the forger, the counterfeiter, the incestuous, the raper, the prostitute, the pimp, the drunkard,—I—I who used to think of love and life and the flowers and song and beauty and the ideal.

A little key, a little key as little as my little finger, a little key of shiny brass.

All my ideas, my thoughts, my dreams are congealed in a little key of shiny brass.

All my brains, all my soul, all the suddenly surging latent powers of my life are in the pocket of a white-haired man dressed in blue.

He is powerful, great, formidable, the man with the white hair, for he has in his pocket the mighty talisman which makes one man cry and one man pray, and one laugh, and one walk, and all keep awake and think the same maddening thought.

Greater than all men is the man with the white hair and the little brass key, for no man in the world could compel two hundred men to think the same thought. Surely when the light breaks I shall write an ode, nay, a hymn, unto him, and shall hail him greater than Mohammed and Arbut and Torquemada and Mesmer, and all the other masters of other men's thoughts. I shall call him Almighty for he holds everything of all and of me in a little brass key in his pocket.

Everything of me he holds but the branding iron of contempt and the clamor of hatred for the most monstrous cabala that can make the apostle and

the murderer, the poet and the procurer, think of the same key, the same gate and the same exit on the different sunlit highways of life.

My brother, do not walk any more.

It is wrong to walk on a grave. It is a sacrilege to walk four steps from the headstone to the foot and four steps from the foot to the headstone.

If you stop walking, my brother, this will be no longer a grave; for you will give me back my mind that is chained to your feet and the right to think my own thoughts.

I implore you, my brother, for I am weary of the long vigil, weary of counting your steps and heavy with sleep.

Stop, rest, sleep, my brother, for the dawn is well nigh and it is not the key alone that can throw open the door.

How do the best lines in Reading Gaol, up to this time the best expression of prison life in English poetry, stand comparison with The Walker? Says Wilde's ballad:

But this I know, that every law,

That men have made for man.

Since first man took his brother's life,

And the sad world began,

But straws the wheat and saves the chaff

With a most evil fan.

And every prison that men build

Is built with bricks of shame.

It's only what is good in man

That wastes and withers there.

Over against these last two lines, hear The Walker, with a simplicity and melancholy iteration suggestive of Ecclesiastes:

All things natural are things impossible so long as there are jails in the world—bread, work, happiness, peace, love.

We should stop perhaps with The Walker as the climax. And yet a much inferior poem, The Bench in Mulberry Park, which has come out recently, has verses which show such a different and such an exquisite side of the poet that it should not pass unnoticed:

I dreamed and dreamed all night.

Young dreams and frail and bright,

Like little buds that never grow to bloom;

Like silver clouds that pass,

Like crickets in the grass,

Like yellow fireflies twinkling in the gloom.

Aye, I was hungry—yet

Sometimes one can forget,

And empty stomachs often find a dole,

Whilst the young days are fleet,

When one can fill with sweet,

And moonlit dreams the hunger of the soul.

For these dreams the poet had no bed but the park bench, a seat set not far from that other seat of poverty, the prisoner's bench—for each night he questioned

Whether the dawn would hail

Another thief in jail,

Or at the morgue another corpse unknown.

Surely we are not so rich in lyric poets that we can afford to send this one to the chair or keep him longer in prison.

# THE COMMON WELFARE

## NEW YORK CITY SCHOOL INQUIRY

Educators in every state who are trying to make good the faith we place in our public schools are planning to utilize the benefits of New York's \$75,000 school inquiry. This comprehensive investigation of both the business and educational methods of the greatest municipal school system of the nation is expected to reveal information applicable not only to New York's 1,000,000 children, but to the 20,000,000 others in all parts of the country. For this reason school superintendents, principals, teachers and citizens have long been waiting for the full report of the investigators.

The delay in its anticipated publication has given rise to a number of unfortunate rumors. One of these declares that the findings are being held back for various mysterious and underhand reasons. Another insinuates that the investigation was bungled and that it is petering out.

The decision of the Board of Estimate and Apportionment to reject in full the report of Prof. Ernest C. Moore, one of the Hanus investigators, on the organization and methods of the Board of Education should clear the air, particularly as it partially explains these rumors. The explanation given for this drastic action was the alleged absence in Professor Moore's report of any evidence to back up the statements he made. In his answer Professor Moore accuses the Board of Estimate of trying to rewrite his re-

port and challenges the board to bring suit for the recovery of the money paid to him.

News articles in the New York papers have complicated the situation by actually, though probably unintentionally in most cases, misleading some into believing that part of the results of the inquiry into the educational work of the school system had been released. This has made the public restless to know why the reports were not ready for distribution, especially as few fully understand all the ramifications of the inquiry.

Two years ago Mayor Gaynor appointed three members of the Board of Estimate and Apportionment to examine the organization, equipment and methods, both financial and educational, of the Board of Education. The educational part of this inquiry, as distinct from the financial and business methods, has been carried on under the immediate supervision of Prof. Paul Hanus, who divided the field up among half a score of helpers. This inquiry has largely centered on the following: the practicability of intermediate schools; part time, promotion and retardation; the size of sections; the work of teachers and the course of study; compulsory education; ungraded classes for the subnormal; and manual, technical, trade and vocational training.

Paralleling these pedagogic researches several have also been conducted of business policies and administrative methods. These were carried on directly by the special committee of the Board of Estimate and have embraced among

#### UNDERGROUND DANGERS TO HEALTH

The arrows on the left under the barn and on the right under the privy vault show polluted matter seeping down through the surface soils and crevices in the rocks into the well. This formed part of the exhibit of the United States Public Health Service at the Congress of Hygiene and Demography at Washington. The picture tells a story which would help along a sanitary revolution if it could be shown in every county seat in the United States.

other subjects the following: heating and ventilation; janitor service; sites; the bureau of supplies; the need of additional school facilities, and the wider use of the school plant.

Full reports and summaries of some of these last named have been published. None of the Hanus studies of the educational work of the schools, however, has been released, although a few of them were completed nearly three months ago. This is because it was decided to print all of the reports simultaneously. A number are still being revised, but the active field work was finished July 1. Despite the fact that the various reports on educational methods have not been made public, more than a month ago an alleged summary of the main points raised by Jesse D. Burks, director of the Philadelphia Bureau of Municipal Research, in his report to Hanus on compulsory education was featured in one of the papers. Intimations of the character of the findings of some of the other investigators have also appeared. These garbled and disconnected accounts have led to misunderstandings.

Since July when the work of the Hanus investigators was officially concluded, Frank P. Bachman, who was one of the staff, has been retained directly by the special committee of the Board of Estimate to follow up and supplement the work of the educational inquiry. In this capacity and not as one of Professor Hanus' assistants, Mr. Bachman has made a report which shows that in counting over-age children, the New York school report omits 20,000 children in special classes for over-age, plus many who drop out before the day when the records are taken. When this report appeared in the newspapers many thought it was part of the Hanus findings.

W. A. Averill, whose services were loaned by the Bureau of Municipal Research, has submitted to the Board of Estimate a report on the office methods of the city and associate superintendents. This is part of the separate inquiry into the business methods of the school board. In it he declares that clerical routine work consumes altogether too much of the time of the superintendent and his associates to the necessary neglect of supervisory educational work. He makes certain suggestions for the handling of correspondence such as a greater use of the printed forms and the establishment of an information bureau.

In a third report Charles E. Armstrong, a consulting engineer engaged by the Board of Estimate, urged the centralization of boiler plants, the installation of apparatus which will permit the use of a cheaper grade of coal, the provision of proper air washing apparatus, the use of modern vacuum cleaning systems and an improved personnel of the inspecting and supervising corps. He also submitted recommendations in regard to fire protection and possible economies in the cost of electric light. The character of some of the graver conditions disclosed may be judged from the fact that although concentration of steam producing apparatus is recognized as being good economy some of the schools had as many as six separate boiler plants.

These reports, together with a very short summary of one by E. W. Stewart on the accounting system of the bureau of supplies, comprise the main results up to date of the New York school inquiry into educational and financial methods. The twelve special Hanus reports of the pedagogical aspects of the school system are not expected to be ready for public distribution for at least another month. Additional reports on the business and administrative methods are also still to be released. Not until all these have been published can educators appraise the results of the most comprehensive school inquiry ever conducted in this country.

## EUGENICS AND EVERYDAY LIFE

A school which aims to give to the teacher, the parent and the social worker a practical ground-work in eugenics has been opened in Boston. The school is an outgrowth of lecture courses which have been offered in various parts of New England during the last five years. As over four hundred lectures were given during that period, to groups of women and girls numbering as many in a single week as fifteen hundred, the promoters feel that their Boston plan has passed the stage of an experiment.

Winter courses are offered in eugenics and eugenics; in family traits and in biology of nutrition and reproduction, by Evangeline W. Young; in genealogy, by Mary Lovering Holman, and sex in religion, by Constance M. McGinley. The general purposes of the school, headquarters of which are at 585 Boylston Street, are stated by the secretary, Cornelia B. Rodman, to be, to "arouse family pride through the study of family history, to remove the ignorance and superstition which at present shrouds the subject of sex and reproduction, to dignify the function of parenthood in the estimation of both men and women, and to warn against race-poisons and false traditions and practices which have come about by ignorance of nature's laws governing the function of race-production."

## THE TRIAL OF THE PITTSBURGH DIRECTORS

John M. Morin, director of the Pittsburgh Department of Public Safety, was found guilty October 24 by the Pittsburgh council, in a public vote of 5 to 4, of the charge of mismanagement of office brought against him by the Voters' League. He was acquitted by a vote of 6 to 3 on a companion charge of malfeasance in office. The action does not oust him, as Mayor Magee's probable veto will require six votes to be overridden, and none of the four councilmen who voted to acquit Morin on both charges is likely to change his mind. Morin is a candidate on both Republican and Progressive tickets for Pennsylvania congressman-at-large.

Joseph G. Armstrong, director of the Pittsburgh Department of Public Works, tried by the council on charges also brought by the Voters' League, was unanimously acquitted on both charges, but a number of councilmen in explaining their votes expressed the conviction that the trial and investigation of the director's office will result in greatly increased efficiency in his department.

When the test came, the only surprise was that Councilman W. G. Wilkins, a consulting engineer, rather than W. A. Hoeveler, voted to convict Morin on one count. E. V. Babcock, a

millionaire lumberman; P. J. McArdle, former president of the Amalgamated Association of Iron and Steel Workers, and Dr. J. P. Kerr, a South Side physician, voted for the exoneration of both men. Their stand was not at all unexpected and is ascribed to their political connections and ambitions. With these three, it was thought, Wilkins, who has been friendly with Mayor Magee, would stand rather than Hoeveler.

Equally expected was the stand taken by another trio, Enoch Rauh, Robert Garland and Dr. S. S. Woodburn, in voting for the conviction of Morin on both charges. John M. Goehring, president of council, like Wilkins, voted to acquit Morin on the charge of malfeasance in office and to convict him of mismanagement of office.

Dr. E. R. Walters, director of the Department of Public Health, whose trial was postponed in September when he contracted smallpox, was an interested listener as each councilman made a public explanation in casting his vote in the two cases. The time for the commencement of the Walters' trial has not been fixed.

The cases against the three Pittsburgh directors were started early in the spring when Attorney A. Leo Weil, president of the Voters' League, presented the charges to council. Amendments to the city charter, secured from the legislature in 1909, under which Pittsburgh was given a body of nine men elected at large, provided that the council, sitting as a jury with a member of the common pleas bench as judge, should try a department director accused of mismanagement or malfeasance.

The responsibility for taking action lay in reality on council, and it was the disinclination of this body to act which forced the Voters' League on to the position of prosecution. Specifications were ordered filed in May by Judge Robert Fraser. This order tended to handicap the case against Morin in particular, as it was realized that witnesses, who were part of the life of the underworld, would disappear if specifications were given on certain counts. A number of charges were therefore dropped. That the fear was not groundless was shown when during the progress of the Morin case witnesses disappeared over-night.

Director Armstrong's hearing consumed three weeks in June and that of his colleague an equal length of time in July. The difference in the attitude of the two defendants was characterized in the public explanation made by Councilman Rauh in casting his vote to convict Morin on both charges. He said that Morin, instead of acting like a public official should who was blameless, had, with the assistance of his counsel, thrown every possible obstacle in the way and taken advantage of every technicality so as

to withhold information. He said that Morin, on the stand in rebuttal, had been asked only such questions by his counsel as dealt with unimportant matters so that in cross examination the prosecution could not ask questions having to do with vital points. He said further that the record of the Morals Efficiency Commission in pointing out to the police over 100 places in the past four months proved that the director of the department was not and is not "onto his job." Like President Goehring and other councilmen who voted for conviction, Mr. Rauh laid special stress on the fact that Morin overruled the findings of the police trial board and retained on the force flagrant and repeated offenders.

None of the councilmen attacked the purposes of Mr. Weil and the Voters' League. Even among those voting for the exoneration of both directors, some spoke of the increased efficiency which had resulted and would develop from the thorough investigation and probing.

#### DR. CARREL AND THE SPAN OF LIFE

The boundary of experiment in the prolonging of life has been pushed forward another degree. Such at least was the feeling expressed by many of those attending the meeting of the New York Physicians' Association, at which Dr. Alexis Carrel, of Rockefeller Institute, who a few days before had received the Nobel prize for research in medicine, told of his most recent experiment. To quote from the *New York Times*:

"He had succeeded in separating from the body and brain and nervous system of a warm-body animal that animal's heart, stomach, liver, intestines, kidney, and bladder, and of having those organs live and functionate under his eyes for ten hours. As the culmination of many weary months of progressive experimentation, Dr. Carrel had before him in his laboratory a living 'visceral being,' living though totally severed and apart from the brain that was supposed to be the essential stimulus of life. There, under the very eyes of the eager wonderworker, was a dog's heart beating its 120 beats a minute, just as though nothing had happened, a dog's stomach digesting food as though the brain were in its seat directing the whole operation, a dog's intestines and kidneys functioning as though the surgeon's knife had never been near. This was the achievement—an entire system of organs alive outside the body, an animal killed and its viscera living.

"The announcement of it recalled that striking sentence in Dr. Carrel's paper on 'Preservation of Tissues and Its Application in Surgery,' read by him before the American Medical Association in June. The sentence was:

"If it were possible to transplant immediately after death the tissues and organs which compose the body into other identical organisms, no

elemental death would occur and all the constituent parts of the body would continue to live."

"The organs of the animal which continued to live for ten hours in Dr. Carrel's laboratory were taken by him and placed in the solution which a very infinity of experiments had taught him was the one required. The blood had to be aerated continuously by the artificial respiration supplied from oxygen pumps and the desired temperature was maintained through the laboratory equipment much as it is preserved in an incubator.

"Then Dr. Carrel watched while the organs continued the placid performance of their functions. The thing that riveted the attention of every doctor there on Thursday night was the promise the announcement implied that they and all their profession would henceforth be able to see the organs of circulation and digestion at work. After his speech was over they were all talking of the wonderful value of the achievement in the possibilities it opened up for physiological research. To be able to bend over and watch a living heart beating and a living stomach digesting—that was the wonder of it.

"Many of them looked upon it as a step in the prolongation of life."

The separation and survival of this "visceral being" has been another step in a direction in which Dr. Carrel has been moving for several years. The awarding to him of the Nobel prize came as the result of a long line of investigations since he became a member of the staff of the Rockefeller Institute, a striking climax in which was reached with the announcement last spring that he had succeeded in keeping the heart tissue of a chicken alive for a period of 120 days after removal from the body.

Dr. Carrel started on this line of experimentation in his quest of a method of storing tissues extirpated from the amputated limb of a living animal or a fresh cadaver during the period which elapsed between their extirpation and their transplantation on the patient.

"It would be very convenient," he said in Atlantic City last June, "for surgeons to keep in store pieces of skin, cartilage, blood vessels, peritoneum, bone, blood vessels, omentum, and fat ready to be used. I attempted to preserve the tissue outside of the organism in a condition of active or latent life.

"The color and consistency of the tissues remained generally normal for several weeks. After six, seven or even ten months the microscopical appearance of the arteries was not markedly modified.

"The results obtained by Tuffler, Magitot and myself demonstrate that human tissues preserved in cold storage could be used in human surgery. Future investigations will show in what measure tissues of infants should be employed as grafts.

The tissues actually used in human surgery, as cartilage, periosteum, skin and aponeuroses could easily be taken in large quantities from the fresh cadavers of fetuses and infants and preserved in vaseline and in cold storage.

"A supply of tissues in latent life would be constantly ready for use, and the tubes containing the tissues could even be sent in small refrigerators of the type of the thermos bottle to surgeons who needed them. It would simplify very much transplantation of skin, bone, periosteum and aponeuroses which are more and more used in human surgery."

#### MEDICAL EXPERTS ON HOSPITAL PROBLEMS

In opening the recent annual conference of the American Hospital Association, the mayor of Detroit remarked that his city was producing automobiles at the rate of one every fifty-five seconds. At the end of the conference a member of the association remarked that in comparison with the rate at which ideas were poured forth in discussion the automobile industry of Detroit appeared to be a very slow affair indeed.

To some of the members of the association the prominence given to social service aspects of hospital work seemed, in advance of the meeting, disproportionate to the need; many easterners take social service departments of hospitals for granted. But the wisdom of bringing this subject once more into the foreground, even if there was no new development of theory or practice to report or propose, was shown when Mr. Udell, secretary of the Detroit Associated Charities, declared that not a single hospital in Detroit had yet inaugurated a social service department.

Dr. R. R. Ross of Buffalo urged the importance of making proper provision for the extensive use of salvarsan in hospitals, notwithstanding the cost of this modern treatment. The rule of the hospitals of the country in relation to syphilis appears to be in most instances to ignore the disease entirely. The representative of a large municipal hospital in the South told of the introduction of salvarsan in his institution, and of the subsequent adoption of a rule restricting this treatment to patients who were able to pay—a noteworthy example of a principle of administration which, in the opinion of many present in Detroit, directly contradicts the fundamental purpose and duty of organized medical charities. One man asked: "If the use of salvarsan is to be prohibited because of its cost, why perform expensive surgical operations for the relief of the poor?"

The report of the Committee on the Training of Nurses presented by Miss E. A. Anderson of Boston, together with a paper by Mrs. E. G.

Fournier of Canada, on the grading of nurses, led to the appointment of a committee of five which is to spend the coming year studying that subject. The grading of nurses is proposed not merely for the protection of the public, but also with a view to the formulation and adoption of definite standards of preliminary education, and more especially of professional training, for all classes of nurses and of attendants on the sick. The work of this committee is in line with the efforts which the New York State Education Department is making, and, in fact, with a movement for the systematization of nurse training which has now become almost national in scope. Upon the completion of the proposed report it will be interesting to compare the conclusions of this committee of hospital superintendents with those of educational authorities whose analysis of the subject proceeds from an entirely different starting-point.

A resolution unanimously adopted, provided for the appointment of a committee to study and report next year on the responsibility of hospitals for the prevention of disease. Not only will this subject be examined but an effort will be made to induce hospitals to enter into more active co-operation with the public health authorities, and perhaps to extend their own work into the field of medical sociology wherever it appears that the hospital is the agency best fitted to ascertain medical facts of social importance and to lead the way in the adoption of measures for the protection of the public health.

#### A Y. M. C. A. DIVISION FOR SOCIAL SERVICE

The student department of the International Committee of the Young Men's Christian Association has established a Social Service division of its work with headquarters at 124 East 28th street, New York. Richard H. Edwards, formerly of Madison, Wis., has been engaged as senior secretary, and associated with him will be A. M. Trawick of Nashville, Tenn., and M. J. Exner, formerly of Shanghai, China.

What this new division will mean to the cause of social service in American college and university life is thus described by the student department: "It is a definite enlargement both of the message and the program of the student associations. The secretaries of the new divisions contemplate a production of text books for the study of social questions especially adapted to college and university students, an increase in the number of social service addresses to be given in educational institutions by leading social workers and others under association auspices, the formation of 'community interest' or 'social problems groups,' enlargement of voluntary social service in connection with established agencies

in college communities, the recruiting of a large number of college men for professional social service and the general incorporation into all association work of social service ideals and methods."

Mr. Edwards has been closely identified with the progressive group at the Wisconsin capital. For six years he has been the Congregational University pastor representing the Congregational Churches of Wisconsin at the university, and also a member of the staff of the Extension Division of the University as editor of *Studies in Social Problems*. He has established a series of seven studies in American Social Conditions for use in groups for the study of social problems following the method which he outlined in *THE SURVEY* in 1908.<sup>1</sup>

For three years Mr. Exner was director of physical education in Shanghai, China, where he entered upon a new program of hygiene and health for China. He will devote his attention primarily to a careful study of the problem of sex education in the colleges of North America. Mr. Trawick has been associated for two years with the student department in an effort to arouse college students to a study of the problems of Negro life in the South.

#### BAY STATE LAWS AND THE FAMILY

It is not often that social legislation is analyzed and classified from the point of its effect on the family. We are accustomed to thinking in terms of hours, of health and community welfare. This is what gave Joseph Lee's review of Massachusetts legislation at the National Conference of Charities and Correction last spring its distinction, for he tabbed up things "for and against the family." The way he did it may be suggestive to those in other states who are advising social legislation the coming winter. Said Mr. Lee:

"Some things have been done for and against the family. For the family, we have a state-wide housing agitation, two steps in which have been gained this year: (1) A permissive law allowing towns to adopt what housing regulations they think best—local option in this respect; (2) a model law for towns with a referendum—putting it in one pill as it were—so they can adopt it all at once. The advantage of this model law is that the towns will be likely to take it, so we shall have one law instead of three hundred. It is a way of saving the sanity of courts and architects.

"Against the family, there have been several bills for free feeding of school children, one of which passed the House and was defeated in the Senate only by a tie vote. Our playground referendum law, putting it up to towns, whether or not they will have a playground, has been ex-

tended from places of 10,000 down to those of 5,000 inhabitants. The Norfolk State Hospital for hopeful inebriates has received its first appropriation. It will, when completed, include also a thousand-acre colony for resigned inebriates—a storage proposition.

"One Boston school committee has made a concerted attack on bad teeth, the essential features of which are the exaltation of the toothbrush and concentrating on the first grade; the momentous time with teeth being the coming of the sixth-year molar.

"A resolution for the study of the minimum wage question was passed, but we still have tariff protection on goods and free trade in labor.

"On the most important proposition of all—who gets born—last year Governor Foss vetoed an increased appropriation for our second school for the feeble-minded. This year, however, provision was made for two new cottages, which will hold two hundred inmates and cut off by perhaps half that number the source of supply of the unhappy and unfit among future generations.

"The righteous have sworn the segregation of all the feeble-minded for 1925."

#### CRUSADING IN INDIANA

That a conference of social workers may be something more than an occasion for making and hearing speeches was shown the other day when members of the Indiana Housing Association, the only state housing association in the country, armed themselves with notebooks and pencils and went out to see the poorer sections of Logansport's residence quarters. Pencil and pad were for the purpose of jotting down names of landlords and street numbers of houses. A permanent record will be kept of both houses and landlords that were not living up to their jobs. What was seen was made the subject of discussion that evening, and so another city was awakened to a knowledge of conditions which it did not suppose existed.

This is but one of the ways in which campaigns for better housing are conducted in Indiana. Two representatives of the State Board of Health were on hand to pledge themselves and their associates to a movement which, they declared, would not stop until dark rooms and unsanitary dwellings had been forgotten and the tuberculosis caused by them had become a thing of the past. Indiana housing reformers are planning to write a new law on their statute books next winter and they have agreed among themselves that information about actual conditions is the best argument with which to convince the legislative mind. Thus it is that Indiana towns during the past few years have known something of the sensation of being gone over with a fine tooth comb.

It was not unfitting that in a year when the state Conference of Charities and Correction,

<sup>1</sup>See *THE SURVEY*, October 17, 1908, p. 103.

meeting at the same time and place, was to be presided over by a woman, the burden of the discussion should have been, better care for the state's wards. Emma Lee Elam, president, stood forth as a strong advocate of special homes for dependent children. Governor Marshall was present during the arguments for colony care of the insane, and it was not without a note of triumph that Amos W. Butler later read a telegram from the governor announcing that the State Board of Finance had made available a conditional appropriation passed by the last general assembly and that this action definitely assured a colony for insane patients in Indiana. The first one will be opened in connection with the Eastern Hospital for the Insane at Richmond, option on the land being already taken.

How to co-operate with state officers, shown by the presence of representatives of the Board of Health and the governor, was further exemplified when Senator Netterville, chairman of the legislative commission on a state farm, pledged his support to the attempt to establish a penal farm in Indiana.

Foes and friends of "funds for parents" acts did not shrink from counting hands to determine which side was in the majority. At a meeting of the State Children's Bureau arguments pro and con were listened to and a ballot was called resulting in 9 affirmative and 12 negative votes on the question whether such a policy should be favored.

A state playground commission was formed to promote the playground propaganda throughout Indiana. This commission will have as one of its duties distribution of literature issued in connection with an extension course in social work now being prepared by Prof. U. G. Weatherly, of Indiana University.

One trend of opinion was illustrated when Alexander Johnson, general secretary of the National Conference of Charities and Correction, who has consistently opposed the Indiana plan of sterilizing criminals and defectives, because he believes its tendencies are immoral and degrading, declared that he had now come to support that policy so far as it applies to the feeble-minded. Recent investigations, he said, had disclosed the existence of such an enormous number of mental defectives that with all the dangerous possibilities of sterilization he could see no other practicable way to stem the tide of degeneracy.

#### AVONDALE, A MILL VILLAGE

In the village of Avondale, Ala., a suburb of the Birmingham district which closely adjoins an old-style cotton mill owned and operated by former Governor B. B. Comer, regenerative processes have been going on for several months.

Shortly after the Birmingham number of *THE SURVEY*<sup>1</sup> came out, with its description of unsuitable moral conditions in the mill neighborhoods, the Wesley House Association and the mill management took active steps to correct some of the more obvious evils. The home mission societies of the Methodist church maintain this settlement, which was removed from its old location near Elyton, where its work did not have wide scope, to the mill village. Mr. Comer gave the association two houses, \$50 per month and various perquisites. A nursery, kindergarten, cooking and sewing circles and social clubs for boys and girls have been established. In one quarter of the mill village, much work has been done where there existed the row of houses known as "Hell's Half Acre." Here more than one young girl, broken down from mill work, has found disastrous end.

In addition to the incoming of Wesley house, the latest step is a plan to establish a co-operative boarding house for girls and young women on the mill property. The Tennessee Coal, Iron and Railroad Company has employed two people to carry on social service activities at their mining camps on Red Mountain and in the coal fields.

### THE PITTSBURGH UNDER WORLD AT BAY

RABBI RUDOLPH I. COFFEE  
Member Morals Efficiency Commission, Pittsburgh

Within the past six months, Pittsburgh has emerged from a moral crusade with gratifying results. The first week in May the twelve members of the Morals Efficiency Commission, appointed by Mayor William A. Magee, took office and straightway planned for the betterment of local conditions. To quote from the evidence produced at the trial of John M. Morin, director of public safety, approximately \$1,700,000 was the price of protection said to have been paid by illegal resorts of all kinds, and 197 disorderly houses had been opened in the past three years. These were in addition to eighty-four old houses. Scattered in various parts of the city, many of them were in the very heart of crowded residential sections. The sale of liquor was open and all sorts of amusements were conducted.

The members of the commission are practically unanimous in believing that the only solution is elimination. They feel, however, that the time is not yet ripe for this, and so the goal has become ultimate elimination by gradual restriction. The commission has no direct power, but the police department has thus far carried out

<sup>1</sup>See *THE SURVEY* for January 6, 1912.

every suggestion. These recommendations to the police have been along two lines. The commission holds that the way to eradicate prostitution is to destroy its profits and shut off its sources of supply. By driving out the exploiters of the unfortunate women and by protecting the young from contamination it is believed the illicit traffic will soon be lessened. To hasten this, many humane repressive measures have been enforced by the police. Liquor has been banished from all resorts, music is no more heard, dances and shows are of the past, clandestine places are raided as fast as they are found, the masher and street walker exist only at their peril, exorbitant profits of real estate owners, who rent their property for immoral purposes, are undergoing a severe shrinkage. The cafés of the city have been cleared of minors, and hotels no longer receive couples without baggage.

In the second place, without legally recognizing the illicit traffic, a rigid medical inspection has been instituted. Every house must furnish weekly a medical certificate from each inmate, stating that a microscopic test has been made by a reputable physician. There are no favored doctors, and severe sanitary rules have been prescribed for every house. The inmates have cooperated heartily in these recommendations, understanding their value. Peddlers and agents are denied admission, and the women may purchase wherever they wish. They are urged to open individual bank accounts, and promised aid if they desire to leave their surroundings and reform. Some have already done so, and many have returned to their former homes. A serious difficulty facing the commission is the effort to find places for those desiring to lead honorable lives.

As a result of this campaign, at the end of six months, about 150 houses have been permanently closed. The business is no longer profitable, and others are closing voluntarily, one having been closed by the sheriff, the first instance of such a thing in this county. Over twenty streets have been cleansed entirely, including Colwell Street, infamous for fifty years, as well as Poplar Alley and Cherry Alley, where the houses were supposed to enjoy special political protection. Every known assignation house has been blotted out, and efforts are now progressing to prevent a return to the loose and immoral era of the past.

Such drastic measures could not have been put into operation without incurring the wrath of the underworld. The parties engaged in this nefarious traffic bided their time, and raised a great cry when Rose Drew (an assumed name) was taken from a disorderly house and sent by the commission to the Home of the Good Shepherd. Some newspapers aided the

agitation, lawyers were engaged and a writ of habeas corpus was made returnable on October 5. The girl was brought into court, and told the judge she was of age and very willingly went to the home, whereupon the case was dismissed. A police captain that morning said that in his twenty years' experience he had never seen so many denizens of the lower world in court at one time. Baffled in this encounter, they came before City Council and petitioned that the commission be abolished because of its illegal use of authority. After an afternoon of testimony, their petition was cast aside, and the commission will now continue its activities. This opposition quickly cemented the forces for good in the city and they hastened to the support of the commission. The Pittsburgh ministers, by a unanimous vote, indorsed the work, and sent a special committee to appear before council.

After all, what has been done is purely remedial. The aim of all legislation should be to prevent this evil. Therefore, the commission aims to direct the community away from this source of corruption. It seeks to introduce such instruction in the school course as will inform growing children of the dangers of this evil. The active support of Pittsburgh's ministers has been enlisted, and this winter it is hoped that legislation from Harrisburg will compel a doctor's certificate before marriage may be solemnized.

## PAY ROLLS AND PROFITS

MARY W. DEWSON

Secretary Massachusetts Commission on  
Minimum Wage Boards

"Interstate competition makes a local minimum wage law impractical. It places an unfair handicap on the local manufacturer. If he must pay more for his labor than his competitors he will be forced out of business or to move into another state, where he will be unhampered." So, last winter, argued the opponents to the plans of the Massachusetts Commission on Minimum Wage Boards.

There are familiar answers to this argument. Higher pay to those who earn starvation wages would mean more efficient workers, and any state gains through the loss of industries which exploit their workers to such an extent. True answers, but the kind of generalizations from which a clever attorney can take the starch, even though the truth remains. But there is one irrefutable reply. Today, if it were but known, rival employers in a common labor market do not pay the same price for their labor, and the man who pays on the higher scale is not forced out of business.

Employers assume that they pay the same. Jenkins says that he pays from \$4 to \$8 for his

candy workers and Jones says that he pays from \$4 to \$8 for his. In fact, they may pay for each ten of their girls as follows:

JENKINS'S PAYROLL.			JONES'S PAYROLL.		
No. of girls.	Weekly pay.	Total amt. paid.	No. of girls.	Weekly pay.	Total amt. paid.
1	\$4	\$4	4	\$4	\$16
1	\$5	\$5	2	\$5	\$10
2	\$6	\$12	2	\$6	\$12
2	\$7	\$14	1	\$7	\$7
4	\$8	\$32	1	\$8	\$8
10	—	\$67	10	—	\$53

It is not quite clear why Jenkins pays higher wages. It is a question whether he himself is aware that he does. From my experience an employer rarely knows how many employes he has at each rate. He is hazy as to what the individual earns. One employer confessed that he knew that Jennie and Annie were paid \$8 a week and that until he looked into it he thought that \$8 was the usual pay. In fact, Jennie and Annie were his two old star hands, and the rest received various amounts less than \$8. Occasionally an employer was found who had studied his payroll and who paid higher wages because he thought it was good business. There were others who seemed consciously to grind down their help, either to keep the business afloat by making up from the pay of the workers what was lost by poor management or to fatten profits at the expense of the workers. All of the employers knew their total labor cost, but the question of the individual's wages was left to the under man who had charge of the help.

The books of fifty-seven candy factories, laundries, and retail stores were studied by the investigators of the commission, and the result showed that no principle nor tendency, either according to the size of the establishments, their location, or the class of trade to which they catered underlay the variations in wage scales. For two instances among many, a factory that made a cheaper grade of candy paid higher wages than its neighbor, which received a better rate for its product; and a department store in a small city paid higher wages than many Boston stores. In the laundries were similar discrepancies. Every employer seemed to pay for his labor what he thought "it was worth," a mysterious term that no employer was able to elucidate.

The report of the commission gives separately the wage scale of each of the fifty-seven establishments. The investigators took from the books the entire amount of the earnings of each and every woman during the previous fifty-two weeks. They showed, for example, that out of every hundred women in candy factory No. 5, 46.9 earned on the average throughout the past year less than \$4 a week; 21.9 women, between \$4 and \$5; 18.7 women earned more than \$5, but less than \$6, and the remaining 3.1 women earned \$8 or over. But in competing candy factory No. 4 out of every hundred women only 16.1 were

paid on the average throughout that year less than \$4 a week (a much better showing than in factory No. 5); 36.7 women earned between \$4 and \$5; 20.9 women earned more than \$5 but less than \$6; 10.8 women earned between \$6 and \$7; 8.8 women between \$7 and \$8; and 7.7 women \$8 or over (again a much better showing than in No. 5, where none were paid between \$7 and \$8, and only 3.1 over \$8).

Six of the big Boston department stores showed significant difference in wage scales:

PER CENT OF WOMEN EMPLOYED.	EARNINGS			
	Under \$4.	From \$4 to \$5.99.	From \$6 to \$7.99.	\$8 and over.
Boston Store.				
No. 1.	1.0	18.6	22.7	57.7
No. 2.	10.1	4.3	78.1	17.5
No. 3.	22.0	20.4	30.9	26.7
No. 4.	4.8	31.9	34.5	28.8
No. 5.	24.2	24.7	22	29.1
No. 6.	14.8	51.7	20.5	13

There is not room to give typical figures from the laundries. They also make plain that the main factor in the pay roll of the individual establishment is not the labor market.

To go back to the case of Jenkins and Jones, if a minimum wage of \$6 was established in their state it would add to Jenkins's payroll at the rate of \$3 a week for every ten women employed, and to Jones's at the rate of \$10 a week. In other words, Jenkins would have to increase his pay roll 4 per cent and Jones 19 per cent. Jenkins would not go out of business or leave the state. Would Jones? But, on the other hand, what is the matter with Jones that he cannot make money under a minimum wage law when Jenkins can? Is it the cost of labor? Apparently not. Is it bad management or something else that has nothing to do with wages except in so far as wages affect efficiency?

## OCTAVIA HILL

C. S. LOCH<sup>1</sup>

Secretary London Charity Organisation Society

To many who knew her the death of Octavia Hill is like the withdrawal of a light in the path of their daily life. A great faith possessed her, a full assurance that the good and courageous in our nature, if we give it ample space in our hearts and true recognition by our acts and deeds, will justify itself in fact. Many say this as a half-belief or expect that it should be assumed. With her it was real, and one could hardly be in her presence without feeling it. In this way she was to many as a light, a strong personality, a rare and beautiful character, moved by deep sympathy and guided by a very direct and discerning sagacity.

What she did in the commencement of her work in "dealing with house property," as people now say, she did by this simple directness. The problem was the dirty house, the dirty and ir-

<sup>1</sup>Reprinted from the *London Charity Organisation Review* for September.

regular tenant, arrears of rent, insanitation and general deterioration. She solved it, not by trying to get sanitary and other laws enforced or by taking partial action of some kind, but by dealing with all parts of the difficulty together. With Ruskin's help in the first instance, she raised the money to purchase some dirty and dilapidated houses and made herself their landlady and thus mistress of the whole position. She could then by degrees introduce the many little arrangements that bettered the home life, all settled in detail, directly, family by family, and thus in the process, not of building a new house but of adapting and improving an old one; another process went on, not of finding new tenants for reformed houses but of adapting and adjusting the family life of the tenant to the changes of the gradually altered tenement. And this directness of insight and action she applied to many schemes and proposals. What progress meant among the poor and very poor her experience had taught her. She knew the conditions of it. If a scheme would not draw out the strength of the people it was clearly dubitable and was probably bad. That was the final test. Would the poor prosper the better for it, be more independent, better able to judge of life and its responsibilities—in a word, be better housekeepers and so better citizens?

She had begun to work early in life. She knew that duty was exacting, and that only through the fulfilment of duty could any advance be made. She knew that life could not be satisfied with bread alone, that it was many-sided, and that progress could only come by a recognition of this. The man, the wife, and the children, their dwelling, their habits, and their pleasures must move up together. Not a single line, but the net of duty must draw them to a better and completer life. When she became rent-collector and landlady, the children, she saw, wanted places in which to play, the workman and his wife a clean home and, as far as might be, some place or park to which he and his family might resort. So, as she says in one of her books published long since, as the owner of houses in a court which she was making better-mannered, she wanted the children to play real games and find pleasure in something more than the mere shouting of silly and unmeaning and sometimes ill-meaning words. And for children and grown-up alike she wished other thoughts and desires than the familiar thoughts and desires of poor London courts. Thus many and many a party of tenants went down into the country for the day and received the hospitality of her friends, and thus had an outing in good humor and pleasure without resort to public-houses. And the large open space which we call the country did its part of purification by its gift of new thoughts and the suggestion of new pos-

sibilities. If any of our readers have read so old a book as *Tom Brown at Oxford*, written by Miss Hill's friend, Tom Hughes, they will remember that the hero by his new interests in London was drawn into helping to take charge of complex parties of men and women such as these. And for the aged she wanted quiet corners close at hand.

Open spaces such as she desired the public might, she thought, provide by voluntary contributions or, especially in the case of very large areas, such, for instance, as the Epping Forest, by voluntary contributions in part, in part by grants from local municipal authorities. All shared alike in the benefits of this spending, and public help was thus well justified; and in the acquisition of large areas that would be of service to large masses of Londoners she and those who worked with her frequently suggested this distribution of the burden of purchase. But though open spaces were so great a boon and almost a necessity, first of all came duty. The punctual payment of rent, the acceptance of the obligations of life, and cleanliness were the necessary beginnings of a better civilization.

Thus out of the first houses and the suggestions that came to her in their management, all the rest followed. Very much, as I believe, from her original initiation city cemeteries became gardens, and large spaces—field and heath and parklike stretches of land—were secured to the public use, where thousands go now on a holiday. In the same spirit she urged the preservation of commons and pathways, and then the gift or purchase of places of natural beauty and houses of old and beautiful structure, to be held in trust lest the careless and crowding generations of the future might forget and sacrifice to private gain or to the casual needs of the passing day what should be kept for the general good forever.

In this large and ample spirit she suggested her great scheme of a circle of open spaces all around London, sward and trees, where one could have the pleasure of walking on grass under the lights and shadows of leafage. Such a scheme at one time, she thought, the London County Council might have carried out. Akin to it was the scheme which she had very much at heart during the past year and more, the preservation of the banks of the Wandle, the beautiful stream which runs from Carshalton and Beddington to Merton and Mitcham and Wimbledon—the beautiful stream sullied and spoilt, of the higher waters of which Ruskin wrote in 1870 in the introduction of *The Crown of Wild Olives*:

"No clearer or diviner waters ever sang with constant lips of the hand which 'giveth rain from heaven'; no pasture ever lightened the spring-time with more passionate blossoming; no

sweeter homes ever hallowed the heart of the passer-by with their pride of peaceful gladness—fain hidden yet full confessed.”

In these waters, he says, the foulness of street and house, heaps of dust and slime and broken shards of old metal and rags of putrid clothes had been thrown, and no one cared. “Half-a-dozen men with one day’s work could cleanse these pools and trim the flowers about their banks and make every breath of summer air above them rich with cool balm, and every glittering wave medicinal, as if it ran troubled only by angels from the porch of Bethesda. But that day’s work is never given, nor, I suppose, will be; nor will any joy be possible to heart of man for evermore about these wells of English water.”

But days of work have now been given, and change has already been made in the lower waters of the Wandle. Fields and frontages on this stream, in its course nearer to London, have, through the advocacy of Miss Hill and her friends, some been given, some purchased, so that the stream is giving to the large population which is now so close to its banks something of the pleasure of earlier years—the pleasure of clean gliding water and green meadows and trees. There the children bathe and play, and what we call “the country” lies before all who may come to it for the joy “possible to the heart of man.” Perhaps there could be no better memorial of Octavia Hill than the restitution of the Wandle, the Wandle running clear in open meadows from Carshalton down to Wimbledon. One day we remember last summer when, with the map of the river before her, she explained to us as we sat under the trees what pieces of land were purchased or given, what was purchasable, what was first of all desired, and so on, with a childlike pleasure in every circumstance, as if, from having seen how people were enjoying the banks and fields already open to them, she saw that a multitude would enjoy them in the future, sitting and wandering and playing there.

Miss Hill’s method of caring for the dwellings of the poor—house and tenant together—has been widely adopted. She became the trusted rent-collector and adviser of the Ecclesiastical Commission in regard to their property in South London, and her system will be continued by the commission, who are placing its administration in the hands of those who were trained by her and worked under her there. The thought that her work would have this continuity and permanence was a very great satisfaction and relief to her. In Edinburgh the municipality built dwellings and at first had them managed by lady collectors on Miss Hill’s lines. Then they reverted to the collection of rents by the usual collectors. But the outcome was a triumph for

her method. So great was the confusion and the maltreatment of the property by the tenants that the lady collectors were invited to return to their work, the efficiency of which is now fully acknowledged. At the last Charity Organisation conference—that at Manchester—Mr. Nettlefold, discussing the question of dwellings as a past member of the Birmingham Municipal Council, fully accepted and strongly advocated the view that the normal method of advance should be to consider tenant and tenement together; not to make great and expensive clearances, but to require of owners certain definite and reasonable sanitary alterations and the preservation of the house in good and tenable repair. This was the method now accepted in Birmingham, and it was justified on the score both of public health and of public economy. And to mention one other instance, a short time ago Miss Hill’s advice was asked in regard to some house property which had reverted to the owner at the end of a long lease. It had been terribly neglected and misused, but it had been substantially built. It was proposed to clear the site and build new dwellings, a costly and doubtful investment, especially in view of the lessened value of much house property in London; and she advised what years before she herself had done in Marylebone. The property accordingly was repaired and made sanitary and “managed.” This proved to be the truer reform. No large new dwellings were erected to house new residents at higher rates, but the people on the spot stepped into the repaired and reorganized buildings.

The first Artisans’ Dwelling Act was very largely promoted by the Charity Organisation Society, in which she was an active worker and of which she has always been a whole-hearted supporter. That act first gave effective powers for dealing with congested areas of bad dwellings. Its principles have since been expanded and its methods simplified. It placed a new and, as it turned out, a costly instrument in the hands of the local authority, and it has been widely applied. Clearance of itself must to some extent be a benefit. It always at least necessitates the break-up of old courts and the broadening and realignment of streets. Then follows usually the building of large high dwellings which supersede the small houses of an older date. But this process, it is found, does not supply the needs of the local people. They disperse while the clearances are made and the new buildings erected. A new population gathers to tenant the new dwellings and take advantage of the improvements. Miss Hill saw this process of large and indiscriminate clearance go on with very much regret. She was always for more constant, continuous, and less wholesale and compulsory changes. Her recognition of the unity of the

life of the house and the tenant drew her to other methods. But that was not the only question. An immense advance in the housing of the poorer classes in London had been made by the industrial building societies or companies, which had been able to raise and use a considerable capital for the purpose. They bought their land and built their dwellings in the open market as ordinary traders. Similarly private persons with a fair prospect of a normal return for their money bought bad houses and repaired them and managed them on her lines. The advent of the municipality in the field greatly altered these conditions. They cleared and built at the cost of the rates. The charges for the land were written down to an estimated cost at artisans' dwelling values, and the rigid conditions of the market and the strict requirements of a management that would produce a profit on the total outlay were set aside. With such a policy no independent agency could compete. The companies ceased to raise capital and to extend, and private individuals found investment on the terms of improvement less and less profitable, and eventually practically unproductive. Statutory action had brought with it an unforeseen reaction, as often happens. The use of the public rates as capital had stopped the use of that large and easily available capital which lay in the hands of the vast body of private individuals. Orderly, businesslike progress, in which the greatest number of people would have had a direct and abiding personal interest, was checked. One chief condition of Miss Hill's method was overlooked and lost, personal interest and management joined to an adherence to the rules of private business. One wonders what might have happened if the County Council had understood Miss Hill's policy and slowly and persistently promoted it. How much higher would have been the civilization of London now, how much fewer would have been its lofty dwellings, how much fewer would have been its black spots? It was, so it seems to me, a great chance in great measure lost, a great failure in insight and intelligence on the part of our public authorities. The results we see in the London of today.

In this way, then, the position has developed in regard to the dwellings of the poor. The wisdom of Miss Hill's policy has been proved over and over again. And recently those who followed her, with the help of herself and her friends, have been applying her plans in certain bad districts with marked results. Some have taken houses in deteriorating and retrograde areas, and are thus raising the level of life and its obligations in them; and no sooner is the business once undertaken than, as she found in Marylebone, one task leads to another, the provision of open spaces, the stoppage of the illegal use of public-houses, the purgation, if it be pos-

sible, of the "furnished rooms," the starting of homely clubs—all the tasks indeed by the fulfilment of which the upward movement to self-restraint and civilization may make its way. And so we would go on, as she would have done, to strengthen the best elements in the area, enforce and help forward the best local opinion, give the good and respectable the best chance of asserting themselves, and so sift out, if it may be, the dirt and the vice and the pollution, and give good soil and opportunity for the stronger life and its influences to grow and to spread out.

Miss Hill had the ability, as was once said of her, of a first-rate man of business. She had the management of large properties and many banking accounts. Her knowledge of rates and rate collection and the variations of local administration in that department was surprisingly wide and exact. She was very thoughtful and considerate, and, as I have said, direct in her methods. She learnt the facts for herself, and aided by a strong memory and much knowledge of the human nature with which in her life she had been so constantly dealing, her rightness of judgment and her power of leadership were extraordinary, talents very finely perfected and very nobly applied. She lived a very active life, but she lived very quietly. She wrote for the Charity Organisation Society a charming occasional paper on the management of the homes of the poor; and I think that her description of the superintending lady collector might almost apply to herself.

"One needs," she said, "a certain quiet temper suitable for one whose duty is management. . . . The manager should be always thinking what will make the house and people better and yet be quite indifferent to mere popularity. She must be ready to do stern things, because she sees beyond them to the blessings they will bring.

"In fact, whatever would make a lady a wise head of a house will help to make her a wise head of houses. . . .

"It is on this wise government by one lady as head that all the work depends."

Her sympathy was a deep, not a superficial, sympathy. The still waters ran deep. But how intense was her feeling, her words now and then would vibrate and flash to you, as once when she was reading a paper and referred to the maxim of the Charity Organisation Society that the poor should be thoroughly helped. "A very difficult business," so began the phrase, from which an intensity of meaning seemed to pass out; "a very difficult business which calls for all the best powers of heart and soul and head." Such to her was the obligation of social service in charity organization. All her qualities, indeed, and all her endeavors, were lit up, so it always seemed to me, by her splendid faith in goodness and courage.

## THE TREND OF THINGS

### LEADERS IN THE MONTH'S MAGAZINES

**THROUGH THE WINDOWS OF DESTINY: HOW I VISUALIZED MY LIFE WORK.** By Kate Barnard. *Good Housekeeping*. Easily the most important article of the month in the social field. An inspired and simple story by a woman who, as commissioner of charities in Oklahoma, has proven herself a force for moral and material betterment in the West.

**THE DRAMA OF WAGES.** By Mary Field. *American Magazine*. A series of pictures from real life, showing, among other things, what an increase in wages means in the satisfaction of individual ideals, great or small, and what the lower levels of wages mean in individual degradation.

**CLIMBING OUT THROUGH MUSIC.** By Constance D. Leupp. *Outlook*.—How the Music School Settlement of New York has set itself the task of bringing back to the people the gift given by "King Admetus' shepherd," but long since stolen by the "kings of the earth."

**YOU AND GRADE CROSSINGS.** By Edward Lyell Fox. *Pearson's*. Puts the blame for the fact that "because an inconceivable number of railroads cross a grade in this country, there is Death," on the apathy of a public that does not bolster up the hands of state and interstate railroad commissions in making regulations that would cut the railroad accident rate one-fifth.

**INDUSTRIAL WAR.** By Hugh H. Lusk. *Forum*. The remedy for this civil warfare is, thinks this former New Zealand legislator, not the minimum wage, but labor co-partnership by law, a remedy much discussed in England, but appearing now for the first time in an American periodical.

**THE NEARLY TRUE STORY OF LITTLE JOE.** By H. J. Smith. *Metropolitan*. A delightful piece of propaganda for manual training, especially that form of manual training installed in the Gary schools by a "grim-mouthed young man named William A. Wirt," whose appearance belied his nature as, in the literal sense, a "pedagogue."

**THE BATTLE LINE OF LABOR.** By Samuel P. Orth. *World's Work*. How lines are drawn in warfare which is fought at the public's expense. Later articles promise to show, not how the conflict can be ended, for this the writer deems impossible, but how the public can umpire the game and in self-protection impose fines and penalties on those who break the rules it lays down.

**LLOYD-GEORGE'S ENGLAND.** By Clarence Poe. *World's Work*. Not only plans and principles, but some results of social legislation in England, vividly told.

**SANITARY AUTHORITIES AND THE INSURANCE ACT.** By B. G. Bannington. *Westminster Review* (October). The medical provisions of the British Act, which are designed to "render disease less dangerous, health more perfect, life more vigorous and death more remote."

**IS THE NEGRO HAVING A FAIR CHANCE?** By Booker T. Washington. *Century*. Weighing unequal laws and justice by no means impartial against greater economic opportunity, Mr. Washington holds that the Negro is better off in America than in other countries; and in the South, where there is a "job looking for each man," than in the North, where two or three men are after each job.

"WE know," says Kate Barnard in *Good Housekeeping*, "that the present treatment of the criminal problem is a failure from its conception, and will continue to be. It is as if we had about us a noisome marsh, bubbling up from the bottom with all manner of foul miasma and spreading contagion throughout the land. But we make no attempt to drain the marsh; we are content with trying to skim off the bubbles and scum as they rapidly rise to the surface."

\* \* \*

"THE essentially weak feature of a court, or a commission, of arbitration," argues Mr. Lusk, writing on Industrial War in the *Forum*, "must always be that it is a tribunal of opinion. If its members belong to one part of the community they will necessarily, and with perfect sincerity, lean to the opinions of the class to which they belong; and all experience has shown that the class of a majority of the court or commission will not be that of the workers."

"It is very likely that the idea of an arbitration court for the settlement of industrial disputes in England has been imported from New Zealand or Australia, where the idea has been tried for some time. If this is the case, it would seem to show that the experience of that part of the world has been misunderstood. In New Zealand, it is true, the system of arbitration by a court, which is so far compulsory that it applies to all unions, whether of workers or employers, that have voluntarily accepted it by registration under the statute, has been in force for more than sixteen years, with excellent results. In Australia, on the other hand, where the law was made compulsory in its application to all industrial bodies, without reference to their acceptance of its provisions, it has been at least comparatively a failure. Strikes and lock-outs have been forbidden in Australia for the last ten years under severe pains and penalties, and yet there have been serious strikes, especially of coal miners, every two or three years. The reason given in each case for the defiance of the law has been the want of confidence of the workers in the impartiality of the court. How far this has been warranted may be questioned; the fact that it exists is certain, and has proved fatal to the system, as an adequate cure for the evil. The experience of Australia would certainly be repeated on a larger and if possible a more dangerous scale, either in England or America."

\* \* \*

THE Music School Settlement has its own plan to bring about universal disarmament. So writes Constance D. Leupp in the *Outlook*:

As you watch and listen, you find that you are growing strangely excited and moved—moved as you have never been by the masterly touch of professional talent. It is not merely because these young people play classical music with such astonishing ability and appreciation; their poise and their response to the masterpiece they are interpret-

ing sits oddly with their manifestly normal youth. But the significance of Sunday mornings at the Music School Settlement goes far beyond that. Your imagination is caught and held captive as you begin to notice the individual performers and the national traits they display, for a dozen races have contributed to the able group before you; here, if anywhere, is the love-feast of the nations of the world. . . .

You note with pride that the girl *Concertmeister* is unmistakably an American. Behind her sits a blue-eyed, flaxen-haired boy from the plains of Saxony; there are two Russian 'cellists, a boy and a girl, while among the second violins is a Pole, next an Austrian, then an Italian and a Bohemian. Whatever may prevail outside, no race antagonism finds its way into the school.

\* \* \*

**I**N the contrast of two related families Mary Field, in the *American Magazine*, portrays what a few dollars more or less mean. Of a young Italian woman she asks:

"And what did you do with the three-dollar raise?"

"Well, sir, I chucked them three dollars extra in the bank! Ain't I seen how sickness comes on, and how mens is laid off, and how you starve and worry! I'm used to livin' on twelve dollars in four little rooms, but say, I ain't used to no bank account!"

It was not alone for herself that Mrs. Petroni spoke but for large numbers of her people who, like herself, had just come out of great tribulation. In the first months and even years of a higher wage, excessive, niggardly thrift often makes inroads into real economy, and a foreshortened vision distorts future value.

"What does your father get?"

"Say, he's a cheap skate for fair! Don't get but eight, nine dollars a week. You can't raise your American kids on that! Come over to ma's, across the street."

"Ma" was home, stirring a macaroni soup. Wages! There was the whole story in contrast! In place of the bareness and order of Mrs. Petroni's was the filth, the accumulation, the chaos of Mrs. Torsetti's. A smell, thick, indescribable, drenched the place. A litter of children swarmed over the floor.

"Oh, for the land's sake, mother," scolded the daughter, "get something decent to eat!" Then turning to me: "They raises Italian kids on macaroni and sour wine. I have meat and milk. It's healthier! Saves on the doctor!"

Mrs. Petroni, with the privilege of a married daughter, scolded on. "For Heaven's sake, ma, why don't you wash yourself up! You look fierce! And the kids! My God!"

Mrs. Torsetti, who had remained silent, stirring her soup like an uncanny old witch, suddenly burst into a volcano of language. "She says how she can keep clean without

soap!" interpreted the daughter with a hard, bitter laugh. "She says folks must wash themselves with money. That it ain't brooms you sweep with, it's money. That's no joke!"

The ancient Mrs. Torsetti ended the tirade with a snivel and wiped her eyes and nose on her skirt and the soup spoon.

"Lord! Come! Don't stay here!" Mrs. Petroni rushed to the door. "It makes me sick, it does, and yet what you going to do with no money!"

Outside on the street she rattled on, her dark eyes ablaze with indignant passion. "They say that Italian girls are goin' to the bad in America! Do you wonder! In Italy girls and fellers marry when they're young. In this here country, a feller's got to wait till his wages is good and steady. And what's a girl goin' to do meantime? Set in a punk house like that without pleasures, or marry someone your father says and get a lot of kids like I done to get out of it! American streets is better'n Italian houses, believe me!"

\* \* \*

**B**OOKER T. WASHINGTON, in the *Century*, finds a black republic in some respects more civilized than a white. To quote:

In the island of Jamaica there are about 15,000 white people and 600,000 black people, but of the "race problem," in regard to which there is much agitation in this country, one hears almost nothing there. Jamaica has neither mobs, race riots, lynchings, nor burnings, such as disgrace our civilization. In that country there is likewise no bitterness between white man and black man. One reason for this is that the laws are conceived and executed with exact and absolute justice, without regard to race or color.

Reduced to its lowest terms, the fact is that a large part of our racial troubles in the United States grow out of some attempt to pass and execute a law that will make and keep one man superior to another, whether he is intrinsically superior or not. No greater harm can be done to any group of people than to let them feel that a statutory enactment can keep them superior to anybody else.

\* \* \*

**I**N the *Metropolitan* H. J. Smith tells the "nearly true story" of Little Joe's first year in school. It is the story of the vocational training system at Gary which bids fair to give that town a greater claim on public recognition than the steel mills or the drama of its growth. By the end of six months Mr. Smith records that:

J. Negoski, Jr., stood nil in reading, next to nil in arithmetic, but one hundred per cent plus in manual training. He had made three boxes and begun a chair. A few months more, and Joe's chairs were pronounced perfect. In all else, as regretfully recorded, he lagged; and yet they could see

that, bit by bit, as his sleeping mind awakened in the warmth of something it liked, it absorbed other things, too. Clear enough that from the viewpoint, of Gary education, Little Joe would come out an educated boy. That is, there would be one thing he could do supremely well; while as to the other things, he would have enough of them to get along with. In fine, he would be as good as any of us B. A. folks, and maybe better.

Gradually a great change came over Little Joe. At home he was no longer under his mother's feet or on his father's nerves. A placid light came into his eyes. Big Joe mentioned this to Mama, and noticed too the way the boy's body was filling out. Sometimes of an evening Steven, whose nature was jovial and uncreative, would find Little Joe drawing on paper. One night after Joe had gone to bed Steven gathered up the paper and saw a queer combination of lines, not unlike a rough design for a school desk.

\* \* \*

ON successive evenings during the political campaign THE SURVEY was cited before great audiences as non-partisan evidence. At one meeting the presidential candidate on one national ticket was the speaker—Theodore Roosevelt, and at the next the vice-presidential candidate on another—Governor Thomas R. Marshall.

\* \* \*

BOYS' LIFE has been purchased by the Boy Scouts of America and has become their national organ under the name of the *Boy Scouts' Magazine*. Among the contributing editors are Ernest Thompson Seton, Daniel Carter Beard, Gifford Pinchot and Theodore Roosevelt—all scouts. The address is the headquarters of the Boy Scouts, 200 Fifth Avenue, New York.

Painted by Charles A. Winter for the Coming Nation.

## THE WORKER

BY BERTON BRALEY

I have broken my hands on your granite,  
I have broken my strength on your steel,  
I have sweated through years for your pleasure,  
I have worked like a slave for your wealth,  
And what is the wage you have paid me?  
You masters and drivers of men—  
Enough so I come in my hunger  
To beg for more labor again!

I have given my manhood to serve you,  
I have given my gladness and youth;  
You have used me, and spent me; and crushed me,  
And thrown me aside without ruth;  
You have shut my eyes off from the sunlight,  
My lungs from the untainted air,  
You have housed me in horrible places  
Surrounded by squalor and care.

I have built you the world in its beauty,  
I have brought you the glory and spoil,  
You have blighted my sons and my daughters,  
You have scourged me again to my toil,  
Yet I suffer it all in my patience,  
For somehow I duly have known  
That some day the Worker will conquer  
In a world that was meant for his own!

"YOU yourself," says Pearson's in summarizing E. L. Fox's article on grade crossings, "you yourself are responsible for the grade crossings which needlessly kill one thousand people a year and endanger your own life every time you cross a railroad track. You are responsible. More than 20 per cent of railroad accidents are due to grade crossings. You are responsible. Engineers can plan safe crossings before tracks are laid. They do not do it because it would cost money to do it. They will not do it until public opinion makes them do it. Harmful conditions exist only because of public thoughtlessness. Most railroad commissions have no authority in the matter of grade crossings. Here's why: 'The matter of grade crossings has never been discussed in any way to attract public attention.'"

\* \* \*

## THE WOMEN OF THE SHAWLS

SHAEMAS O'SHEEL in the Forum

By my windows, which look out  
On a polite and pleasant street,  
There often pass  
Women of the dingy quarter down the hill;  
Creatures of primary faith and primitive doubt,  
Brief love and narrow faith and small deceit,  
Brief sleep, long toll, a roof, a rag, and meat,  
Patience beneath unrealized defeat,—  
Mortgaged too deep to Fate, alas!  
To leave much scope for will.  
And they are slow and large and ponderous,  
And are not beautiful as all women should be,  
And under Life's incessant mockery  
That by which woman chiefly is beauteous,  
Wonder and sweet illusion has quite gone.  
And like a burdened river they move on,  
With no complaint, no choice, no change, no thrill,  
Brown clods with so much muscle, so much nerve,  
A womb and two breasts each, who still must serve  
As Fate directs, until  
Fate bids them be quite still—  
I fancy they are placid when they go.  
And so  
They pass, each folded in a sullen shawl,  
Death's forward symbol, Life's ironic pall.

**DIVISION OF A  
FAMILY INCOME  
OF \$900 TO  
\$1,000**

The *Ladies' Home Journal* thus graphically represents Prof. R. C. Chapin's division of a family income of \$900 to \$1,000. The percentages are: food 44.7; rent 19; clothing 14.6; sundries 9.9; fuel and light 5.1; insurance 2.6; doctor 2.6; carfare 1.5.

**T**HE *Buffalo Express* publishes the following protest of a lodge of the International Association of Machinists against the proposed establishment of an army post in Buffalo:

Whereas, The establishment of an army post in this city has a tendency to establish murderous ideals in the breasts of our children and expose hundreds of our girls annually to be sacrificed to the lust of the soldiery, and

Whereas, The establishment of an army post will be used against the working class by arrogant and bullying employers whenever a body of workmen or women seek to secure from organized capital that which justly belongs to them. Be it therefore

Resolved, That we protest vigorously against the establishment of such post in order that the higher ideals in life may be promoted.

The *Express* believes that these resolutions are not consistent with true Americanism.

\* \* \*

**T**HE Chamber of Commerce of the United States, organized last spring with H. A. Wheeler of Chicago as president, has begun the publication of an official organ, the *Nation's Business*. This periodical, one aim of which is to secure publicity for the work of the chamber and which is distributed free to newspapers, is "intended to furnish a survey of the constructive

progress of the nation along lines of agriculture, mining, manufacture, transportation, distribution and finance. It will be devoted to the news of progress and organized promotion, and will include statistical statements of development and cover the bureaus of the government departments that are related to business and commercial activities at home and abroad.

The "nation's business," according to an editorial in the first issue of this publication, is "summed up in three productive lines—agriculture, mining and manufacturing; in three distributive lines—transportation, distribution and finance, and in various activities dependent upon production and distribution—education, the professions, governmental life, altruistic service and the like.

"The nation's business is to believe that all who render service are entitled to reward, and to implant the element of hope and courage in every human being who, in his place, is doing his duty well."

#### THE DIFFERENCE

Street Car Driver—Me and that off horse has been working for the company for twelve years now.

Passenger—That so? The company must think a great deal of you both.

Street Car Driver—Wall, I dunno; last week the two of us was taken sick and they got a doctor for the horse and docked me. Gid-up there, now, Betsey.—*New York Tribune*.

## PERSONALS

Near the close of the year 1912 it was discovered for the first time why kitchen sinks are built so low that all women who wash dishes must suffer three backaches a day and nag their husbands to try boarding. The remedy was simple—raise the sinks. But the reason why sinks are low was tucked obscurely away in the minds of male persons who do not wash dishes. It all came out, and the reform movement for lengthening sink legs was successfully launched, as a result of the housing reform movement.

It was this way.

The housing reform movement gathered momentum and published reports and accomplished great things for some twenty years, under the direction of men and of women who had help in their kitchens. By that time, 1912, it had hooked on fire escapes, prescribed cubic air space and attended to all the structural and scientific points of tenement houses, so that the men who had started it no longer made inspections (only speeches) and turned over the field work to women. The women, one in particular, Madge D. Headley, looked on a tenement with the eyes of a woman, and saw it as a possible home. Miss Headley saw that the sink of the model tenement in the twentieth century is as low as the ancestral sink of the nineteenth, over which she had leaned and ached. The tenement women confessed that their backs ached in spite of the cubic air space. The 30 per cent of unoccupied lot area gave no relief. Even the bathtub did not help, for that was lower still. Evidently the housing reform movement had slipped on this little detail.

So Miss Headley, who was in particular pursuit of plumbing anyway, went to a manufacturer of sinks.

"Why are sinks made so low that they give women backaches three times a day?" she asked him.

"Sinks are the same height they always have been," said he, just like that.

"But why have they always been the same height?"

"I'm blessed if I know," he confessed, though he had been making them just that height since before Miss Headley was born.

Thereupon he set out to find the reason, and was a long time about it. Traced back to its beginning, the length of sink legs appears to have been set for a good reason and continued for none. All porcelain and metal sinks, he found, are the same height and have been since iron sink No. 1 was made. And No. 1 was the same height as the wooden sinks it succeeded. There the trail ended, but finally the sink man figured it out.

The wooden sink was built in the days when dishwashing and such tasks were done in wooden tubs and buckets with high sides, so that a low sink was comfortable to work over. Moreover, it was before the time of running water, the tubs and buckets were heavy, and the lower the sink the less the lift. When faucets and

shallow vessels came in, the sink still scrooched down by the floor. No sink maker ever had to use one, so there it stayed, though if he had ever thought about it he would have seen that the basins in which he washed his hands at his club and in his own bathroom were just as uncomfortably low, so that he had to bend over and splash water on his cuffs.

By the time he had figured all this out, the sink man was so interested that he designed a new sink, a sort of sink on stilts or a daddy-long-legs of a sink, and in no time at all now it will be on the market for the use and easement of women.

All of which is to the everlasting credit of Miss Headley.

A. P. K.

\* \* \*

"There isn't a soul to whom I would go with more confidence if I were in trouble, or sorrow, or sin, than I would to Dr. Knight."

These words are from an old letter written in 1891 by an elderly lady who had had a full measure of life's sadness. In the twenty-one year's since then, those who knew Dr. Knight best have felt that confidence ever deepening, and when he suddenly died the other day, hundreds felt that one upon whom they had been leaning heavily had been wrenched from them.

Not only was this true of the poor unfortunates of the school for the feeble-minded of which he, and his distinguished father before him, had been the wise and efficient head, but his townspeople, his fellow members of the Connecticut legislature, the men of the state who were about to send him to Congress, the alumni of his beloved Yale, and the countless friends who recognized his sterling trustworthiness in every direction, felt that a prop was gone.

When Dr. Knight was the head of the school for the feeble-minded in Minnesota, he was the youngest superintendent of a state institution in the country. On returning to his native state, his common sense, trained intelligence, warm sympathy and immense capacity for painstaking labor, were applied successively to a series of worthy tasks—from tapping the springs to give a water supply to his village to providing suitable homes for the tuberculous of the state. A personal habit—that of silence—rendered his judgment on practical matters, always worth seeking, of still greater impressiveness because of the few words used to express it. Indeed, the only criticism ever made of him in the writer's hearing was that he was too slow to voice the interest and sympathy he felt, too expectant that his hearers would understand his almost brusque expressions.

It is delightful to see one so honored by his own townsfolk as was Dr. Knight. Though Dr. Knight was a Protestant of Protestants, the neighboring Roman Catholic priest read the prayers for the dead for his congregation when he heard that the good doctor was gone. With a voice choking with emotion he assured them that Dr. Knight needed no special preparation for death for his whole life had been a preparation. And when the doctor in his last sleep was driven

through the maple shadowed streets to the quiet cemetery it was not alone the public school children who were gathered to do him honor, but the little children of the convent school stood silently with folded hands clasping a few flowers as the slow procession passed. That would have meant more to him than that the governor of the state and a delegation of eminent citizens should have traveled many miles to pay him the last tribute of respect.

ISABEL C. BARROWS.

\* \* \*

Dr. John S. Fulton, secretary-general of the International Congress of Hygiene and Demography, insists that the ideas worked out by Mr. Brenner for the medal, described in *THE SURVEY* of October 5, were wholly the sculptor's. "Except that his conversation with me may have stimulated Mr. Brenner's imagination," says Dr. Fulton, "I contributed nothing to the form in which the idea ultimately appeared."

\* \* \*

"Bill Haywood" to the workers at Lawrence, the "unspeakable Haywood" to American industries, is the subject of some remarkably strong verses in the *International Socialist Review*, by Tom Flynn, a worker himself, whose first poem this is. The verses are in answer to a casual expression of wonder as to where Haywood got this "clear and ready speech." Was it down in the depths of the dripping mines (the verses run), where the straining timbers screech:

Or was it the roar of the fire-hung blast  
As it tore men's lives away,  
That taught you to think what a man should  
think,  
And say what a man should say?

Or maybe the yawn of the open shaft,  
Pit black as the mouth of hell,  
That taught to give you the ready speech  
They say you can use so well.

For you are only a miner, Bill,  
Did you not dig out the ore?  
So what should you know of the grace of speech  
High-sounding and rhythmic lore?

Mayhap it came in the hammer's clank,  
Or the crunch of the cutting drill,  
Or the crushing crash of the falling rocks  
That ever lurk to kill.

\* \* \*

Lillian M. Hoag has been appointed executive secretary of the newly organized Ithaca (N. Y.) Associated Charities of which T. W. Summers, general manager of the Ithaca Electric Light and Power Company, is president. Miss Hoag, originally an Ithaca woman, has spent ten years in settlement work in New York.

\* \* \*

Howell Wright, who has recently been made superintendent of the Cleveland Associated Charities, was from 1907 to 1909 special agent for the Massachusetts Society for the Prevention of Cruelty to Children. During the next two years he was agent of the same society, and in 1911 became general secretary of the Civic Association at Norwood, Mass.

## COMMUNICATIONS

### MR. GEORGE'S REASONS

#### TO THE EDITOR:

Since some of the readers of *THE SURVEY* who are not familiar with the situation may have thought it strange that William R. George, founder of the George Junior Republic at Freeville, N. Y., should have decided to reside elsewhere than at the Republic, I should like to state his reasons for this decision. Mr. George has not been officially connected with the republic at Freeville since 1908, when the National Association of Junior Republics was organized with Mr. George as national director of all the republics, of which there are now eight in six different states. Mr. George, naturally, could not continue an official connection with any one republic, any more than a federal official could at the same time hold a state office. It was Mr. George's intention to make the Freeville Republic the national headquarters of the Junior Republic movement, but time proved this plan to be inexpedient for the following reasons:

First, so long as Mr. George retained his residence at the Freeville Republic, people unfamiliar with the situation persistently affirmed that the success of the republic was due to Mr. George's personality rather than the principles underlying self-government and self-support. Mr. George desires to prove beyond the possibility of contradiction that a Junior Republic rests upon principles of immutable right, the successful working out of which is not dependent upon any one person.

In the second place, while Mr. George is on the grounds, helpers and citizens constantly turn to him for advice and counsel on all manner of matters, which he cannot well withhold, but which from time to time places him in the embarrassing position of appearing to thwart by indirection, the wishes of those locally in authority. This, as readily can be seen, is unfair both to Mr. George and to the local management.

Finally, the rapidly increasing national work, which contemplates ultimately the establishment of at least one Junior Republic in every state of the Union, makes it imperative that Mr. George should be free from the annoyance of having petty local matters continually brought to his attention, and thereby be enabled to give his entire time and energy to the larger problems of the national movement. In an unauthorized publication in the daily press the charges brought against Mr. George's character years ago and at that time proved to be absolutely unfounded and incredible were mentioned. The fact of mentioning these charges in connection with Mr. George's proposed intention to remove his home from the republic at Freeville naturally gave the implication that they were in some way connected with his proposed step. Absolutely no such connection exists and this base implication is grossly unfair to Mr. George, to his associates and to the cause of which he is the leader.

With Mr. George freed from the local cares which are forced upon him under present conditions, it is expected that the national work will forge ahead faster than heretofore.

LYMAN BEECHER STOWE.

[Secretary, National Association of Junior Republics.]  
New York.

## STEERAGE: OUT-BOUND

TO THE EDITOR:

Returning to the United States this summer on the French Line I took the opportunity of looking over the steerage conditions. I can thoroughly bear out what Dr. von Borosini has said concerning the conditions there.<sup>1</sup> The quarters devoted to the immigrants were in the after part of the ship well below the surface of the ocean and had absolutely no ventilation either through port holes or through ventilators.

There were three large rooms where I should say, roughly, there were from fifty to seventy-five beds (so-called) in each. The rooms were used indiscriminately by men and by women. The beds (so-called) were merely strips of canvas slung between iron posts. A pair of dirty blankets were the only other articles of bed clothing. The rooms were dirty and there was a rough bench along one side of each of them which was used for eating purposes. As to the quality and quantity of food I am not informed. The toilets were in a most disgusting condition.

## THE BOSTON RAILWAY STRIKE

TO THE EDITOR:

IN THE SURVEY of August 31 is an article which deals with the recent strike on the Boston Elevated Railway system was that men had been strike is concerned, it gives the labor union view of the matter so exclusively that though I have no interest in the railway company, I feel impelled as a matter of fair play to make some comments.

In the first place, the question arises—was the strike justifiable, carrying with it as it did such an interference with public safety and public convenience? The road was giving good service and it was conceded that conditions and pay were good. Whatever causes of complaint there were could not have been of importance as a large number of employes were satisfied and disapproved of the strike and remained loyal to the company. The strike was to get a share in the control of the road and to compel unwilling men to join the union. It was accompanied by numerous acts of violence, to none of which the article alludes. The strikers inflicted much injury on innocent persons. The company found men willing to work and had restored its service to almost normal conditions when the labor leaders who had hitherto ignored the Board of Conciliation, finding themselves in danger of defeat, appealed to the governor and district-

attorney to assist them. This is an election period, and they found the two rival candidates most sympathetic. The district attorney wrote in a letter of "the intolerable conditions of the road." If there was anything intolerable, it must have been occasioned by the strikers. The Board of Conciliation was brought forward. Its decision in favor of the strikers was received by the public with great surprise, a surprise that deepened into amazement when the district attorney advocated dismissing practically all the charges against the men whom the courts had held for acts of violence. Added to this, the Board of Conciliation decided that all strikers should be put back in their old positions and often over the heads of the loyal men who had stood by the company at the risk of their lives. The charge by the counsel for the union that officials of the company had been guilty of conspiracy to induce vicious characters to come to the city and of conspiring to incite riots is too absurd to have been put forward save as a lawyer's bluff. No one who knows anything of the character of the president and directors of the elevated road would believe it for a moment.

The article speaks of the public being on the side of the strikers. I believe the public thought the railway company within its rights. Those persons with whom I have come in contact think it has been unjustly treated and I have heard of nothing but sympathy for the loyal men who have been ignored and forced to join the union. One thing more: The railway company is held responsible for the safety of the public. That being the case, it should have the power of enforcing discipline. Why should it be compelled to share its authority with an organization which claims the right to interfere with this discipline, yet evades all responsibility for results?

Boston.

FRANCIS P. SPRAGUE.

TO THE EDITOR:

The grievance of the strikers on the Boston Elevated Railway system was that men had been discharged for joining a union. The contention of the men was not for recognition of the union (though incidentally that was won) but for the right to belong to a union. To laboring men this right is vital and fundamental. It may seem trivial to Mr. Sprague, but it is essential to right living and well-ordered freedom. It is to be regretted that Mr. Sprague impugns the motives of the governor, the mayor and the prosecuting attorney, but as they are politicians they must have acted, conscientiously or otherwise, in response to public opinion. If, as Mr. Sprague says, they were "most sympathetic," this would contradict that part of Mr. Sprague's criticism which claims that public thought was with the railway company. The Massachusetts Board of Conciliation and Arbitration has never before, I think, been charged with being biased in favor of strikers.

## EUGENICS AND FATHERHOOD

TO THE EDITOR:

I cannot understand why any man prefers to be the son of a healthy criminal, rather than to be the son of a consumptive bishop.<sup>1</sup> Why should a depraved brain and heart be preferred to a depraved lung and circulation? We at least know that tuberculosis is caused by a parasite that science is learning to control; as yet science is in the dark as to the cure of the criminal brain or whatever part of the organism is at fault. If eugenics is to bless the world it will have to be through better reasoning helpers than S. G. Smith. I once heard a very thoughtful thinker on man and life assert that the children of real love on the part of both parents were known to be far ahead of other children in health and morals. Eugenics may have a deeper study ahead than the making of a perfect body through the laws of bodily health. Such has not proven always satisfactory, even in the animal kingdom.

Truth of purpose in marriage; quietness and consideration given to bearing woman; love and common-sense freedom given the child; sufficient rest for the life-producing father, coupled with right love between the parents for each other and for their children, and I doubt if many eugenic congresses would be needed to help the world.

Nature has nothing to be ashamed of, and when all that concerns our bodies is treated and talked of in a rational way; when false modesty takes a back seat, then child-bearing will be the one interesting subject.

MADGE E. ANDERSON.

San Diego, Cal.

## DUTCH DUTCHMEN

TO THE EDITOR:

In *THE SURVEY* for September 14, I find an article with the heading Ohio's Debt to a Common Dutchman (page 745) on which I should like to comment.

It is rather disconcerting to both the Dutch and German to find periodicals of good standing making mistakes which neither of the two above mentioned races like. The German is not a Dutchman, and the Dutchman (Hollander) does not like to have the Germans called Dutchmen. I presume the word or name as understood here is a degenerate form from the word *Deutschman*.

It is somewhat difficult, when one is a Dutchman, to know whether you are received as a German or *vice versa*. I wonder whether some effort could not be made through such journals as *THE SURVEY* to correct this small but nevertheless irritating matter. The Flying Dutchman is not a German—nor is the "Dutchman and his beer" a Dutchman. Perhaps you will assist the writer.

A DUTCHMAN.

Cambridge, Mass.

<sup>1</sup>See *THE SURVEY*, Sept. 21, 1912, page 753.

## JOTTINGS

## RECEIVING HOMES FOR FOUNDLINGS

Because the change in ways of caring for foundlings calls for a radical change in institutions for them, the Department of Child Helping of the Russell Sage Foundation has issued a leaflet diagraming and describing the new type of receiving home for foundlings, which it declares has in recent years largely displaced the old type of foundling asylum. This, says the leaflet, "admitted only foundlings; that is, such babies as were actually found by the police. Later, these asylums admitted many babies brought by their mothers who said they could not keep their babies. In more recent years the institutions have admitted a few mothers with their babies, but now this type of foundling asylum is giving place to temporary receiving homes into which mothers who might otherwise abandon their babies are received with them." These receiving homes are used as temporary quarters until mothers and babies have been placed out in private families, a practice that has grown of late and that is said to effect a greatly reduced mortality rate among foundlings.

A building blocked out by the Russell Sage Foundation is designed to exhibit the chief sanitary features which the medical profession recognize as essential in saving the lives and improving the vitality of babies who must have temporary institutional care.

## PITTSBURGH HUNGRY CLUB

As a forum for the free discussion of municipal, social and political problems, the Hungry Club of Pittsburgh occupies a unique position as it begins its fifth year. This informal weekly luncheon organization includes in its regular attendance city officials and employees, social workers and many prominent business and professional men. No votes are taken and speakers are free to express their convictions as strongly as they please. Speakers of prominence are readily secured, and their subjects cover a wide range. The program for the first four weeks of the current year included Councilman Robert Garland who spoke on The Tariff and Taft; James E. West, New York, on What Boy Scouts Do; President J. W. Kline, International Brotherhood of Blacksmiths, Indianapolis, on Labor Unions and Politics; Mayor William A. Magee, on The Pending Bond Issue.

## COURSE ON COST OF LIVING

A course on prices and the cost of living is being given this year at the University of Wisconsin. The new course, which is in charge of Prof. R. H. Hess, is concerned with a detailed study of prices and marketing conditions in the United States during the last twenty years. How the middleman takes the profit from the producer will be one of the interesting things brought out.

A JOURNAL OF CONSTRUCTIVE PHILANTHROPY

## THE PITH OF IT

**L**AST summer four baby hearses were counted within a single block going to a cemetery in Montreal. When the Child Welfare Exhibition burrowed down beneath the surface of things a few weeks later one of the revelations was that every fourth child born died in infancy. P. 195.

**I**NFANT mortality in the United States is to be one of the first subjects investigated by the new Federal Children's Bureau. The collation of all existing material relating to children will be another immediate task, says the bureau's first bulletin. P. 189.

**T**HE need of a children's bureau, international in scope and organization, is now being discussed. The suggestion comes from Europe. P. 190.

**B**OOKS on various phases of child care continue to make this year distinctive. With reviews of five of these THE SURVEY publishes also this week reviews of works in the fields of immigration, Socialism, social hygiene, city government, and apprenticeship in England. P. 203.

**C**ONTEMPORANEOUS with a great shortening of the working day in the iron and steel industry in Great Britain there has been a great increase in output. But it would not be safe, writes John A. Fitch, to assume that this would happen in the United States. There human labor does much that machinery accomplishes here and human beings, unlike machines, work most efficiently on short shifts. P. 198.

**B**Y finding some literature on tuberculosis in her father's pocket, Edith learns of the dangers to which she is exposing those she loves. She runs away to New York, for there is no sanatorium nearer. But father and lover bring her back and when her cure is complete the old home town treats itself to a brand new sanatorium of its own:—such is the story of a motion picture film released today by the National Association for the Study and Prevention of Tuberculosis. P. 190.

**R**EVERSING its own earlier position, the New York Court of Appeals has abandoned the doctrine of the assumption of risk in accident cases in which the employer can be proved to have been culpably negligent. Though a step in the right direction, this does not go far enough, says Edward T. Devine; we must get rid of the contributory negligence, assumption of risk and fellow-servant rules altogether and find a new basis for insurance or compensation laws in the inherent risks of industry. P. 193.

## THE COMMON WELFARE

### IMMEDIATE WORK OF CHILDREN'S BUREAU

The head of a bureau of the federal government is called "chief." It has become a uniform custom among government employes, when writing to such an officer, to address him as "Dear Mr. Chief." Consequently, official Washington was thrown into consternation at the announcement that Julia C. Lathrop had been placed in charge of the new children's bureau; for there seemed no escape from the salutation, "Dear Miss Chief."

That mischief is not to enter into the plans of the bureau is made clear, however, in its first official bulletin, just issued. Though the legislative, executive and judicial appropriation bill, granting funds to the bureau, did not pass until the latter part of August, the bulletin presents an impressive statement of things which will be done first, admitting that the program thus mapped out is a mere beginning. Readers are reminded that the bureau has no power to do administrative work, being able neither to make regulations concerning children nor to create institutions for them. "Its duty," the bulletin states, "is solely to study and report upon conditions affecting the welfare of children." In passing, credit for the first suggestion that a children's bureau be established is given to Lillian D. Wald, head of the Nurses' Settlement, New York.

The immediate work of the bureau, as outlined, falls into two classes: bringing together exist-

ing material within its scope and making original investigations. The United States government through various bureaus has already collected much statistical material relating to children, but it is scattered through many publications and has never been correlated by persons interested primarily in children. The bureau will bring this material together and, using it as a basis, will issue a convenient handbook of statistics on children, so that the important data which the government has compiled may be readily available for all agencies engaged in work for children.

Current literature, both in this country and abroad, the bulletin points out, is rich in matter relating to children. The office of librarian-reader has therefore been established, requiring the services of one who is not only an experienced librarian, but is also familiar with the principal modern languages and trained in sociology and economics. This, it is expected, will make it possible to select and prepare for immediate use significant material published in other countries on child problems. The United States Civil Service Commission has already announced an examination, for women only, for this position.

In the field of original investigation one of the first things the bureau plans is to study infant mortality. Not only is there declared to be urgent social need of a fuller knowledge of conditions, but such knowledge is fundamental to the later work of the bureau. The field of inquiry will be confined for the present to a few

comparatively small communities. On this point the bulletin continues:

"Because the importance of adequate birth registration in reducing infant mortality is universally recognized, the bureau will co-operate with the organizations, governmental and volunteer, now working for registration in this country. The New England states, Pennsylvania, and Michigan were in 1910 the only states included by the Census Bureau in the registration area for births as having laws for birth registration so enforced as to give reasonably satisfactory results. In most of the states births are not properly recorded, either because there is no law requiring their registration or because the existing law is inadequate or is not enforced. Unless the local social agencies working for the welfare of babies can learn of the birth of a child they can not directly help that child. Unless there can be secured reliable knowledge as to children born, there can be no reliable knowledge as to the birth rate, nor as to the proportion of children who die."

The effect of inadequate registration was forcibly seen recently in Montreal, when the city statistician had to guess as best he could on the evidence obtainable what the annual death rate of children was. His estimate was one in four.'

In carrying out what it regards as the intent of the law creating it the bureau will become a clearing house for information regarding passed or pending state legislation affecting children. It will also issue from time to time brief popular pamphlets on subjects assigned to it by law. These will be designed for wide distribution, and if necessary will be translated into foreign languages.

#### AN INTERNATIONAL BUREAU DISCUSSED

The establishment of such a bureau in this country lends interest to a meeting held some time ago at the home of Edouard Juhliet in Paris for the purpose of considering the establishment of an international children's bureau. Among those present were members of the institute, ministers of justice, lawyers and a number of distinguished students of social problems from various countries in Europe.

M. Juhliet explained that the idea was not new; that various congresses and conferences at different times had the subject under consideration, and that quite a number of persons with whom he had conferred had come to the conclusion that such a bureau could be established as early as possible; that those present, as well as a considerable number not present, had promised their co-operation. The conference determined to meet again in Brussels for the purpose of completing some plan for the creation of such a bureau.

#### FIGHTING DISEASE WITH THE MOTION PICTURE

When a motion picture company recently gave a private exhibition of the life of John Bunyan in two reels and Pilgrim's Progress in three, many people were newly impressed with the power of the cinematograph to extend both the mental and visual horizons of masses of mankind. It is just this power of enlarging the scope of observation and of vivifying the things observed that so many propagandist bodies have seized hold of to drive home facts and figures, causes, effects and remedies which to the average citizen mean little when re-enforced only by white paper and cold type. In other words a table setting forth how many cases of tuberculosis were counted last month and calculating the expense connected with any thorough attempt at

EDITH CONSULTS THE FAMILY DOCTOR

prevention would not be half so likely to open the public's purse as a dramatic reproduction of one girl's fight with the disease.

For just such a reason the New York Milk Committee pioneered in devising a motion picture play that would carry a message of hygienic living past all barriers of prejudice and indifference, and for just such a reason the National Association for the Study and Prevention of Tuberculosis is releasing on November 16 a new film to be extensively used during the next six weeks as a special feature of the Red Cross Christmas Seal sale. The scenario was written by James Oppenheim especially for the anti-tuberculosis campaign and "Hope" is the dominant note as it is the title of the theme.

The story tells of a young banker in a little New York town by the name of John Harvey and of his bookkeeper, Wells, with whose daugh-

ter Edith, Harvey is in love. A few weeks before the holiday season, Harvey one day received a letter and some literature from the National Association for the Study and Prevention of Tuberculosis, asking him to engage in a tuberculosis campaign in his district, to form a committee to sell Red Cross Christmas Seals, and to work for the erection of a local sanatorium. He shows the material to his old bookkeeper and both the men laugh at the idea that a country district need engage in such a fight. Tuberculosis, they believe, is a thing only of the city slums. Careless and unthinking, however, Wells

culosis literature in her father's pocket. As she reads of the dangers to which she is exposing those whom she loves, and of the hope of a cure that may be hers if she will go to a sanatorium, she finally conquers her immediate desire and resolves to live for health and a cure. She writes a note to her father and another to Harvey releasing him from their engagement and leaves home secretly for New York to see what chance she has of being cured, for there is no sanatorium nearer to her home than a day's journey.

It is the bitter realization of the truth that

HARVEY AND HER FATHER FIND EDITH IN A NEW YORK HALL BEDROOM

puts some of the pamphlets in his pocket and forgets the incident.

Meanwhile Edith is trying hard to conceal from her father and lover the annoying cough which she has developed and also the knowledge given to her privately by the old family physician that she has tuberculosis. She struggles hard against her love for Harvey and her father, especially when the banker shows her the new home which he is building for them. She is about resolved not to yield to the doctor's advice recommending that she go to a sanatorium, when one evening she accidentally discovers the tuber-

tuberculosis lurks everywhere, even in their own homes, that spurs Harvey and Wells to arouse their townfolk to the need of preventing this disease and erecting a sanatorium. And all the while they are searching for Edith, until one day by chance they find her name on the records of Bellevue Hospital tuberculosis clinic. They trace her to the ferryboat day camp at that institution and finally to her own miserable hall bedroom. It is not a difficult task to persuade Edith to go home and take the cure in the new sanatorium on the outskirts of the town. Here she completely recovers her health and as an indi-

EDITH ENTIRELY CURED LEAVING THE NEW SANATORIUM

cation of her future mode of life on entering her new home for the first time, a happy bride, she throws the windows wide open to let in the fresh air.

## SEX HYGIENE AND CHILDREN

It is only eight years since Dr. Prince A. Morrow started the first organized effort to secure popular discussion of venereal diseases and an understanding outside the medical profession of their causes and effects. He found *THE SURVEY* (then *Charities*) the only lay journal willing to open its columns to the demand that these diseases be dragged out into the light and that they be understood for what they are—communicable and preventable but frequently incurable.

Today the venereal diseases, the prevention of prostitution, white slavery, sex morality, a whole range of reforms conveniently grouped under the name of sex hygiene, have become subjects of constant discussion in newspaper and magazine. Pamphlets and books from reform bodies and from commercial publishers increase rapidly, and there is danger of over-doing, or badly doing, an important and delicate task.

This is particularly true of the vital preventive aspect of the movement, the teaching of sex hygiene to children. Hence the importance of an authoritative report on it by a joint committee of the American Society of Sanitary

and Moral Prophylaxis and the American Federation of Sex Hygiene, both of which were represented on the committee by Dr. Morrow; the New York Association of Biology Teachers, represented by Professor Bigelow, and the School of Pedagogy represented by Prof. Thomas M. Balliet.

The gist of the report is that sex hygiene is a matter of both hygiene and ethics. The facts taught come from the scientists (hygienists and biologists), but the motive, at all ages and under all circumstances, must be ethical. No lower motive will do. It is right and necessary to pass and enforce laws against vice, to equip hospitals for venereal cases, to protect and rescue girls, to put a fear of the Great Black Plague into the minds of young men. But the only way to win the fight is to make every boy and girl understand the reason for sex, appreciate sex morality and have a chivalrous regard for women.

"Sex hygiene has a purely practical aim and should be strictly limited by this aim," says the report. Other scientific subjects are taught in a way to stimulate interest, but here the purpose is to satisfy the degree of curiosity spontaneously aroused at any age, with just enough more to protect the child from the temptations sure to come to him. Physiological age groups, beginning before the kindergarten, are set up, the points of emphasis at each age noted, and a brief schedule given of the steps in biology for each group to study, ranging from flowers and in-

sects and the lowest animals, up through the mammals to man himself. Great emphasis is laid on physical exercise, ample sleep and regular hours, on ethical instruction, on very close relationships between parent and child and teacher and child, and upon good literature.

"It is of immense consequence that during the adolescent years the pupils' minds be saturated with the great masterpieces, both in poetry and prose, which deal with romantic love in its purest form. Thought of sex and sex emotion at this time must be spiritualized and placed on the highest plane, and good literature is the most effective means to this end which is available in the public schools."

The committee's report (copies may be obtained from the American Federation of Sex Hygiene, 105 West 40th Street, New York) is by no means a text-book for teachers or parents, but it is a valuable outline of the subject which may be used effectively in measuring the value of such texts and in urging instruction for parents and courses for teachers which will prepare them for their work. The report is strong in its recommendation that parents and the regular teachers give this instruction (in high schools and colleges, the biology and ethics teachers). They are the ones in personal touch with the pupils and, moreover, "specialists in sex" and special courses on sex would partly defeat their own ends by arousing unusual and morbid curiosity and by separating sex instruction from the rest of home life and school life.

The report reaches a high level—but a practical level based on the experience of two teachers and a doctor—in the concluding sentences of the part relating to the highly important early adolescent period, twelve to sixteen years:

"It should be impressed upon every boy that every girl is somebody's daughter and usually somebody's sister, and that it is his sacred duty to afford her the same respect and protection which he would expect from another boy toward his sister."

### PROGRESS IN THE NEW YORK COURT OF APPEALS

EDWARD T. DEVINE

Among the most obnoxious of the common law doctrines in regard to work accidents as interpreted and applied is that of the assumption of risk. So far is this doctrine carried that an injured employe may be refused compensation even when dangerous machinery is left unguarded in direct violation of the labor law. The very fact that an employe has complained of a broken or defective machine may be used as evidence

against him, for it indicates that he knew of the defect.

In the Knisley case the New York Court of Appeals refused relief to a woman employed in a hardware factory in Buffalo whose hand was torn off by a machine, the cog wheels of which were unprotected contrary to the statute. She was held to have assumed the risk of her employment. The present chief justice had previously, while a trial judge, taken the contrary view in a similar case; and two of his associates were on record, either in the Supreme Court or in the Court of Appeals, on the same side. Their position was that public policy precludes an employe from assuming the risk created by a violation of the statute. Subsequently the Federal Circuit Court of Appeals in an elaborate opinion by the present President of the United States held the same doctrine, viz., that risks occasioned by the failure of the employer to supply safeguards positively demanded by statute were not assumed by the employe even though he knew about them. Still later the New York Court of Appeals decided that an agreement between the employe and employer relieving the employer from liability for all personal injuries to the employe that might result from the negligence of the employer was void as against public policy. Finally in a new case decided on October 22 of this year the Court of Appeals, noting that the authority of the Knisley case had been undermined by the more recent federal and state decisions, has flatly reversed its former position and given judgment in favor of a boy of twenty whose foot was crushed while working in the basement of a saw mill, although he is proved to have known of the illegally exposed set screw which did the injury.<sup>1</sup>

We record this decision with great satisfaction. It indicates that on this subject a more humane and enlightened attitude now animates the highest court of this state. Our satisfaction, however, is tempered by certain considerations which it is a plain duty to set forth.

First of all the later decisions which have gradually undermined and now overthrown the authority of the Knisley case are based upon the same common law and the same general legislation which were in existence at the time when the earlier and as it now seems erroneous decisions were made. We do not see how any of those who have defended the earlier decisions, and have hotly resented criticism of them, can now use the present decision as evidence that the critics were wrong. They cannot both eat their cake and have it.

<sup>1</sup>In the case of *Fitzwater vs. Warren, et al.*, reported in the *New York Law Journal* of November 4, the New York Court of Appeals holds that the plaintiff's knowledge of a danger which the employer, in violation of the statute, had permitted to exist does not defeat a recovery for the injury and that, under the circumstances, the assumption of risk is a question for the jury.

If the court has shown evidence of an enlightened spirit now it is clear that something was lacking in its earlier day—and it not so long ago—when their reasoning brought them to an opposite conclusion. The Knisley defendant was refused compensation. Since her day other injured employes and the families of employes who were killed have been denied what the court now says is justice and has been justice for all these years. We are not speaking of social and industrial justice of which we have recently been hearing; but of plain simple legal justice such as the court of appeals aims to mete out to the humblest claimant. How much injustice and hardship in this and other states have resulted from the decision which an enlightened court now declares to be bad law it would not be easy to calculate.

Coming closer to the merits of the present decision, we are compelled to confess some doubts as to whether those who favor a modern system of insurance or workmen's compensation, such as all European nations have and such as other states of the Union are rapidly adopting, will find in it any ground for encouragement. The court thinks that the present effort to secure a constitutional amendment to give the legislature power to enact a compensation law not based on negligence "is in no small measure due to the tendency evinced by the courts to relieve the master, though concededly at fault, from liability to his employe on the theory that the latter assumed the risk of the master's fault." This characteristically mild reflection on the courts is fully warranted. The judge-made doctrine of assumption of risk, as applied in the Knisley case, and as it is still stoutly upheld by Justices Collin and Gray in their dissenting opinion in the Fitzwater case, is certainly one of the glaring iniquities against which the movement for compensation laws is directed. But it is an error to think that the abandonment of that doctrine in those cases in which the employer can be proved to have been culpably negligent will satisfy the public sentiment which has been aroused.

Advocates of compensation laws attack the contributory negligence, assumption of risk, and fellow-servant doctrines not merely because they have been abused, but because they are fundamentally unsound and unjust. The courts tell us that they can be modified or be abolished by statute; but we reply that they were never enacted by statute. The courts should retrace their own steps in contrition and remorse. These doctrines have been bad law from the moment of their inception, and they have worked injury and injustice in every court in which their authority has been recognized. They do not correspond to the facts of industry. They are a continuing cause of poverty, of litigation and industrial

bitterness. To these conclusions we have come, some of us as lawyers and some of us as students of economic and social conditions. It is preposterous to say that these are questions for lawyers alone. No lawyer who does not listen attentively to competent observers of economic facts is fit to pass upon them. We intend to reform these doctrines altogether; to get rid of them. We insist that industry must carry the burden of its deaths and injuries, just as it carries its risk of fires and other accidents, from the undivided profits of the industry itself. We believe that compulsory insurance against industrial injuries, or assured immediate compensation in reasonable amount for all such injuries, will tend to lessen their number and will distribute the burden imposed by the remaining irreducible minimum more equitably than any system of employers' liability enforced by lawsuits. We want to get rid of the ambulance chaser, of the suit for damages, of the law's interminable delays and heart sickening uncertainties, of the corruption incident to this kind of lawsuit, of the unreasonable cost of employers' liability insurance as now administered. We desire to substitute an assured and promptly paid compensation of reasonable amount, for the present illusive right to institute an expensive and tedious lawsuit.

Constructive statesmanship, based on world-wide experience with the problem, rather than a belated and grudging drawing back from the particular consequences of a false system in some one of its applications, is what is needed. The judges do well to cease to countenance such flagrant miscarriage of justice as they have formerly sanctioned; but they should not expect that progress in this negative way, wholesome and praiseworthy as it is, will have any effect in lessening the demand for a modern comprehensive system of insurance or compensation, based not on negligence but on the inherent risks of industry.

These are the ends for which earnest reformers are everywhere working: elsewhere through immediate legislation; in New York, not from choice but because the Court of Appeals has made it necessary, through the process of constitutional amendment. With these purposes the Court of Appeals in its present decision shows no more sympathy than appeared in the Ives decision of last year. The court obviously hopes that by correcting the acknowledged injustice of this particular application of the doctrine, it will successfully check the whole movement for a modern compensation law, at least in this state. While we believe this to be a vain and fantastic hope, we nevertheless, for the sake of those whom it will benefit, rejoice in the fact that hereafter all who are injured because of their employer's criminal neglect are to be allowed to ask for compensation.

"BABY" HEARSEs GOING SIMULTANEOUSLY TO MOUNT ROYAL CEMETERY, MONTREAL.  
LAST JULY

There isn't any compulsory birth registration in Montreal but it is estimated that the city has an infant death rate of 250 per thousand.

## BENEATH THE SURFACE IN MONTREAL

ANNA LOUISE STRONG

Director of the Montreal Child Welfare Exhibition, and

RUFUS D. SMITH

Secretary of the Canadian Conference of Charities and Correction

Two great nations of different language, race and religion, each holding tenaciously to its national customs, divide Montreal into two parts. The French-Canadian Catholics, guaranteed by treaty perpetual preservation of their language and religion, are still in the majority. English citizens, drawing upon the resources of the entire Dominion, of which Montreal is the chief port, possess most of the wealth and the power that goes with it. The conflicts arising from this division have demanded and established two official languages.

Into these distracted and diverse elements the Montreal Child Welfare Exhibition came last month like a cementing force. Difficulties probably not to be found anywhere else in the world, unless in a sister city, Quebec, hedged it about. It was the first attempt Montreal had known to bring into close co-operation, for months together, her full quota of organized bodies, French and English, Catholic and Protestant. Yet the daily attendance in Drill Hall, where the exhibit had been staged, started out with an average clip of from 15,000 to 20,000.

Entertainments and conferences were conducted in both French and English and every inscription in the hall was in two languages. This ran the cost of the exhibition up to \$25,000, of which \$15,000 was given by public grant from the city, the province and the Dominion. But it was money well spent. Many other Canadian cities are planning to follow the lead of the greatest of them all, and in this respect the Montreal exhibit may well do for Canada what the New York Child Welfare Exhibit did for the United States.

Montreal lays claim to being the wealthiest city *per capita* in America. Though relatively small in comparison with the ports of the United States, it has behind it the entire Do-

minion of Canada. Some of its wealth has gone to build up vast private institutions—private schools from McGill College downward, private hospitals and institutions for the care of dependent children. The French, not so wealthy today as they were once, own large tracts of land and many buildings which, steeped in the memories of two centuries ago, stand free from taxation because they are church property. Wherever one goes about the city, these enormous grey-walled structures are seen—some of them, like the Grey Nunnery, housing 1,000 people and caring for foundlings and old men within the same enclosure.

In spite of these evidences of wealth, the social work done by the city government is appallingly small. With tax receipts cut way down by the large amount of exempt property, progress in this direction has been difficult. Thus we find that Montreal has the largest infant mortality rate in North America, and that its density of population per park space is greater than any large city on the continent—greater even than that of crowded New York. We find that Montreal has no free library supported by taxation, and that while there are thirty-five school boards within the city limits, there is no compulsory education and no school census.

To the reader of American newspapers, who learns of fresh methods to combat infant mortality as he learns of new inventions in flying, it is surprising to discover that in a city where summer holds few of the terrors which he knows there is still an infant death rate of 250 per thousand. The statistician of the city hall declared that although his figures are not scientifically accurate, due to the lack of compulsory birth registration, the mortality in Montreal is by far the greatest among the French Canadians. Large families living in overcrowded districts on low salaries contribute greatly to this result.

The health section of the exhibition, occupying two-thirds of the whole floor space, dealt especially with this malady and its causes. Mothers' conferences and baby clinics held every afternoon in French, English, and sometimes Yiddish, Italian, and German, aimed to

present in popular style methods of prevention which can be applied in the home.

With the exception of two screens from the Department of Contagious Diseases and one on medical inspection, visitors from out of town noticed the total absence of exhibits by the Board of Health. This department of Montreal's government has little to do with child welfare. Even medical inspection has been just recently undertaken.

The crux of the housing problem in Montreal is her rear courts. Buildings stand sometimes three deep on a lot and in many cases a narrow covered archway is the only entrance through

of Westmount, which is entirely surrounded by the city of Montreal, and there is a Catholic board of commissioners for most parishes. All of these are supported by taxation, but the text books in one differ from those in another and in many the pupils pay tuition. Since each parish contributes to the support of its own schools, the poorest parish with the largest number of children has the least money for school purposes. The educational system in Montreal is in a condition of chaos.

It would be grossly unfair to say that no one in Montreal knows that such conditions as these exist. Attempts at remedying them are being

ONE OF MONTREAL'S REAR COURTS

which 200 or more people can reach their homes.

The absence of any exhibit from a park department was another lack noticed by the visitor. The only playgrounds in the city are run by private associations, with the exception of three school grounds which were unlocked this last summer by order of the Catholic school board.

Throughout several months an attempt was made to obtain a complete list of schools. No such list could be made up. There is, as far as we know, no complete list of even the public schools in Montreal. There is one Protestant school board for the city, one for the town

made. Yet in these very attempts lurks a familiar danger. Montreal seems not to know that she is threatening to turn herself into that Frankenstein of mismanaged charity, an "institutionalized" city. It is the demand for more institutions which is heard rather than for the thorough-going prevention of child dependence. So it was that in the exhibition sections on philanthropy, law and industry, a strong stand was made for the integrity of the home against the easy and insidious encroachment of the institution. The extension of careful case work in order to stop the breaking up of the family and the building up of a more accurate, substantial body of facts in regard to the actual conditions

surrounding home life were urged. Those in charge of the exhibit experienced the greatest difficulty in getting trustworthy statistics on which to make definite statements.

Now and then, during the last few years, there have been murmurings that child labor exists in Montreal. How much or little no one really knows. An investigation by a French Canadian working girl among several hundred employes brought out, under signed statements, the startling fact that one-third began work before the age of fourteen. Montreal has no compulsory education and no accurate birth registration—two instruments necessary to the enforcement of a child labor law.

The co-operation of the Catholics in this critical stock-taking of their city's social assets stands out as one of the notable achievements among child welfare exhibitions over the continent. Fully one-half of the institutions represented were Catholic and the same percentage was found among the children who took part in the demonstrations. The Catholic section dealing with moral and religious training of the child showed in a comprehensive way the various activities of the church which keep the children bound to its teachings from the cradle to the grave. Perhaps the most comprehensive bit of research done in the entire exhibit was that carried through by three French Catholic associations of young women, representing the employes of department stores, offices and factories. Catholic sisters were everywhere in the hall, guiding the children in drills, gymnastics and singing. What this may mean in co-operation between two peoples and two religions can not easily be measured.

Many needs, the mention of which in the exhibit would have made co-operation on a large scale impossible, were brought out in the Canadian Conference of Charities and Correction. Meeting in Montreal while the exhibit was in progress, this body for the first time in its his-

tory gathered together a national group of social workers.

That Manitoba and Quebec, without compulsory education, have a difficult time in effectively dealing with juvenile delinquency was pointed out by judges from these provinces. The influx of foreign peoples has already made Canada's immigration problem larger in proportion to her population than that of the United States, and there as elsewhere great numbers of the new arrivals, without schooling, are going to work at an early age, later to become a menace to citizenship. Judge Choquet came out strongly for a federal compulsory education act to combat this evil.

It was not until Dr. Henry H. Goddard of Vineland, N. J., pointed out the close connection between poverty and crime, prostitution and feeble-mindedness, that many of those present realized that Montreal was without accommodation for her mental defectives and without means for dealing properly with deficient children in the schools. That crime is to some extent a matter of temperament was one of Dr. Goddard's conclusions. The feeble-minded person who is also phlegmatic, he said, usually becomes a pauper, whereas a nervous and irritable disposition added to weak mentality is quite likely to produce a criminal, and in the case of a woman a prostitute.

To many in the western hemisphere, Canada is a name for thick forests and open wheat-

lands. Yet it was told by those who know her best that today she is in the grip of the same drift from country to city which in our modern day has changed the face of civilization. Dark rooms, unsanitary conditions, slums—all these have found congenial soil. To those who insist that Canada should make her crowded city districts the main point of attack Mr. Armstrong, secretary of the Toronto Housing Association, answered that the Canadian problem was still the problem of safeguarding healthy growth, of

WATCHING OUTDOOR MOVING PICTURES

city planning and of the housing of wage-earners, rather than the rooting up of slums.

As a result of sentiment aroused at the conference a committee is to be appointed for the purpose of getting an amendment to the criminal code making wife desertion an immediately punishable offense. As the code now stands desertion does not amount to a crime until it has resulted in permanent injury to the health of wife or child.

"As a consequence of this," said Howard T. Falk, secretary of the Associated Charities of Winnipeg, "we have frequently been informed by the crown prosecutor that if we want to use the criminal code in a case of wife desertion, we must withhold aid from the family and persuade

all friends to withhold aid also, so that 'actual injury to wife or child will result.'"

Whether Canada with all before her and in the beginning of a rapid growth would realize actual conditions and either eradicate or prevent them was the keynote struck by all who took part in the conference. There were many misgivings, however, as fact after fact was brought out showing that opportunities are fast slipping by and that heroic measures will be needed to develop a strong public opinion along social lines.

## EXPERIMENTS WITH THE EIGHT-HOUR DAY

JOHN A. FITCH

GREY-WALLED AND UNTAXED

Enormous amounts of church property like this are exempt from taxation and so constitute one reason why Montreal has not more money to spend in taking care of its children.

During the last seven years there has occurred a considerable shortening of the working day in the iron and steel industry in Great Britain. During that time all the steel works of any importance in South Wales—in the great tin-producing district—and two of the important steel works in the north of England, in the Middlesbrough district, have changed from the twelve-hour to the eight-hour day in their open-hearth departments. Practically all the blast furnaces in the north of England have adopted the eight-hour schedule in that time, the tin mills are all working on the three-shift system, and the most important association of steel manufacturers in the north of England during the last summer reached such a stage in their negotiation with the Steel Smelters' Union that they requested the union officials to prepare a plan and submit it to the consideration of the association for introducing the eight-hour day in their plants.

There still remain, it is true, blast furnace plants where the long twenty-four-hour shift, recently abandoned by the United States Steel Corporation, still exists, and there are a number of steel plants where the twelve-hour day is in force, especially in the rolling mills. But it is the universal custom in rolling mills in the United Kingdom to stop work at noon on Saturday, and in most of them it is not resumed until Monday morning.

The British Board of Trade report on Earnings and Hours of Labor in the Metal, Engineering and Shipbuilding Trades, shows that as long ago as 1906 the average weekly hours of labor in the blast furnaces was 55.2; in iron and steel mills it was 54.4, and in the tin plate industry it was 47.8. It should be noted that these figures are exclusive of meal-times, for which one-half hour to two hours are allowed. In most cases, this period would be one hour or less, but if the full two hours were granted in every case it would bring up the weekly total of hours spent in the work places to 57.2, 56.4 and 49.8, as against 72 to 84 hours in blast furnaces, 72 hours in rolling mills and 48 in the tin plate industry in the United States.

When in England and Wales a few months ago the writer spent some very interesting hours discussing with union representatives and with employers the effects of the shortening of the working day and learning from them the manner in which it was brought about. In the open-hearth furnaces, so far as the change has been adopted, it has not cost the manufacturers one cent in extra labor cost. In fact, the original proposal made by the Steel Smelters' Union was that they would agree, if the employer would introduce three shifts instead of two, to work for the same rate per ton as that which they had been receiving before. As may readily be imagined, such a reduction in daily earnings was more than the lower paid men could stand. But in order to get the plan into operation, the highly skilled men who were receiving the better wages agreed that a certain percentage of their earnings should be diverted to the men who were not so well paid, in order to make it possible for them all to work eight hours instead of twelve. Since the adoption of the plan, however, the tonnage of the various plants has so increased that the highly skilled men, in spite of their original reduction of 33 1/3 per cent and then their additional voluntary reduction in order to help their fellows, are today earning more money in eight hours than they were getting before when they worked twelve.

Not quite the same arrangement was made in the blast furnaces. There, in most cases, it was felt that a certain increase would have to be made in order to enable the men to have a living wage after having reduced their time one-

third. But there, too, experience has proven that the plan is a success. Output has increased and labor cost has not materially risen. We were told by a representative of the Bolckow Vaughan Company, one of the largest companies in the United Kingdom, that undoubtedly labor cost had increased somewhat, but it is now practically impossible to say how much that increase may be. In spite of that, however, the Bolckow Vaughan Company would not go back to the twelve-hour day and the twenty-four-hour shift in their blast furnaces under any circumstances. They believe, they assured us, that a twelve-hour day in blast furnaces is altogether too long and they would prefer to have a somewhat higher cost and a more satisfactory working day.

It would not be safe to assume that the steel mills and blast furnaces of the United States would have the same experience as England if they were to adopt the eight-hour day. It is apparent even to a layman that the steel mills of Great Britain do not have anything like the automatic machinery that is to be found in all of the important steel mills of the United States. Consequently, they depend much more upon human muscle than do their colleagues in America. It may be readily believed that the output of a mill where the steel is handled to any considerable extent by men with tongs may be considerably increased if those men work an eight-hour day instead of twelve hours. But the same increase is not to be expected in a mill where roll tables and cranes are in more general use. Another feature in connection with the increased output in Great Britain that must be taken into account is the fact that there has been a considerable addition of new machinery during the period since the eight-hour day went into effect. Consequently, the union officials themselves admit that they cannot tell how much of the increased output is attributable to increased efficiency on the part of the men and how much of it is due to improved machinery or different methods.

But it is even more unsafe to assume, in consequence of these facts, that there would not be increased efficiency and increased output in the United States if the steel mills were to adopt an eight-hour day. There is little experience in this country from which to draw conclusions, but it is extremely significant that all of the experience that does exist tends to show that an eight-hour day in steel mills will result in increased efficiency. There are three different places that occur to the writer at present where an eight-hour day has been tested. Eight years ago the men in the finishing mills of the Sharon Steel Hoop Company, located at Sharon, Pa., were given an opportunity to work in three eight-hour shifts instead of in two ten-hour

shifts, as previously. The tonnage of the mills so increased from the very outset that the first pay that the men drew when the eight-hour day had been in operation only two weeks was just as large as their last pay before, drawn when they were working ten hours, and the improvement in the morale of the working force was evident to everyone.<sup>1</sup>

Within six months, the Cambria Steel Company has adopted an eight-hour day in its blast furnaces and while there is no record available that the output of furnaces has increased since this change, there is indisputable evidence that the company believed that there would be an increased efficiency upon the part of the men, for it reduced its working force and increased the task to be assigned to each man to such an extent that each was able to draw the same pay as before, without increasing their labor cost to the company.

But the most complete report that has been made so far of an experiment with the eight-hour day in a steel mill is contained in a paper read by R. A. Bull of the Commonwealth Steel Company, Granite City, Ill., at the convention of the American Foundrymen's Association which met in Buffalo in September of this year.<sup>2</sup> Mr. Bull, after stating that he had been amused by the "misstatement of facts" made by certain "captains of industry" in their testimony concerning the twelve-hour day before congressional investigating committees, went on to state that the steel maker's occupation "is distinctly arduous physically and mentally, carries a responsibility which puts a man's nervous system in frequent high tension and is especially trying on the physical system during the summer months." He describes how the company with which he is associated "some time ago" adopted an eight-hour day for its open hearth furnace and boiler crews. "A careful adjustment of wages was planned which yielded an increase of 28 per cent to the first helpers, 18 per cent to the second helpers and 16 per cent to the third helpers. Even the door boy was included in the plan and was to receive an advance of 19 per cent per hour. The boiler firemen were to be increased 19 per cent per hour and the coal passers 14 per cent."

A careful record was then made of results in the last four weeks prior to the change and the first four weeks following it. A table is presented, too technical for reproduction here, showing in detail the experience under the twelve-hour shift as compared with that under the eight-hour shift. The differences in many cases are not large, but "the pleasing and impor-

tant feature is that the essential ones are in favor of the short shift." The comparisons here include the amount of extra pig iron charged per heat, the average amount of fuel oil consumed per heat and per ton and the average number of cracked castings per heat. In the boiler room, it was found that the number of times in twenty-four hours when steam pressure fell below a certain point was much smaller under the eight-hour shift than it had been under twelve hours and instead of increasing costs, the labor cost per day was actually thirty-eight cents less in twenty-four hours when divided into three shifts than it had been when divided in two. Mr. Bull, commenting upon this comparison, says:

"I do not know if any such comparisons as those which made the basis of this paper have heretofore been made in a similar fashion. It is quite possible that the idea has some degree of novelty in certain of its details, for, notwithstanding the criticisms recently directed against the twelve-hour shift, its prevalence is still almost universal in furnace operation in this country. I feel satisfied that any careful comparison along the lines indicated by the record shown would convince any steel manufacturer of the wisdom of operating on three eight-hour shifts, purely from an economic standpoint. Speaking for the people with whom I am associated, we are greatly pleased over the change and I can speak for the men in the same terms, for our furnace men are enthusiastic in their praise concerning the new plan. And there is no small amount of inward satisfaction in the knowledge that we have done a humane thing. . . . Therefore, viewed from any conceivable angle, I claim the change is justified and you will do well to make it so far as your open-hearth furnaces are concerned. As to your boiler firemen, each operating head must decide for himself. In our particular case, it appeared to be, and finally proved to be, advisable from every standpoint. . . . Reverting finally to consideration of the steelmaker, whose performance under both schedules is made the burden of this argument, the basic principle is absolutely sound, and rests on the incontrovertible fact that you cannot expect any man to give you the best that is in him when you keep him employed without intermission for twelve hours per day seven days per week, at work making a heavy demand upon his mental and physical powers, under conditions of high temperature such as obtain on a furnace floor. To expect the best results under such circumstances is folly."

In the light of experiences like these, there seems ample justification for the statement by Mr. Bull, that "disregarding the ulterior motives of the ever-present demagogue and analyzing this question conservatively, it must be apparent to us that a few more years may see legislation honestly conceived that will put an end to the twelve-hour shift for the steel-maker."

<sup>1</sup>See *The Steel Workers*, Vol. IV, Pittsburgh Survey, pp. 179-180.

## THE TREND OF THINGS

IN a recent issue of the *Independent*, James Oppenheim describes the lynching of Robert Johnson, accused of attempting to assault the sixteen-year-old daughter of a white man, Gordon White, construction boss in the railroad yards. Since Johnson's death, the *Independent* states that his guilt has become a matter of very serious doubt. Mr. Oppenheim shows how thin was the evidence against him and he brings out also with terrible vividness the hysterical spirit of the lyncher. He says:

I saw the effect of the lynching upon old man White; I saw him two weeks after he had sentenced Robert Johnson to death because "he just seed he was guilty." He sat in a low rocker in the sitting room where the attempt at assault had been made; he was in his stocking feet, his great shock of dark hair stood startlingly up from his wrinkled forehead, and his face had the sort of expression I have seen among the insane on Randall's Island. The eyes were burning bright. And he could not be still a moment. Though several of us talked across the room, he did not listen to us, but continually broke in, in a harsh, low voice, repeating monotonously:

"I just know he was guilty. Why did he say, 'I'm ruined,' when they put the overalls on him?"

And again:

"I done the right thing and I know it. All the people here know I done the right thing."

And over and over again:

"I blame them. They shouldn't a taken me over that night."

He gave us an exhibition of how he had

looked at the Negro in the cell at Princeton; the look, certainly, of a maniac. I could imagine a crowd of over a thousand men all with that bestiality in their eyes, all as merciless and maniacal, and I could understand why Robert Johnson screamed to the officers to shoot him down and end his life before he fell into their hands.

\* \* \*

"HOUSEFLY & Co., General Dealers in Typhoid Fever" had a full page advertisement in the first issue of the monthly magazine published by the St. Louis Board of Health. This is a neatly printed eight-page paper, of which 1,500 copies are to be distributed monthly to business houses and public buildings, with the object of disseminating information in regard to sanitation and the prevention of disease.

\* \* \*

BEGINNING with October, *Children's Charities* and the *Juvenile Court Record* of Chicago have been merged under the latter title.

\* \* \*

A GIRL of eighteen and a boy of twenty, found together in a café were brought before a municipal judge on a charge of disorderly conduct. The court imposed a fine and the following bit of advice:

"The best treatment for children like you is a sound spanking."

"The judge was tackling a new problem with old ideas," says

the *Chicago Tribune*. "The best treatment for the young man and young woman in question, and for thousands of young men and young women like them in big cities, is to give them a chance for wholesome companionship.

"When the judge was twenty the American home was a different affair from what it is today. It was pretty generally a story-and-a-half or a two-story house. It had a lawn and a small garden—plenty of room. Most of the amusements of the time were found in the home or near it.

"The young man of that day did his court-

ing in the parlor of the girl's home—a safe retreat giving considerable privacy.

"It is a far cry from that sort of a home to the home of today. In the four or five-room flat space is at a premium and privacy likewise. It is no place to bring a friend to. It is a roost. It affords shelter for the night and a place to eat in, but there it stops. . . .

"The city gives young men and young women plenty of chances to work, but too few chances to play innocently."

\* \* \*

"IT seems as if the workman of the present was thinking more of what he was getting than of what he was giving in return," says *Fibre and Fabric*. "He wants a full envelope, regardless of whether his own efficiency is increasing or not. He accepts a pleasant home as a matter of course, and if he makes any comment at all, remarks that his employer has a better one. His comfortable home is not the result of years of labor, therefore he sets little value on it. He is lagging behind his opportunities. The great fault in our mills today is not in the working conditions, but in the fact that in many cases the operatives do not live up to those conditions. The conditions have got ahead of them and they do not seem able to catch up. Some striking illustrations have been seen of this in the last few weeks. In view of this, would it not be well to call a halt for the present, until there are signs of progress in the ranks? The improvement can hardly be expected to be all on one side. Our enormous foreign population is giving us a huge problem to solve, and we must go slowly in dealing with it. The time seems to have come to stop and look around. We must go forward, indeed, but we must be sure that we are going forward in the right direction. It seems as if respect for the property of others was a lesson that might be learned with profit to all concerned. How to teach it is a question that is worthy of considerable study."

\* \* \*

THE doctrine of workmen's compensation as it is being preached and developed in this country indicates a radical alteration in our social constitution, and has a tendency to bring it into closer resemblance to conditions which exist in older and less admired communities in Europe. Its tendency is to divide—clearly to define classes—to lower the social condition of the workman by posing him as an object of sympathy or a victim of industrial oppression—a policy, which in time may render him, as it has the workmen of Germany and England, obsequious and servile, a malingerer and a pursuer of benefits. These possibilities are mentioned here because, if they develop, they must necessarily find a place in the calculations of underwriters.—*Independent*.

\* \* \*

NO community on this hemisphere devours more literature of the caliber of Tolstoy, Darwin, Turgenieff, Karl Marx, Goethe, or Shakespeare than the East Side [New York] does. Among what other tenement population,

for instance, would a bulky, eight-volume historical work stand a chance of financial success? Yet when the first of the eight-volume history of the United States which Abraham Cahan is writing in Yiddish came out, the East Side gobbled it up, to the tune of twenty thousand copies at a dollar a copy. And now the second volume is going at the same rate.—JOSEPH GOLLOMB in the *American Magazine*.

\* \* \*

PUSHKIN PARK, says a dispatch, was the only children's playground at Sevastopol, Russia. It was opened by public subscription and has been closed by administrative order, because the children's laughter and shouting interfered with the work of the police officials in their near-by offices. "Seldom," comments the *New York Evening Post*, "does a news item carry so double-edged a statement. What does more interfere with the work for which, unhappily, police officials must be employed, than the health and happiness that are expressed in the riotous noise of boys and girls at play?"

\* \* \*

## THE GUIDES

MARGARET WIDDEMER in the *Craftsman*

Where have you been the long day through,  
Little brothers of mine?  
Soon the world shall belong to you,  
Yours to mar and to build anew:  
Have you been to learn what the world shall do,  
Little brothers going home?

We have been to learn through the livelong day  
Where the great looms echo and crash and sway,  
The world has willed it, and we obey,  
Elder brother.

What did you learn till set of sun,  
Little brothers of mine?  
Down where the great looms wove and spun,  
You who are many where we are one  
(We whose day is so nearly done),  
Little brothers pacing home?

We have learned the things that the milk-folk said,  
That Man is cruel and God is dead . . .  
And how to weave with an even thread,  
Elder brother.

What did you win with the thing they taught,  
Little brothers of mine,  
You whose sons shall have strength you brought,  
Fashion their lives of the faith you bought,  
Follow afar the ways you sought,  
Little brothers tolling home?

Shattered body and stunted brain,  
Hearts made hard with need of gain,  
These we won and must give again,  
Elder brother.

How shall the world fare in your hand,  
Little brothers of mine?  
When you shall stand where now we stand—  
Shall you lift a light in the darkened land,  
Or fire its way with a burning brand;  
Little brothers stealing home?

What of the way the world shall fare?  
What the world has given the world must bear . . .  
We are tired—oh, tired—and we cannot care,  
Elder brother!

## BOOKS

### FRESH AIR AND HOW TO USE IT

By THOMAS SPEES CARRINGTON, M.D. National Association for the Study and Prevention of Tuberculosis. 250 pp. By mail of THE SURVEY \$1 postpaid.

It should no more be necessary to review, or to write, a book on Fresh Air and How To Use It than on Pure Food and How To Eat It or on Cold Water and How To Drink It. But thanks to ourselves and to our ancestors all three are needed, and the first of the three is here met in a way to serve as model for the dietitians and the white ribboners.

First, man, an outdoor creature, of necessity built himself a house strong enough and tight enough to keep out his enemies while he slept. Then, increasingly an indoor worker, he fell a soft victim to the heat he had generated, and worked and slept and lived behind closed doors and windows. The higher our civilization, the more are we housebound and the greater is our death rate from tuberculosis.

The indoor sleepers did not awake until the twentieth century and the reveille was sounded by the National Association for the Study and Prevention of Tuberculosis. Fresh air cures tuberculosis and pneumonia. It prevents half—or is it all?—the diseases in that grewsome periodical of the Health Department published regularly under the title Causes of Death the Past Month.

No country house is built nowadays without an open-air room. It has become a truism of suburban architecture. But to most of us—dwellers in the homes of our fathers who feared the night air, or in the apartments of thrifty landlords who meet only the requirements of a tenement house law—Dr. Carrington's book is a practical guide to health and zest and vigorous days following nights of real refreshment. For he shows us in clear text and photographs, in plans and tables of cost, how to tack an inexpensive sleeping porch on the old house without making it look like a wart, how to use the roof or even just a window in the flat building for sleeping out in effect if not in fact, what sort of bedding we must have, and how to buy, or to contrive at a quarter the expense, the outdoor winter "nighty."

It is one of the simplest, most practical and best illustrated of handbooks. A. P. K.

### SOCIALISM AND CHARACTER

By VIDA D. SCUDDER. Houghton Mifflin Company. 431 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

In a volume of over four hundred pages, Miss Scudder attempts the double task of analyzing the moral ideal of the religious-minded conservative and of the Socialist, and of showing that in the main the two are not antagonistic, but one. She goes further; she, as a convinced Socialist, believes that the Socialist reconstruction of society alone would provide an environment in which it would be possible to live up to the precepts of the Sermon on the Mount. She shows

that out of the practical fact of the competitive struggle in society has come the anomalous situation of two conflicting moral codes, both equally necessary. One aims at self-preservation and inculcates aggressive, self-interested qualities; the other is other-worldly and altruistic, inculcating the ethics of the New Testament. In the Socialist commonwealth she maintains that these two would be reconciled. The class war she regards as the struggle of a brotherhood whose aim is to bring all society into that brotherhood in which the individual good would be synonymous with the common good, and self-preservation would be attained by loyalty to the race.

"The working class movement," she says, "is the only form of group consciousness yet evolved in history to look beyond its own corporate aim. It is inspired by a passion of good-will for all men, and never loses sight of a universal goal."

While recognizing that materialism is the rock on which Socialism may founder, Miss Scudder points out that it is from the materially comfortable classes that this criticism of Socialism emanates. She believes that with the mass, as with the few, given proper moral preparation, material well-being need bring with it no moral degradation. This moral preparation is, however, she believes, the greatest need in the teaching of Socialism today, for, "should Socialism arrive otherwise than as the result of an inward transformation affecting the deep springs of will and love, it would prove the worst disaster of any experiment in collective living that the world has seen."

Miss Scudder's book is thus unique among recent publications on Socialism.

M. B. S.

### ENGLISH APPRENTICESHIP AND CHILD LABOUR

By JOCELYN DUNLOP and RICHARD D. DENMAN, M.P. The Macmillan Company. 390 pp. Price \$5.00; by mail of THE SURVEY \$5.15.

A careful search through century-old records of English cities, guilds, companies and courts of law has resulted in the discovery of a wealth of material which throws bright light on present-day problems of child labor. That neither the work of children nor "the arduous and constant labor of women" are modern phenomena is a fact to be emphasized, if we would deal soberly with conditions to be met today. The records show that both date back several centuries, antedating indeed the industrial revolution which is commonly held responsible for them. "Machine work and factories did not create the evil," say these authors (pp. 303-4). "All they did was to throw it into publicity." The fundamental remedy advocated is not a new social conscience, but "the old sense of responsibility of the public and the employe toward the juvenile workman."

It was of course the organization of guilds which made possible the system of apprenticeship to which later a national stamp was given

by Elizabeth's statute. The system was prompted largely by the self-interest of the gilds and the commercial ambition of the nation, yet the evidence seems to indicate that before the days of tender conscience toward children, careful regulation of industrial conditions mitigated many of the ill effects of children's work. Indeed these authors declare, as a result of their careful researches, that "at the beginning of the eighteenth century the country stood possessed of a great system of general training and technical instruction; great because whatever were its shortcomings, apprenticeship contributed annually to the wealth of the nation a large number of skilled workmen, and moulded the character of a vast number of English boys, whom it then sent out into the world with the ability to keep themselves from want and unemployment" (p. 223).

Then came the breakdown of the system, first, as capitalism grew and independent workmen gave place to dependent wage-earners, and second, as the introduction of machinery further complicated industrial problems. And just at that moment, when enlightened action was most needed, before the new order of industry fastened a new set of evils upon society, public opinion became possessed of the notion that prosperity depended upon the doctrine of *laissez faire*. England and America have not yet recovered from the loss of that opportunity more than a century ago.

This history of child labor with its record of blindness on the part of the public and its positive data showing how much is involved in the present problems of juvenile labor and of children's education, should help to open the eyes of twentieth century citizens both in England and America.

M. V. K.

#### THE CHILD'S DAY. BOOK ONE, WOODS HUTCHINSON HEALTH SERIES

By WOODS HUTCHINSON. Houghton Mifflin Company. 184 pp. Price \$1.40; by mail of THE SURVEY \$1.46.

#### THE BOY AND HIS CLUBS

By WILLIAM MCCORMICK. Fleming H. Revell Company. 96 pp. Price \$.50; by mail of THE SURVEY \$.58.

#### THE CONSERVATION OF THE CHILD

A manual of clinical psychology presenting the examination and treatment of backward children. By ARTHUR HOLMES. J. B. Lippincott Company. 345 pp. Price \$1.25; by mail of THE SURVEY \$1.35.

#### PROGRESS AND UNIFORMITY IN CHILD LABOR LEGISLATION

A study in statistical measurement. By WILLIAM F. OGBURN. Columbia University. Longmans, Green & Company, agents. 219 pp. Price \$1.75; by mail of THE SURVEY \$1.83.

#### CITIZENS MADE AND REMADE

By WILLIAM R. GEORGE and LYMAN BEECHER STOWE. Houghton Mifflin Company. 264 pp. Price \$1.25; by mail of THE SURVEY \$1.35.

In THE SURVEY for October, it was pointed out that the six books relating to children then reviewed were severally of special value to different groups of readers. The same is true of the five additional books above listed.

Dr. Woods Hutchinson, aided by his sister, Mabel Hutchinson Douglass, who is a professor in Whittier College, Cal., has written sane, alluring and simple suggestions for the care of the child's body for a long, active and happy

child's day. It follows the sound, but all too rarely applied, pedagogical principle of teaching a child what to do instead of telling him what not to do. The children who read the book will enjoy it and it will do them good. If you know school children from the second or third grade to the fifth or sixth you know the readers for whom this book was intended.

\* \* \*

Mr. McCormick has in mind men and women, especially men, and of men especially young men, who are in churches and who are asking what they can do for the boys of their church and community. The writer is in sympathy with the Y. M. C. A., playgrounds, Boy Scouts, out-door gymnasia, Big Brothers, etc., but he believes all these are inadequate and need supplementing in most communities by a boys' club of the mass variety, which the author himself describes as follows:

"And here steps in the boys' club of the mass variety, which catches boys by the wholesale, fascinates them by its fun, entertains them for a penny or two a week, and if properly managed holds them for years, rearing them from their twelve-year-old boyhood into their twenty-one-year-old manhood, and befriending in time their wives, and coddling their babies, and giving to their varied households a friendship and an uplift which they could not anywhere else have found."

There is a seven-nights-a-week, three-hundred-and-sixty-five-days-a-year appeal to boys in the author's plan that compares favorably with the always-open-for-business method of the saloon.

The young men of the churches who want to do something for the boys should read Mr. McCormick's little book.

\* \* \*

Professor Holmes has a message for teachers, superintendents of institutions for defective, dependent and delinquent children, secretaries of placing-out agencies and intelligent parents. Many among the above classes of persons are becoming daily more keenly conscious of the problem of the unusual child as one who so deviates in conduct from the majority of children that he does not respond to the ordinary methods of care, education and discipline. It is more and more evident that such children need special consideration to enable them to make the most of themselves and also to protect other children from the doubtful results of intimacy with them. We are also learning rapidly that the parents, teachers, doctors, and social workers too often in the stress of the day's work have neither the time nor the ability for such special study of these atypical children as will reveal the essential nature of their peculiarities and will suggest the best plans for future care and training. During the last few years, therefore, there have been started in several cities clinics specially equipped with the necessary apparatus and directed by specially trained men and women to give such an examination supplemented by prolonged study and observation, if necessary,

as will lead to the best possible diagnosis and prognosis of the physical, mental and moral deviations of the children studied. Dr. Holmes's book is based upon the work of the Psychological Clinic founded by Dr. Lightner Witmer of the University of Pennsylvania. It is a clear, interesting and simple statement of the methods used in the examination and classification of all atypical children. There is a brief story of the evolution of method in dealing with defective children and the reader is repeatedly informed that the methods of the clinic will give results of value to the child and to society only when used by specially trained and experienced men and women.

Cock-sure and off-hand decisions that a child is or is not incurably feeble-minded must not be made by inexperienced persons who have become enamored by the fascinating classifications of the Binet and other tests.

In short, the author makes it clear how necessary it is that all persons who care for children should know how to aid in securing the best possible psychological examination of atypical children, but also makes it equally clear that it is the duty of all such persons not to become psychological quacks or to trust in them.

It is exasperating to the earnest worker who ought frequently to refer to the valuable discussion of this book, to find that it has no index.

\* \* \*

A fourth audience of students and legislators is addressed by Dr. Ogburn. While his book is a statistical study of complex details and is crammed with tables and curves of statistics, a layman, even though he be a legislator, should be able to get help from this study in getting a clear view of the status of labor legislation in his own state compared with that in all the other states in the country.

The study covers all the laws relating to the labor of children, some five hundred in all, enacted by all the states and territories from 1879 to 1909. These laws are compared in respect to six essential provisions:—age limit, hours of labor, educational qualifications, working papers, enforcement by inspectors and enforcement by penalty. As a striking example of progress in legislation, Table LXXXVI shows the number of different states that had two or more of the above six provisions at the end of each five year period. For example, in 1879 seven states had laws with provisions relating only to hours of labor and penalty and none had provisions relating to all six of the essential provisions. In 1909 there were still seven states that had only the two provisions relating to hours of labor and penalty, but twenty-two states had laws with all six of the essential provisions. The statistical niceties of the study may perplex the uninitiated, but any intelligent reader can readily compare the situation of child labor legislation in any state with the situation in all the other states during the thirty-year period studied.

The study is unique in attempting to show quantitative differences as well as qualitative differences in child labor laws.

\* \* \*

And, finally, Mr. George and Mr. Stowe speak to all who are interested in the training of citizens for a democracy. Mr. George has himself told the detailed story of the George Junior Republic of Freeville, N. Y., in a former book—*The Junior Republic*.

His remarkable personality and his experiment at Freeville furnish the primary inspiration for this book also, but Mr. Stowe who actually writes the book has gleaned further data from experiments in democracy in public schools, orphan asylums, the public streets and self-governing communities composed largely of adventurers and criminals. Mr. George has until recently felt that there must be an economic basis for effective self-government. Since the winter of 1911, however, he has changed his mind.

"As a result of personal investigation of certain schools having methods of pupil self-government, Mr. George came to the conclusion that organized public opinion, even without an economic basis, was in itself a powerful enough force to make self-government effective. Since then he has been as keen an advocate of self-government in general as of the type of self-government exemplified in junior republics."

Not only do the authors believe that self-government is a necessary means of educating young people to citizenship in a democracy, but that it is equally necessary to the re-education of so-called criminals. A unique series of self-governing communities into which and out of which the criminal can go only as a result of the judgment of his fellow citizens in each community is proposed by Mr. George, and he is ready to stake his reputation on the successful working of his plan.

In the kindergarten, children help to decide how to work and play together. Can anyone doubt the power of persons from the kindergarten to old age to do the same thing if they get the proper incentives and opportunity? If we really believe in democracy—in the self-government of a people—we cannot lightly dismiss the problem of educating our people for their job. We have differed widely over the forms which different self-government plans for young people should take, but this is beside the main question—can young people and older people really learn to play a team game in any other way than by having a chance to practice playing a team game? Mr. George and Mr. Stowe say "no" and what is more to the point they make out a pretty strong case that in small groups at least we can and do learn to play a team game when we get a real chance to practice. As for the rules of the game the reviewer believes there is only one safe plan to follow: there must be only such rules as grow out of the needs of the game itself and not any lugged in from some other game.

HENRY W. THURSTON.

#### THE NEW CITY GOVERNMENT

By HENRY BRUERE, Director of the New York Bureau of Municipal Research. D. Appleton & Co. 438 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

Summarizing in this volume his conclusions from a field study of ten commission governed

cities, Mr. Bruere declares that the most conspicuous effect of this much lauded new plan of municipal administration seems to have been upon public improvements. While characterizing commission government as "an inspiring manifestation of democratic self-reliance," he feels that we need, in commission cities as well as in our larger and older municipalities, a broader social sense and better technique in administrative methods.

Commission government, he declares, "has no marked social welfare impetus. As an illustration of this may be pointed out the conspicuous neglect of health activities in many of the cities studied. The city prison in Des Moines for which the city is responsible is a national disgrace. Like prison conditions exist in other commission governed cities. The jails in Topeka, Kan., and in Dallas would be a blot upon any city government. . . . No commission in any city visited has adequate facts upon which it can base a program for city service. Des Moines does not even report its vital statistics nor register tuberculosis." Chicago, New York, Boston, and other cities, in his opinion, have proceeded farther toward placing the selection and retention of civil employes on the basis of fitness than have the commission cities. Another criticism he advances is that commission government has failed in most instances to utilize the splendid equipment of the school for recreational and educational work among the people.

The results of carefully planned tests designed to show how commission government differs from ordinary government as to program, method and accomplishments, are presented in chapters on Accounting and Reporting Methods, Budget Making, Purchasing and Store Keeping, Public Works Administration, Protection of Persons and Property, Protection of Life and Health, Selection and Training of Personnel, and Citizen Control and Co-operation. These tests lead the author to conclude that commission government's centralization of power and elimination of useless formalities are assets of great value in planning efficiency effort rather than a solution of what Ambassador Bryce has termed "our most conspicuous failure." The book constitutes a valuable addition to the literature on improved city administration and is distinctive in method and in treatment from previous volumes published upon the merits of commission government in operation.

J. P. H.

#### THE TASK OF SOCIAL HYGIENE

By HAYLOCK ELLIS. Houghton Mifflin Company. 414 pp. Price \$2.50; by mail of THE SURVEY \$2.63.

In this interpretation of his vast store of knowledge of the psychological and social aspects of sex, one of the greatest English eugenicists gives in popular and exceedingly readable form the elements that go to make up the social hygiene movement, a movement which he believes to be the most important development in reform in the last hundred years. Older forms of nineteenth century reform—sanitation, factory legislation, public education and the care of the infant before and after birth—are,

in his phrase, the "strengthening of the banks of the stream of life." Social hygiene or eugenics is the purifying of the stream itself.

While like many eugenicists Mr. Ellis fails, explicitly at any rate, to recognize the direct and important effect on the purity of the stream of the careful guarding of its banks, he does not fail to recognize the direct connection between the stream of life and its sources, the "breeders of men." To the woman movement, especially in its modern form as a movement for the freedom of the mother, he looks as one of the great sources of social hygiene. Closely connected with this, he recognizes two other movements, or rather tendencies, looking toward the improvement of the race. These are the loosening up of divorce laws and the steady fall of the birth rate in all countries of the civilized world during the last generation. To the latter subject he devotes a chapter, rich in facts and figures, analyzing the forces, many of them unconscious, which under a high civilization tend to prevent a "waste in births" but keep population steady by "economy in deaths."

These are existing eugenic tendencies. Equally important with them, is the tendency just in its beginnings to replace blind instinct in love by the purposeful selection of a mate fitted physically and morally to continue the race. Mr. Ellis's treatment of this subject is on a particularly high plane. He repudiates legislation or any other method of compulsory "stock breeding" as both impracticable and beneath the spiritual dignity of the race. He believes that "man can only be bred upward through the medium of wisdom and will, working together under the control of a social responsibility that has become a religion." The task of social hygiene is therefore, in the opinion of this co-worker with Francis Galton, no less than that of moral education, which aims gradually to "modify social conventions, enter family life, transform the moral outlook and inspire our religion and philosophy."

Some of the moral and intellectual possibilities of the race of the future, governed by these new social sanctions, are hinted at in the chapters on the war against war, an international language, and the struggle between individualism and Socialism. The latter struggle promises, in Mr. Ellis's prophetic view, to be settled in the new society by the recognition that the interests of the whole and of the individual are one, and that in the last analysis, social hygiene is the hygiene of each individual soul.

M. B. S.

#### THE NEW IMMIGRATION

By PETER ROBERTS. PH. D. The Macmillan Company, 386 pp. Price \$1.60; by mail of THE SURVEY \$1.74.

Like a rapidly running picture film accompanied by a lecture, this very human document on immigrant life in America flashes out hundreds of quick, picturesque anecdotes concerning our newcomers of the last thirty years, and weaves them all into a convincing discussion of the immigration problem.

The quality of sympathetic narration that

marks Professor Steiner's work is felt here also, although there has been an effort in this case to make a fairly comprehensive survey of the entire field rather than to throw a shaft of light on a few singled out aspects of it. The book is possibly the least academic and most intimate and graphic view of the actual living and working conditions of our immigrants that has yet appeared. To give his conclusions general backing, the author draws freely upon the findings of the Federal Immigration Commission and previous investigations. The volume is well captioned and indexed for class use and admirably suited to the purpose of study groups in immigration.

Beginning with the immigrant's passage to America and his trials at the Babelmandeb or "Gate of Tears" at Ellis Island, the author follows the farmer from southeastern Europe into his city tenement home and into the industrial moil of a lusty, growing nation; studies the natural maladjustments and the struggle toward adaptation; strikes in rapid succession to the heart of the various problems of the immigrant and the community in their relation to each other; and concludes with the thesis that complete assimilation can come only through a radical change of attitude on the part of native-born Americans.

"The greatest obstacle today in the United States to the assimilation of the immigrants, is the prejudice and antipathy of the native born." Declaring that isolation is stagnation, he says: "Legislative action and private organization can do much for immigrants, but most effective of all remedies is personal contact. If this personal touch is secured, the immigration problem will be solved in the light of the brotherhood of man and the spirit of our democracy."

The author argues that immigration to the United States is not merely a national problem, but international. Instead of considering only America's interests in enacting laws regulating immigration and emigration, the interests of all nations concerned should be given an opportunity for expression, possibly at an international conference.

- THROUGH THE SCHOOL. By Al Priddy. The Pilgrim Press. 404 pp. Price \$1.50; by mail of THE SURVEY \$1.65.

## JOTTINGS

#### PROBATION CONFERENCE

The Fifth New York State Conference of Probation Officers will convene at Syracuse November 19. The subjects on the program refer about equally to juvenile and adult probation, and include the following: feeble-minded delinquents; annual reports and helpful newspaper publicity; probation associations; probation in cases of men guilty of crime against property; special problems of women probation officers; probation in rural communities; lessons from the recent inquiries in the Chicago Juvenile Court; important phases of juvenile probation; cases of adult contributory delinquency. The conference is intended not only for probation officers, but others interested in the subject.

#### THE ILLINOIS CONFERENCE

The sessions of the seventeenth Illinois State Conference of Charities and Correction, October 19-22, were reinforced by an exhibit which was visited by hundreds of the residents of Springfield, the conference city. The address of Alexander Johnson on the opening day on Social Causes of Distress sounded the keynote of the entire week. Right through the program of the general meetings ran the idea that the problems being dealt with were community rather than individual problems, and that as such they demanded the intelligent co-operation of all the men and women of the state.

Perhaps a natural result of this trend of discussion was a luncheon at which a number of Springfield people expressed themselves as favoring a complete social survey of the capital city. The sanitary survey, carried out last year by Dr. George T. Palmer, health commissioner, gives Springfield an important lead in this field and it is felt that by rounding it out, a demon-

stration can be made which will be of value to the whole state.

Officers for the 1913 conference to be held at Rockford are: president, Dr. F. Emory Lyon, Chicago; first vice-president, Mrs. W. E. Simonds, Galesburg; second vice-president, Col. Henry Davis, Springfield; secretary, A. E. Bowen, Springfield.

#### PLAGUE AND FEDERAL QUARANTINE

More than once THE SURVEY has presented reasons for placing the whole of the quarantine service under federal control. Dr. W. F. Brunner, who was in charge of the United States Marine Hospital Station at Havana from April, 1897, until the flag was taken down from the American consulate, and who later, inspected returning troops, has seized upon the present fear that bubonic plague may enter this country to renew this demand. Dr. Brunner believes the plague is coming—some time. The New York *Times* recently quoted him as follows: "In a case of plague you could not quarantine one state against another. The plague would be apt to last two or three years, and this would kill commerce. Then, too, a transmissible disease doesn't respect a state boundary line. A national quarantine in every port would be our greatest safeguard. What wiped out the San Francisco plague? Only the earthquake and the fire that wiped out Chinatown. We cannot afford to burn up a city, and we had better get to work on a uniform national quarantine service. It is easier to prevent than to cure."

#### NEW SLOGAN: "BAT THE RAT"

Campaigns of individual aggressiveness against animals that are spreaders of disease are likely to multiply, especially since the "swat the fly" program has been so effective. "Bat the rat" is the latest slogan of the sanitarians. The Chicago Department of Health urges the pursuance of such a campaign because rats and their fleas are spreaders of bubonic plague. Unlike flies, they are with us the year round. The timeliness of the suggestion lies in the fact that bubonic plague has been more or less prevalent during the past summer at Porto Rico, Havana and other points near the American seaboard.

#### A NEW WEAPON AGAINST TUBERCULOSIS

At a meeting of the State Board of Health, held in Columbus recently, steps were taken to co-operate with the Ohio Society for the Prevention of Tuberculosis in a campaign to secure an appropriation of \$25,000 per year for two years by the approaching general assembly. This appropriation will be asked to enable the State Board of Health to create a division of tuberculosis under its jurisdiction. The division, it is planned, will be in hands of experts and will carry on an aggressive campaign of education, aimed at tuberculosis prevention. The Committee on Public Policy and Legislation of the Ohio State Medical Association will join in asking the next legislature to grant the appropriation.

#### SALE OF MILK IN NEW YORK

The New York City Board of Health has adopted a resolution aimed to strengthen the safeguards surrounding the sale of so-called "dipped" or "loose" milk. Under its terms it will be illegal after June 1, 1913, to sell milk dipped from cans except in approved milk stores under permits from the Board of Health or in stores in which food-stuffs other than milk products are sold in original packages only. It is pointed out that many of the 14,000 places where "dipped" milk is sold in New York are grocery stores where many other commodities are handled in a manner which must necessarily cause much dust. Moreover, the facilities for proper cleansing of utensils, for the protection of the milk from flies and for proper icing are often very inadequate. In too many cases, it is declared, the room where the milk is sold communicates directly with living apartments.

#### CATHOLICS ON SOCIAL NEEDS

Some seventy men followed the course on social questions given at Fordham University last summer. Most of those in attendance lived in Greater New York but a few came from points as far distant as Buffalo and Pittsburgh. The lecturers were Rev. H. J. Maeckel, Rev. J. A. Ryan and David Goldstein, the whole field of social problems, including the labor problem, being covered briefly.

This is the third year in which such lecture courses have been held under the auspices of the German Catholic Central Verein, one being given annually in the East and one in the West. During the three years the course has been given the number of those in attendance has steadily increased from year to year and the German-American Catholics have given their co-religionists of other nationalities an example of constructive work along the line of social study. At the close of the Fordham conference there was formed an organization for continuous study under the name of the Eastern Study Circle.

#### TRAINING SOCIAL WORKERS IN GEORGIA

A training school for social workers proved to be as much needed in the mill towns of Georgia as in the crowded industrial cities of the North. In a recent issue of the *Churchman* Henry Disbrow Phillips, director of the settlement at La Grange, Ga., which has recently opened such a school, tells of conditions among native American textile workers and of the work and influence of his settlement among them.

#### NEW DISTRICT OPENED

Last month, the Charity Organization Society of New York opened a new district, known as the "Jefferson District." It covers the territory between 90th Street and 116th Street east of Central Park and Seventh Avenue. Ruth F. Waldo, formerly assistant district secretary in the Harlem District, has been appointed secretary in charge.

# THE SURVEY

Volume XXIX, No. 8

November 23, 1912

n.p.

ANNOUNCING  
THE  
SURVEY ASSOCIATES  
INC.

*An adventure in co-operative journalism*

Founded in the '90's by the Charity Organization Society of the City of New York,—entrusted in 1905 to a National Publication Committee,—THE SURVEY has now been turned over by the parent society to an independent organization, open to its readers.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts. Over 700 readers contributed \$10 or more towards its budget the past year—twice the number of the year preceding.

With this democratic, convinced backing as a natural membership base, the Survey Associates becomes in fact—what THE SURVEY has long been in spirit—a mutual enterprise.

*Will you join its fellowship?*

This Issue Includes Annual Report Section

A JOURNAL OF CONSTRUCTIVE PHILANTHROPY

## INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

### Child Labor

National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y.  
25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

### Recreation Bibliography

Division of Recreation of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. Pamphlet containing a list of the more formal publications, with annotations, and an extensive list of magazine articles dealing with the subject of recreation. Price 10 cents per copy.

### Tuberculosis

National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M. D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual Transactions and other publications free to members.

### Working Women

National Women's Trade Union League, to better industrial conditions through organization and legislation. Information given. "Life and Labor," events in industrial world. Three months for 25c. Mrs. Raymond Robins, Pres., 127 N. Dearborn St., Chicago.

### Prison Labor

National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph.D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

### Child Helping

Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York.  
Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

### Conservation of Infant Life.

American Association for Study and Prevention of Infant Mortality. 1211 Cathedral Street, Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request.  
Studies preventable causes of death and illness; urges birth registration, maternal nursing, parental instruction.

### Sex Hygiene

Society of Sanitary and Moral Prophylaxis. Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y 22 affiliated societies.  
Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

### Mental Hygiene

National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene. State Societies for Mental Hygiene.

### Women in Industry

National Consumers' League, 106 East 19th St., New York. Mrs. Florence Kelley, Gen'l Sec'y. 87 branch leagues. Reports, pamphlets sent on request. Minimum membership fee \$1.00 includes current pamphlets. Minimum wages boards, protection of women workers, pure food, sweatshops, etc.

### Young Women

National Board, Y. W. C. A., 600 Lexington Ave., N. Y. C. Official magazine: *The Association Monthly*. Pres., Miss Grace H. Dodge, Gen. Sec'y., Miss Mabel Cratty. The advancement of Christian Social Service. Free literature (all departments).

### The American Seamen's Friend Society

Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y.  
The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

### Recreation

Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y.  
Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

### Mental Deficiency

The American Association for the study of the feeble-minded, publishes the proceedings and papers of its annual meetings in the *Journal of Psycho Asthenics*. Address Dr. A. C. Rogers, secretary, at Faribault, Minnesota.

### School Hygiene

American School Hygiene Association. Pres., David L. Edsall, M. D., Harvard University Medical School; Sec'y., Thomas A. Storey, M. D., College of the City of New York, New York.  
Yearly congresses and proceedings.

### National Health

Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York.  
To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

### Evening Clubs for Girls

National League of Women Workers  
Hotel Savoy, New York.  
Organizing Sec'y., Jean Hamilton.  
Recreation and instruction in self-governing and self-supporting groups for girls over working age. Monthly magazine—"The Club Worker" Twenty-five cents 1 year.

### Labor Legislation

Workmen's Compensation; Industrial Hygiene; Labor Laws.  
Official publication: *American Labor Legislation Review*, sent free to members.  
American Association for Labor Legislation, Metropolitan Tower, New York City. John B. Andrews, Secretary.

### Short Ballot and Commission Government

The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

### Municipal Problems

National Municipal League, 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

### Charities and Correction

THE PROCEEDINGS of the National Conference of Charities and Correction sent free to each member. BUREAU OF INFORMATION on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 2, 1913.

# INFORMATION DESK

Continued from preceding page

## Charity Organization

Charity Organization Department of the Russell Sage Foundation, 105 E. 22d St., New York City.

To study, teach and publish in the charity organization field. Pamphlets on family treatment, community study, relief, transportation, etc., sent free.

## The Church and Social Service

The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service.

For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Ave. (at 18th St.), New York.

## Unitarian Social Advance

The American Unitarian Association through its Department of Social and Public Service.

Reports and Bulletins free. Lecture Bureau. Social Service Committees. Rev. Elmer S. Forbes, Secretary of the Department, 25 Beacon St., Boston.

## Social Betterment for Negroes

National League on Urban Conditions Among Negroes, 281 Fourth Avenue, E. R. A. Seligman, Chairman; G. E. Haynes, Director. Develops welfare agencies. Trains social workers. Aids travelers. Supports probation officers. Seeks industrial opportunities. Correspondence invited.

## Home and Institutional Economics

American Home Economics Association, for Home, Institution, and School. Publishes Journal of Home Economics, 600 pp. per vol. \$2.00 per year. Conducts Graduate School of Home Economics. Meeting: Boston, December 31, 1912—Address, Roland Park, Baltimore, Md.

## Aid for Travelers

The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex.

For literature address Orin C. Baker, Gen. Secy., 238 East 48th Street, New York City.

## Eugenics

EUGENICS RECORD OFFICE, COLD SPRING HARBOR, L. I., N. Y. (American Breeders Assoc., Eugenics Sect., Charles B. Davenport, Sec.). Membership \$2. a year. National repository of data on hereditary family traits. Schedules for family records furnished free. Advice as to suitable matings. Publications at cost. H. H. LAUGHLIN, Supt.

## The Smoke Nuisance

Send 25 cents, stamps or coin, for American Civic Association Bulletin on "Smoke Abatement; How to Organize for Pure Air; Model Ordinances, etc." Address American Civic Association, 914 Union Trust Bldg., Washington, D. C.

## Presbyterian Social Service

Bureau of Social Service, The Presbyterian Board of Home Missions; Rev. Charles Stelzle, Supt., 156 Fifth Avenue, New York.

Sociological surveys made. Clearing house for city problems of the Church. "Downtown Church" Labor Temple, New York. Literature free.

## Studies in Social Christianity

Oct.: Growth and Causes of Crime. Nov.: Treatment of the Criminal. Dec.: Prevention of Crime.

See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York City. Price 50c. per year.

## Methodist Social Service

Methodist Federation for Social Service; Literature; Bureau of Information, Speakers' Bureau; Reading and study courses; Invites all Methodists to extend its usefulness and use its facilities.

Rev. Harry F. Ward, Secy., 343 S. Oak Park Ave., Oak Park, Ill.

## Negro and Race Problems

National Association for the Advancement of Colored People, 26 Vesey Street, New York. O. G. Villard, Chairman, Board of Directors; M. C. Nerney, Secretary; W. E. B. Du Bois, Director Publicity. Publishes Crisis Magazine. Investigation, Legal Redress, Literature, Lectures, Lantern Slides.

## Probation

National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y.

Advice and information; literature; directory of probation officers; annual conference. Membership, One Dollar a year.

## Boy Scouts

National Headquarters of the Boy Scouts of America, 200 Fifth Ave., New York City. James E. West, Chief Scout Executive. Local Councils organized in principal cities, towns and counties. Literature on request. Monthly magazine, "Boys' Life" \$1 a year. Memberships: Associate \$3, Sustaining \$10.

## Surveys and Exhibits

Department of Surveys and Exhibits, Russell Sage Foundation, 31 Union Square, New York City. A national clearing house for advice and information on social surveys and exhibits and for field assistance in organizing surveys and exhibits.

## City Planning

National City Planning Conference 19 Congress St., Boston, Mass. Frederick Law Olmsted, President. Flavel Shurtleff, Secretary. A Seminar for the Discussion of City Planning Problems. Publishes Annual Proceedings. Membership at \$5 a Year Includes All Literature.

## Organized Charity

American Association of Societies for Organizing Charity. Francis H. McLean, gen'l sec'y., 105 East 22d St., New York City.

To promote the extension and development of organized charity and of community co-operation in social programs, in the United States.

## Church and Country Life

Department of Board of Home Missions of Presbyterian Church. Warren H. Wilson, Supt., Anna B. Taft, Asst., 156 Fifth Ave.; makes sociological surveys of rural populations; conferences, graduate summer schools for country ministers, literature for rural workers.

## Baptist Social Service

Baptist Department of Social Service and Brotherhood.

To study social questions, publish findings, suggest ways whereby Christian men may become socially effective, and co-operate with similar bodies.

S. Z. Batten, Secretary, 1701 Chestnut Street, Philadelphia.

## Episcopal Social Service

The Joint Commission on Social Service of the Protestant Episcopal Church.

For literature and other information address the Field Secretary, Rev. F. M. Crouch, Church Missions House, 281 Fourth Avenue, New York City.

## Congregational Social Service Agency

The Congregational Brotherhood of America, Henry A. Atkinson, Secretary, 19 S. La Salle Street, Chicago, Ill. Programs and information furnished. Study Course: Speakers' Bureau; Publications. Service available for Institutes, Conferences and Addresses. Correspondence and inquiries invited.

## Immigration

National Conference of Immigration, Land, and Labor Officials, 22 East 30th Street, F. A. Kellor, Sec. Information affecting aliens after admission, especially in reference to labor, land, education, protection and distribution. No matters of admission or restriction dealt with.

## Remedial Loans

National Federation of Remedial Loan Associations, 31 Union Square, N. Y. Arthur H. Ham.

Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

## Immigration

North American Civic League for Immigrants, New York-New Jersey Committee, 95 Madison Ave., N. Y. C. Protection, Education, Distribution and Assimilation of Immigrants. Printed material furnished upon request. Grace E. J. Parker, General Secretary.

## THE PITH OF IT

**"BETTER** be careful than crippled," said a railway safety expert. He expressed the dominant view of the First Co-operative Safety Congress. P. 222.

**A**MERICA is looking for instruments to develop her citizens and isolated communities into a real "body politic." Is the pageant a tool to her hand? Can it be used in metropolis and village alike? Can it be made to pay for itself? Philadelphia, says William Chauncy Langdon, has by her historical pageant, performed before thousands, answered these questions in the affirmative for the large city. P. 215.

**"BOY WANTED"** shouts the factory to the school and every Tom, Dick and Harry, and now-a-days Sadie and Nellie too, drops textbook and at the age of twelve or fourteen rushes out to a job. Months later, often years, they are right where they started. The remedy, it is being insistently declared, lies in a bracing up of industry and a reconstruction of education. P. 225.

**I**N purchasing what will be the first city farm for inebriates in the United States, New York chose 800 acres where agricultural and industrial occupations will be supplemented by direct contact with nature. P. 209.

**T**HERE is a factory in New York where molten lead is employed as a tempering agent. Nine men work there. It has been in operation one year and during that time nine men have had lead poisoning. Yet the paymaster asked: "Why! Is lead dangerous?" Some evidence that it is. P. 229.

**SUFFERING** in the Balkans is intense. The sick and wounded will need care for weeks and cholera is adding its horrors to one of the bloodiest of modern wars. Every country involved has appealed to the American Red Cross for aid. P. 212.

**T**HE question "Who owns the church?" is going to be emphatically answered "the whole people," says Rev. Joseph Ernest McAfee, and when the owners take hold religion and politics will no longer be carried in separate sealed compartments. Only this week, as Graham Taylor points out, the federated protestant churches have shown their concern with conditions which affect civic patriotism as deeply as they touch religious idealism. P. 234.

**O**UT of the uncertainty and half-knowledge which shroud the eugenics movement to-day there stand forth a few established facts. On these we must move a step at a time in our progress toward race betterment. Amey B. Eaton, of the Department of Social Science, University of Utah, reviews the leading features of the movement on page 242.

## THE COMMON WELFARE

### FIRST CITY FARM FOR INEBRIATES

The site for the first municipal farm for inebriates in this country was recently purchased by New York. State farms exist in Massachusetts, Iowa and Minnesota, the last having adopted this method of caring for inebriates only a short time ago. Buffalo is agitating the question of following New York's example, and those who favor the move are hopeful of securing action this winter.

The New York Board of Inebriety, appointed in accordance with an amendment to the city charter passed two years ago by the state legis-

lature, chose a farm of 800 acres in Orange County, near Greycourt, sixty miles from the city. The next act of the board, it is said, will be to fit up buildings for fifty inmates, who will then be used in the construction of new buildings, doing the necessary grading and clearing.

Orange county is in the best agricultural district in the eastern part of the state and the site chosen is declared to be one of the best farming tracts ever devoted to institutional purposes in New York. It has on it 150 acres of black fertile soil, the bottom of an old glacial lake. This is well adapted to truck gardening and commands high prices in the land market. In addi-

WHERE NEW YORK CITY WILL CARE FOR HER INEBRIATES

tion the farm has much tillable and meadow land. There are three sets of farm buildings, an old manor house and one other dwelling, built of brick made from clay underlying some of the lower meadow land, and a lime kiln valuable for agricultural and building purposes. There is some good building sand. The water supply consists of springs, and two-thirds of a 200-acre fresh water lake lies within the property. This adds to the attractiveness of

THE OLD MANOR HOUSE

Built long ago of bricks made from clay taken from lowlands on the farm.

the scenery and offers splendid sloping sites for buildings and cottages.

In accordance with the law creating the board, it is charged with the duty of "providing a hospital and industrial colony for the care, treatment and occupation of inebriates." It is also charged with the general supervision of the problem for public intoxication and inebriety for

the whole city. It thus becomes its duty to provide probationary help to all persons convicted

the whole city. It thus becomes its duty to provide probationary help to all persons convicted

CONTACT WITH NATURE IS NATURE'S CURE FOR BREAKDOWNS

This shows one chance which the farm will give the inebriate. Agriculture and industry in wholesome surroundings will also form essential parts of the treatment.

of public intoxication in the police courts of New York.

The creation of a municipal board with such duties is regarded as an encouraging sign that city and state governments are rapidly realizing the necessity of rational treatment of inebriety and vagrancy as well as of other minor offenses. The effect of the board in New York on the treatment of other offenders is already marked. The chief magistrate of the police courts has already urged the creation of a similar colony to deal with women offenders, such colony to take the place of the present workhouse. The idea that the city must discontinue sending its vagrants and petty offenders to the workhouse and must provide colony treatment for them also is rapidly gaining ground throughout the nation. In New York the site for a state farm for vagrants has already been procured. Since the purchase of the New York farm for inebriates Bailey B. Burritt, assistant secretary of the State Charities Aid Association, said: "The progress in the direction of providing wholesome surroundings, supervision of offenders by men of large ability and kindly human interests, and the provision of occupation for all, though at times seemingly slow, is very real."

#### BEER AND BLINDNESS

Thursday morning, February 9, 1911, John O'Neill and another man went to work in a New York brewery varnishing the inside of vats. Sunday morning, three days later, dawned to find John O'Neill dead and his companion totally blind.

The terrible swiftness with which this calamity made its appearance was due, according to the June, 1912, *Bulletin* of the New York Department of Labor, to the use of wood alcohol in its varnish and to the lack of ventilation in the enclosed vats where it was being applied. The *Bulletin* states:

"These vats were of wood like great casks eight or ten feet high with no openings except a small one at the top a few inches in diameter for the entrance of pipes and an oval opening in the side at the bottom slightly larger than a man's body through which a workman could enter by crawling prone. On the first day the men worked from 7 A. M. to 5 P. M. Thirty minutes were required to varnish a vat, after which the workers had an interval of twenty minutes in the open air. The usual time allowed between working periods was

thirty minutes, but in this instance only twenty minutes were allowed." On the second and third days the men worked only from 10 A. M. to 5 P. M. with the same rest periods as before.

Frank Marshall White in *Fair Play*,<sup>1</sup> tells the story of the tragic death of John O'Neill. The physician's death certificates gave epilepsy as the cause. The deputy coroner, Dr. Weston, was not satisfied and performed an autopsy.

"Your husband did not die from epilepsy, but as the result of wood alcohol poisoning," Dr. Weston told Mrs. O'Neill after he had made the post mortem examination.

"And then the horror of the situation was revealed. It seems that the varnish or shellac with which the insides of the brewery vats are coated may be made either with wood alcohol or with grain alcohol. Grain alcohol costs three dollars per gallon, while the same quantity of wood alcohol costs only fifty cents. It requires about six gallons of varnish to coat the inside of each vat, so that by the use of wood instead of grain alcohol some fifteen dollars per vat may be saved. Hence if a brewery contains several hundred vats, the saving in the use of the cheaper alcohol amounts to a considerable sum. However, while wood alcohol makes just as good a varnish for brewery purposes as grain alcohol, wood alcohol is an active poison and almost certain to cause blindness and death to the workmen inside of the vats if they are subjected to its fumes long. O'Neill had become blind before he sunk into the final stupor on the night before he died, as is shown by the fact that he thought his wife had put out the lights in their living room."

Suit was brought against the brewing company in both cases and each has been settled out of court for "a very substantial sum."

The Department of Labor has issued a pamphlet telling the story of these cases and has sent a copy to every brewer in the state with this accompanying explanation and warning:

"The article is being sent to all proprietors of breweries in this state in order to bring to their attention the danger to employees attending the use of wood alcohol in such work. The case here described would seem to make it clear that both motives of humanity and possible liability for damages ought to lead brewery proprietors to use every means to avoid such apparently easily preventable disasters."

Another way of avoiding such risk is to use vats lined with enamel or glass. Varnishing then becomes unnecessary; the

WOODEN BREWERY VAT

The workman has to crawl through the oval man-hole near the bottom in order to varnish the interior. Some of the vats are ten feet high.

<sup>1</sup>*Fair Play*, April 20, 1912.

interior can be washed out from time to time with a hose, and both the workman and the public are protected. The more progressive brewers are now using these sanitary vats.

#### SUFFERING IN THE BALKANS

The possibility of an early armistice in the Balkan war in no wise diminishes the need of money to care for the sick and wounded. Suffering will continue during many weeks and the troops will in all probability remain under arms in the field throughout a severe winter. Requests for assistance have been received by the American Red Cross from the Red Cross Societies of the four Balkan states and from the Turkish Red Crescent Society. The Greek Red Cross asked that surgeons, nurses and medical supplies be sent. The Montenegrin Red Cross asked for surgeons. The other societies asked for money.

The American Red Cross at first considered seriously the sending of field hospitals fully equipped with nurses, surgeons, tents, medicines, etc. This idea was abandoned, however, because it would probably have been impossible to send a field hospital to each of the contending countries and because, further, the indications have been that the war would be of short duration and the time required for assembling field hospitals with their proper personnel and forwarding them to the seat of war might have delayed the arrival of the assistance until after the close of the conflict.

President Taft, as president of the American Red Cross, early issued an appeal to the people of the country to contribute toward the fund for the relief of sick and wounded soldiers. This appeal reached the press on the night on which Theodore Roosevelt was shot in Milwaukee, with the result that most newspapers omitted its publication altogether and those which did give it space cut it to an inch or two and it was practically lost to the public. Another appeal followed from the International Relief Board of the Red Cross. It was not until the war had been in operation for several weeks that the American people began to appreciate the tremendous hardship and suffering which were resulting from it. All advices, both to the Red Cross and to the press of the nation, indicate that it has been one of the bloodiest and most fiercely contested wars of modern times. The intense spirit of patriotism which has characterized the countries engaged is evidenced by the statement that substantially every able-bodied man in Serbia has volunteered to fight. In the other states the patriotism and valor has been no less notable. Turkey, as the object of attack from four adjoining states and as the losing combatant, has been the heaviest sufferer. Famine has followed in the wake of invading armies

and terrible distress is reported among the non-combatants. To make matters worse an epidemic of cholera has apparently made its appearance among both Turkish and allied troops. Information on this point is fragmentary and unreliable but our embassy at Constantinople has reported to the American Red Cross that the disease has assumed menacing proportions. Press dispatches declare that Turkish soldiers holding the line of fortifications at Tchatalja, in front of Constantinople, suffered heavily from it and that it quickly spread to the attacking Bulgarian troops. An eye-witness is said to have declared that he saw 263 corpses dragged by hooks and dropped into one trench in a single day.

Now that the election is past and the reports of frightful suffering in the Balkan peninsula are being verified it is believed that the response of the American people will be generous. On Tuesday the Red Cross had sent \$41,000. Contributions may be sent to the American Red Cross, Washington, D. C., to Jacob H. Schiff, New York, or to any state or local treasurer of the Red Cross with instructions as to the destination desired.

Queen Olga of Greece has appealed to the Greek newspaper published in New York for aid for the stricken women and children who have been left destitute by the depredations of Turkish troops before abandoning the villages and towns to the conquering armies.

## THE BULGARIAN IN AMERICA

PETER ROBERTS

Secretary International Committee Y. M. C. A.

Ten years ago, the Bulgarians in America were few and far between; today, it is estimated that they number about 30,000. They are among the newer immigrants and are subjected to all the inconveniences of a people finding out the nature of a new country. Not all Bulgarians come from Bulgaria; many come from Macedonia. They are brothers, but as among other immigrants, many jealousies and conflicts are found among those coming from different localities. Nowhere in America is the Bulgarian as much at home as in the vicinity of St. Louis. Here some 6,000 are scattered in St. Louis, East St. Louis, Collinsville, Madison and Granite City.

The Bulgarians first settled in this community in 1904 and since then their number has steadily increased until these days of conflict, when hundreds have returned to take up arms against the Turk. With the growth of the industrial plants on the Illinois side of the Mississippi, these people came, and at present they form the bulk of the foreign-speaking labor in the American

Steel Works, the Commonwealth Steel Works, the Rolling Mill, the Glucose Mill, the Stamping Works and the Lead Plant in Granite City. The American Car and Foundry Plant and the Rolling Mill in Madison depend upon them for labor; while they form an essential part of the steel plant and the aluminum works in East St. Louis. The Bulgarians are good workmen and compare favorably with any people coming from agricultural communities to industrial plants.

There are but few women among the Bulgarians in America; hence the stag boarding-house is common among them. In Granite City,

HUNDREDS LIKE HIM HAVE GONE HOME TO FIGHT THE TURK

they live almost wholly in Hungry Hollow. Few of the people live in the city proper. The Bulgarian doctor and lawyer, the two dentists of that nationality, the editors of their four papers and a few business men are found in the city, but the people, as a whole, live in the Hollow. Stag boarding-houses are not clean. Fifteen or twenty men live in a few rooms, cook their own meals, do their own washing and what cleaning they can. There are a few women among the thousands of men. They are more nearly slaves than

anything else, for they keep boarders, run beds double shift when the plants are full handed,

BEFORE-THE-WAR SMILES

A group of Chicago Bulgarians. The emigration of these people is said to be due chiefly to economic oppression.

and prepare meals at all hours. Bulgarian women, though strong, cannot long stand this kind of life—they sacrifice their lives, driven to the drudgery of a boarding-house by the greed of their husbands.

The Bulgarian is fond of social life. There are some saloons among them, but they are not drunkards as many of the Slavic peoples are. The Bulgarian is temperate. In his native country he drinks the fruit of his native vines. Some of this wine is imported to America, but the average Bulgarian in the United States must content himself with beer. He has his coffee house in which Turkish coffee, pastry and cigarettes are sold. Here the Bulgarians spend their leisure time playing cards, pool, and indulging in other amusements.

It was in a coffee house that an editorial was read not long ago for the benefit of the group assembled. The author quoted the words of an American writer who said that the Bulgars were immoral, unreliable, and undesirable. Mirka was of the group. He had seen service in the Bulgarian army and had fearlessly fought the Turk. He asked: "Who says Bulgars are immoral?" and looked for his revolver and knife. His friends restrained him with the reminder

that he was in America now and not in Bulgaria where he could avenge an insult such as the article contained.

The Bulgarians belong to the Greek Orthodox Church, but the national church is independent of both the Greek and the Russian patriarch. They have few churches in America and few priests to minister to their needs. Many of the priests of the Russian, Servian and Greek congregations minister to the Bulgarians for they have the same ritual and the ceremonies are the same.

The Bulgarians are patriotic. The colonies in America have watched with intense interest the rise of Bulgaria into an independent nation, and the casting off of the suzerainty of the Sultan. During the present war the Turkish coffee houses among the Bulgars are the rendezvous of the aliens. The news of the triumphant march of their comrades and the defeats of the Turks are discussed and rejoiced over just as our people read and discussed war news during the Civil War. The Bulgars are a strong people and the future of the Balkans is more in their hands than in those of any other nation in that part of Europe.

AN INDIGNATION MEETING

Not only the Turk can draw the Bulgarians in America together. In the stormy days of 1908, 600 unemployed and starving Bulgarians marched on the City Hall in Chicago and demanded work. They were unsuccessful and the charitable societies had to come to the relief of many.

## CIVICS

### THE PHILADELPHIA HISTORICAL PAGEANT

WILLIAM CHAUNCY LANGDON

MASTER OF THE PAGEANT OF THETFORD (1911) AND PAGEANT OF ST. JOHNSBURY (1912)  
ASSISTANT IN THE FIELD, PHILADELPHIA HISTORICAL PAGEANT

The glory of Philadelphia was marshalled before the gaze of the assembled thousands who attended the nine performances of this pageant. All who saw it were astounded with the magnificence of the spectacle. It was a revelation. As from a mountain, people saw the history of Philadelphia spread out before them and the grandeur of it. No one who saw it can forget it. In size and kind it was comparable to the Tercentenary Celebration of Quebec and some of the large English pageants, such as York, Oxford and Cardiff.

Five thousand people from all parts of the city and its suburbs, all joyous with the infectious enthusiasm of the pageant spirit came together under the direction of Ellis Paxson Oberholtzer, the master of the pageant, to take part. Although comparatively few knew each other before, all enthusiastically co-operated to do what little or what much they could to realize a pageant that should be worthy of their city. It is important for a city to have among its citizens 5,000 people, men, women and children who would thus give freely of their vision, of their time, of their money, of their work, of their enthusiasm, of their nervous strength, in order to hold forth before their fellow-citizens and their fellow-countrymen the glory of their city.

The location, "In the Field at Belmont," the highest point in Fairmount Park, was worthy

of the occasion. From a grand-stand large enough to seat comfortably in chairs 18,000 people, the pageant grounds extended five hundred yards to the rim of red cedars where lay the farthest entrance, called "The River," just in line with the vista of the Schuylkill, seen over the forest trees of the park. Beyond lay the wide city of Philadelphia, from the center of which, the gleaming water of the river flowing directly toward it, rose the tower of the City Hall from a cluster of high office buildings. The chief requirement of ideal pageant grounds was fulfilled. The city which was the hero of the pageant was fully in view and dominated the scene. All the historical events selected for the episodes were enacted with the city itself as their abiding background.

The pageant opened with the following announcement by heralds on horseback:

"Ye who would learn the glory of your past  
And form a forecast of the things to be  
Give heed to this a city's trumpet blast  
And see her pictured life in pageantry!"

The prologue then proceeded with a dance of 500 or more little fairies or spirits of imagination under their fairy queen and a score or more lovely fairy godmothers. As they vanished the solitary figure of the Knight of Exploration and Adventure rode slowly and silently across the field. Then came Indians, gazing with curiosity and awe at the strange knight, and successively

CARLISLE INDIAN STUDENT ACTORS

the people of the three nationalities—the Dutch, the Swedes and the English—who came to the vicinity of Philadelphia before the hand and the influence of Penn brought good rule and progress out of conflict and chaos.

The episodes comprised the following events: the coming of William Penn; the granting of the new Frame of Government; the sending back of the tea-ship "Polly"; the Declaration of Independence; the battle of Germantown; the Meschianza, (that gay society tournament given under the direction of Major Andre in honor of Lord Howe during the British occupation); Franklin at the court of France; the reception of President and Mrs. Washington at Gray's Gardens; the War of 1812; and the reception to General Lafayette. The finale, a most imposing and gorgeous spectacle, followed the English custom and consisted of an undramatized assemblage of all the people of the pageant in a great tableau centering in the symbolic figures of the City of Philadelphia and the twenty-eight municipal districts. It terminated in a marvelous procession, as the 5,000 people marched by the grand-stand paying homage to the City of Philadelphia as they passed before her.

In the selection of these episodes and in the writing of the pageant book there was apparent no dramatic construction of the pageant as a whole to show the logical sequence of human cause and effect in the development of the city. Rather the series of events were chosen simply for their individual importance as historical incidents and for their adaptability for spectacular presentation. But it should be noticed that a large pageant such as this does not afford its master the largest and freest opportunities in dramatic treatment. The limitations resulting from its size are serious and render the task of the master of the pageant exceedingly difficult. He is for the most part restricted to mass effects. Individual effects are almost impossible. Notably successful nonetheless was the entrance of Benjamin Franklin in the French court scene. On the other hand, the large scale made possible

the battle of Germantown; and the long entrances produced the fine series of approaching and receding processions which with the fine and varied costumes and the flying banners added so much to the epic quality of the pageant.

The direction of the pageant was well organized and thoroughly specialized. In addition there was a heartiness of co-operation among all which made success inevitable. Of many of the employes it could be said that they threw themselves into the work as untiringly as if they were doing it simply for love; and of many of the volunteers it might be said that they could not have worked harder or more devotedly if they had been paid. Many of the arrangements were necessarily quite extemporaneous, but while there was of course abundant need for administrative alertness, all went with remarkable smoothness both on the field and behind the scenes. Endlessly interesting were the arrangements for lighting the pageant grounds; the city of 75 dressing tents back among the trees; the provision for the repair of costumes, for the care of the wigs, for the cleaning of the rifles, for the stabling and feeding of the horses; and the telephone system by which the master of the pageant or the stage manager directed to a nicety the entrance of the performers, the firing of the cannon, or the changing of the scenery.

The use of theatrical scenery in a pageant is, in the opinion of the writer, open to serious question, although it may be that in so large a production, where the human beings are reduced to such slight proportions in the scene, something large like a house is needed to emphasize the different individuality of the various episodes. However that may be, in this instance the pageant was written with scenery in mind and could not have been produced without it. Furthermore, it should be cordially said that the excellence of some of the stage structures, such as Independence Hall, raising its tower sixty-five feet into the air; the Chew Mansion; and the ship of state, Union, made by the people of Philadelphia for the celebration of the ratification of the Constitution in 1787 and used by them again in the reception to Washington, made a strong argument in favor of their general use. All the scenery, the vehicles such as the Washington coach and the Lafayette barouche, and the other properties were made at the Pageant House under the direction of Henry Kabierske, the stage manager, who of course also conducted the rehearsals and had charge of the general dramatic management.

The costuming was notably correct. In order that it might be accurate, all but a few of the 5,000 costumes were made at the Pageant House under the direction of Charles H. Stephens, the artist who had charge of all matters of color

and design in the pageant, and of Mrs. Margaret McHenry, the mistress of the wardrobe. As chairman of the costume committee, Miss Elizabeth McClellan, the authority on American costume, was ready to pass upon doubtful questions of historic fashion; and Charles M. Lefferts lent the aid of his intimate knowledge of military uniforms and usage. In this example of reliable correctness in the costuming, the Philadelphia pageant made a helpful contribution to American pageantry.

The music of the pageant consisted partly of the revival of old music appropriate to the episode, such as the military marches, Brandywine and The State Fencibles March, and partly of new music, both choral and instrumental, composed by Prof. Hugh A. Clark of the University of Pennsylvania. Unfortunately the acoustics proved to be bad, and in consequence the band and the chorus, located in the front of the middle section of the grand-stand, could not be heard at all. The dances were of the formal type. They were planned and trained by Albert W. Newman. The minuet in the French court scene and the pastoral dance in the episode of the reception to President and Mrs. Washington won deserved applause.

The value of the Philadelphia Historical Pageant to the country at large consists in its answer, so far as it went, to the question, Is it possible for a large city to have a real pageant? Can this joyous new form of drama do anything tangible to unite the hundred-thousands and the millions of our great American municipalities in a common pride in their history and in a hopeful attitude toward the future? Bringing it right down to its clearest form, this means, can a pageant pay its own expenses? The whole

GENUINE PRAIRIE SCHOONER USED

future of pageantry in this country comes down to this one practical question. If it cannot pay its own expenses, the pageant as a factor in the up-building of a wholesome American community life is of little value. It is a beautiful luxury, which but few communities can or will afford. But if such a pageant with careful business management can cover its own cost, the pageant is a powerful force, a practical means for the realization of illimitable possibilities in the future. It will do much to help bring about a finer, greater, more democratic life than we have as yet even dreamed.

America began with communities that were merely accidental gatherings of individual people, isolated and self-reliant and independent. America has taken these communities and developed these people into a co-operation in their so-called public affairs, making of them a "body politic." America is now developing them into a social body, getting them together in their daily life and on the common ground of their human interests simply as men and women.

She is looking for instruments to further this work. Is the pageant a tool to her hand? Can it be used anywhere and everywhere, in large cities and in little villages? Will it pay for itself? Or can it be made, with more experience, to pay for itself? So far as this question applies to large cities, Philadelphia has said it can.

It is on account of the final importance of this question that I feel that the supreme service of Dr. Oberholtzer in this pageant has been in ordering and marshalling the work as a whole, as at once a work of art and as a business enterprise. This successful conduct of a great city pageant is a contribution to the development of American life for which the rest of the country owes appreciation. It was a stupendous task, and it could doubtless have been done in many ways, so far as pageant-writing or stage production

BEHIND THE SCENES

are concerned, as many as the number of the people who might have attempted it. Surely unavoidable guess-work and blind-fold decision have strewn the path of Dr. Oberholtzer and his pageant committee with the failure fragments of many hopes and plans and experiments, of which the public cannot be aware. Their path was along no beaten road, but through unblazed forest and underbrush. But the Philadelphia Historical Pageant of 1912 has come through. And there remains—to Philadelphia a vision of a work of art and of history that is hers, and to the rest of the country, to America, the message that the dramatic art of the people has arrived at the gates of her large cities.

CINCINNATI'S BUDGET EXHIBIT

"We know of no event in recent years that has been such a boost to Cincinnati as the Municipal Exhibit, teeming with the multiple interests of a large and well-governed city, giving convincing proof of the value of honest administration and without full of the throbs of human interest."

Citizens generally echoed this declaration of the Cincinnati *Post* and agreed that much credit was due to the Bureau of Municipal Research for organizing and directing the exhibit. It met with hearty response and approbation on the part of the public as evidenced by an attendance on some days of 10,000 visitors.

Every department of the city as well as the Board of Education and certain charitable agencies was represented. Besides a desire to educate the citizens of the city in municipal problems, the main object of the administration was to stimulate interest in an extra tax levy for use in 1913. Under Ohio laws only 1 per cent may be levied directly upon taxable property for all purposes—state, county and city. In addition to this a tax for a sinking fund may be levied and if that, plus the 1 per cent already mentioned, does not equal 1½ per cent, enough more to reach that amount may be levied if the people authorize it in a referendum. The amount of the extra levy requested for 1913 is less than the amount voted a year ago. If the levy had not been authorized by the voters on election day the six main departments would have had their budgets reduced by over \$1,100,000.

Public Health .....	\$ 38,450	3.39	per cent
Safety .....	566,164	49.81	" "
Social Service .....	274,574	24.16	" "
Hospital .....	124,635	10.65	" "
Parks .....	75,807	6.65	" "
University .....	57,212	5.03	" "

Some of the objects for which the money is to be spent are public concerts, a bureau of efficiency, a university night school, seven district physicians to look after poor people who cannot afford their own doctors, ten visiting school nurses, seven dentists to look after the teeth of school children and more tenement house and building inspectors.

Among the popular exhibits were those of the purchasing department which was reorganized in January and has saved nearly \$100,000 for the city by the introduction of real competitive bid-

PICTURING MUNICIPAL SOCIAL SERVICE

ding, the standardization of supplies, better prepared specifications, wholesale buying and careful inspection.

One chart entitled "soap and water," and typifying modern methods in the department, showed how the city used to sell one hundred gallons of water for one cent and then buy it back in liquid soap at thirty cents a gallon; now instead of buying soft soap at four and a half cents a pound, it buys soap chips at five and a half cents a pound, uses its own water at one cent per one hundred gallons and mixes the soap at two and one-third cents a pound, a saving of 55 per cent.

Since January an increased effort has been made to better housing conditions through the tenement house bureau of the building department. The exhibit of this bureau showed numerous photographs of housing conditions in Cincinnati as well as several charts comparing the city with others of approximately its size. From one of these it appeared that in Cincinnati 44 per cent of the families live in tenement houses. Buffalo which ranked next highest has a record of but 24 per cent, while Columbus, Detroit, Indianapolis and Toledo all have less than 10 per cent.

The new Department of Charities and Correction disclosed the fact that in 1911, 60,000 drinks of whiskey were given infirmary inmates to encourage them to work. This has been stopped. The department also issued a special number of the *Charities' Department Bulletin*, of which some 100,000 were distributed. These helped in creating public sentiment in favor of moving the House of Refuge into the country. A straw ballot at the exhibit showed 13,360 in favor and but 136 against. The ballots were printed by the boys in the House of Refuge on a hand press, which was moved to the exhibit.

The Health Department in its exhibit emphasized the subjects of food and medical inspection. A realistic feature was an infant milk station in full operation. The exhibit was an interesting display of big work already done, of bigger work under way and still larger achievement in contemplation.

## SECOND HOUSING CONFERENCE

The Second National Conference on Housing will be held in Philadelphia beginning on December 4. The conference will last three days and will end with a banquet. There will be two sessions a day as well as inspection trips and round-table luncheon discussions. The regular sessions are to consist of two twenty-minute papers. Each will be discussed by four announced speakers before the subject is thrown open to general discussion from the floor for twenty minutes, making about two hours for each session. At one meeting no papers will be read. Instead there will be free discussion of five previously announced live topics. Speakers will be limited to five minutes.

Philadelphia was selected as the place for the conference because the National Housing Association believes that Philadelphia has more to show the housing workers of the country in the direction of constructive effort than any other American city. In its multitude of small houses, the absence of tenements, its economical and advantageous lot units, its system of minor streets, its Octavia Hill Association for improving the older houses, Philadelphia is unique. The opportunity for studying these things at first hand is one that every housing worker is urged to seize.

In arranging the program this year, it was sought to get as far away as possible from New York conditions; to discuss problems that are national; to extend the field of operations so as to include not only the large city and the small town, but suburban and rural sections as well. It was also the aim to have these subjects, so far as practicable, discussed by persons who did not read papers last year and to bring into the announced discussions housing workers from all sections of the country.

The first paper, Health Departments and Housing, will be presented by Charles B. Ball, chief sanitary inspector of the Chicago Health Department. Mr. Ball's long experience in sanitary work in Washington and New York as well as in Chicago makes him an authority on a subject which is receiving increased recognition. This new receptive attitude of health officers toward housing led to the work of Dr. George T. Palmer, whose housing survey of Springfield, Ill., last year attracted national attention. It led Dr. Charles J. Hastings, the medical health officer of Toronto to publish a report on the housing conditions in his city which spurred that Canadian capital to constructive activity. It led Dr. James Roberts, medical health officer of Hamilton, and other health officials to demand and get improvements in their cities. These men will go to Philadelphia to discuss Mr. Ball's paper and to contribute from their experiences.

Other papers that will be presented are: Garden Cities by Grosvenor Atterbury, fellow of the American Institute of Architects and designer of the Russell Sage Foundation suburb, Forest Hills Gardens; Instructive Sanitary Inspection by Johanna von Wagner, whose work in teaching the poorer immigrants a higher

standard of home making has given her a reputation both in the East and on the Pacific Coast; Regulation by Law, by Albion Fellows Bacon, secretary of the Indiana Housing Association and author of the Indiana Housing Law; and Property Divisions, Lot Depths and Height Regulation, by Andrew Wright Crawford, a member of the City Planning Conference who is interested in Philadelphia's development.

A number of the papers deal with the fundamental problems underlying our housing evils and with the most promising methods of solution. Lawrence Veiller, secretary of the National Housing Association and author of the New York Tenement House Law will present a solution for those universal twin problems, room overcrowding and the lodger evil; John Nolen, a city planner of wide experience, will discuss the vexed question of the relation of the factory and the home, giving his opinion as to whether the factory should go to the outskirts, or the people be brought to the center. His opinion must be well supported by fact to stand unchallenged for among those who will comment upon it are Irving Bush, head of the Bush Terminal Company, which has sought to reduce waste of time and effort by putting home and factory close together on the outskirts, and John Martin who has made a thorough study of the value of efficient rapid transit.

But whether the factories go to the outskirts or not there still will be many workmen's homes near the heart of the city and there will continue to be an increasing number erected on the outskirts. John Ihlder, field secretary of the National Housing Association, will discuss the best types of houses for these different locations. His suggestions will be commented upon by Alfred T. White, owner of the Riverside Buildings in Brooklyn; Dr. George M. Kober, secretary of the Sanitary Housing Company, which has built several hundred model workmen's houses in Washington; Charles A. Beck, secretary of the Woodlawn Company of Wilmington, Del., which has erected some of the most successful one- and two-family houses in America; and J. G. Schmidlapp, who is now doing for Cincinnati what the Sanitary Housing Company has done for Washington.

Last comes that most important question, the financing of the small house. This will be presented by one of the leading building and loan association men of the country whose views will be discussed by such men as Frank Bailey, vice-president of the Title Guarantee and Trust Company of Brooklyn; John L. Fry, one of the leading builders of Philadelphia; Alfred L. Aiken, president of the Worcester Savings Institution, whose belief in the small house as a community asset has led him to throw all his influence in favor of the single family dwelling as opposed to the tenement house; and by Lee K. Frankel, of the Metropolitan Life Insurance Company, who has charge of one of the most interesting social developments in America, the building of good workmen's dwellings by a great insurance company, not as a philanthropy, but as a business proposition.

EVIDENCE OF CARELESS WORKMANSHIP

### A FABLE FOR BUILDERS

To emphasize the fact that defective flues are among the most frequent causes of preventable fire, the National Fire Protection Association has prepared the following:

#### A FABLE FOR BUILDERS

"Last Summer a Good Citizen of a certain town not over a hundred miles from almost Everywhere, built a Wooden house for a Woman and her Children. He built the Chimney of Brick because he had to. The Chimney was able to Stand Alone, so he did not have to prop it with Wood. But the Floors of the house would not Stay Up without props. The Good Citizen saved a dollar by using the Chimney as a support to the floors. He nestled the ends of the Floor Joists nicely in the brick of the Chimney. He covered up the job and got his money.

"The Rains fell and the Winds blew in the most Biblical manner, and Winter came after its fashion. The Chimney Settled a little; and there was a tiny Crack.

"One morning the Woman woke up with Fire All About her. She tried to get to her Children. If she got to them no one Ever Knew it. The Good Citizen who built the house was Not Arrested for Manslaughter. He is building Other houses of the Same Kind for Other women and children.

"He is making his Living by it."

Because fires from defective flues start underneath roofs, back of ranges, under hearths and in other places not in plain view, does not mean that there is anything hidden or mysterious about them or anything which cannot be readily understood. The following recommendations, the association says, if followed, will help to guard from fires the lives and property of every houseowner:

"1. Build all chimneys from the ground up. None of their weight should be carried by anything except their proper foundations. Foundations should be at least twelve inches

wider all around than the area of the chimney and be started well below the frost line.

"2. Build all chimneys to a point at least three feet above flat roofs and two feet above the ridge of peak roofs.

"3. Never build a chimney wall less than eight inches (two courses of brick) in thickness and use only cement mortar up to the first floor and above the roof line.

"4. Build all chimneys large enough to give a separate flue for each fire, using fire clay or terra-cotta tile linings at least one inch in thickness.

"5. Do not run floor joists or other woodwork into chimneys or flues nor allow wood casing, lathing or furring within two inches of chimney breasts.

"6. All floor timbers should be 'trimmed' clear of the hearths and brickwork of the chimney, so as not to be in contact with it at any point."

If these rules are followed the smoke, flame, heat and gases of combustion will not diverge from the straight and narrow path to the outer air by leakage through the sides of the chimney.

### JOTTINGS

#### SCHOOL CIVICS IN NEWARK

Problems of transportation and their solution, city planning, the water supply problem, street paving, city cleaning, sewage and its disposal, the Essex County park system, police department and fire department are the subjects covered in a series of pamphlets issued by the Board of Education for the study of Newark in the schools of the city. These pamphlets on municipal civics are arranged by Frank C. Gilman, head of the Department of History of the Barringer High School. They furnish the pupils and the general public with a short statement on each subject, explaining the importance of the problem considered, the history of its treatment in Newark and the needs still to be met by the city.

#### RICE INSTITUTE STARTS WITH \$10,000,000

Few institutions of learning have begun their existence under such auspicious financial circumstances as the William M. Rice Institute, which opened its doors this fall at Houston, Texas, with an original fund of \$10,000,000 for endowment and maintenance.

Rice Institute was made possible by the gift of William Marsh Rice, a native of Massachusetts, but for many years a resident of Houston. Before his death in 1900, Mr. Rice made plans for the establishment of a nonpolitical and non-sectarian institution to be dedicated to the advancement of letters, science, and art. During the long period of litigation that followed Mr. Rice's death, the trustees called Dr. Edgar Odell Lovett, a professor in Princeton University, to aid them as president in realizing the founder's wishes. President Lovett traveled all over the

world in the interest of the new enterprise, visited the leading educational and scientific establishments, and returned in the summer of 1909 from a year's journey of study that extended from England to Japan.

Meanwhile the trustees had secured 300 acres of land on the extension of Houston's main thoroughfare as a site for the institute. This fall building operations had progressed so far that it was deemed advisable to hold formal dedication exercises and to open the institution to students. The institute will be for both young men and young women. There will be no charge for tuition and no fees.

#### LABELLING SCHOOLHOUSES IN ILLINOIS

Labelling country schoolhouses so that every citizen may know whether his school is up to standard is the device of the Illinois state school authorities.

The schools are inspected as to grounds, building, furnishings, heating, ventilation, library, water supply, sanitation and the qualifications of the teacher. If the essentials of a good school are found a diploma is granted the district and a plate is placed above the door of the schoolhouse, designating it a "Standard School." Already 657 of the 10,532 one-room schoolhouses in Illinois have earned the right to the label.

Illinois does not merely ask that the schools be brought up to standard; the state tells how it can be done. Among the specifications are: An ample playground; improved heating arrangements—a jacketed stove in the corner of the room instead of an unprotected stove in the center; suitable desks for children of all ages properly placed, and a sanitary water supply.

The Illinois authorities do not expect to see this movement for betterment of the one-room schools interfere with the natural development of consolidated schools.

#### NEWARK LIBRARY A SOCIAL CENTER

In the movement for getting the maximum of use out of a city's public educational building, John Cotton Dana of the Newark Public Library enters a claim for his city as pioneer in liberality and extent. In the *American City* he says:

"We have had some or all of the building open for public use every day in eleven years save about twenty-five; and a total of 50 per cent more hours than any other public building in the city, and more than three times as many hours as the schoolhouses. While the building was thus open, the people of the city held in the spare rooms mentioned, in eleven years, about 6,000 meetings, by and for nearly 700 different organizations, with a total attendance of about 180,000. These meetings ranged from boys' debating clubs to the Board of Trade, and covered such subjects as city planning, charity, hospitals, pedagogy, tuberculosis, philosophy, languages, and the world's peace. As long as there was a room unused, any public welfare educational movement, not looking for money profits to any individual, could find free of

charge for its orderly meetings a warm well-lighted and properly janitored room in the library building. On many days ten such meetings have been held."

#### A CITY PLANNING SEMINAR

At the request of the University of Illinois, Charles Mulford Robinson is spending a week explaining to the class in landscape architecture what city planning is and how to go about it. Under Mr. Robinson's direction the students are making a study of the twin cities of Champaign and Urbana, where the university is located. No attempt, of course, will be made to complete a full-fledged town plan for these cities in a week but as far as the work goes it is practical and concrete. The purpose of the special seminar is to stimulate interest in this growing science so that when the students begin their professional careers they may have an intelligent appreciation of the scope and benefits of city planning and of their relation to it as landscape architects to whom the detail work of planning such features of a city beautiful as parks and playgrounds is properly referred.

#### A BOARDWALK FOR CONEY ISLAND

"Keep hammering" is the motto which the West End Improvement League of Coney Island has adopted in its campaign for an immense boardwalk or ocean promenade similar to that which has made Atlantic City famous. Practically neglected by the city the West End section of Coney Island was until recently an area of sand dunes, scattered houses and a few eleemosynary institutions. More recently hotels and bathing establishments have sprung up like mushrooms until now in all this section there is but one street, West Twenty-third, which is physically and legally opened to the beach. The beach itself, also, is encumbered by barriers which prevent people from being able to walk along it for any considerable distance. The carrying out of the plan advanced by the league involves a rebuilding and moral cleansing of the notorious Bowery section of Coney Island.

The general scheme of a boardwalk as proposed by the league is as follows:

1. That the city acquire by condemnation or cession that strip of land lying between the high water line of the Atlantic Ocean and a parallel line 160 feet upland of the said water line and extending from the Dreamland property to West 37th Street, together with all rights to land under water contiguous thereto.
2. That a boardwalk be built sixty feet in width and covering the further upland portion of the area first mentioned.
3. That the land and boardwalk when built be put under the control of the Park Department.
4. That the boardwalk be built of a height above the grade level to permit of a basement story to all buildings abutting on the land side of the boardwalk.
5. That the entire beach be kept free from all obstructions to the view from this boardwalk.
6. That all streets be opened to the boardwalk.
7. That Coney Island be put within the fire limits.

## INDUSTRY

### CAMPAIGNING FOR SAFETY

C. W. PRICE

ASSISTANT TO WISCONSIN INDUSTRIAL COMMISSION

The First Co-operative Safety Congress, held at Milwaukee September 30 to October 5, under the auspices of the Association of Iron and Steel Electrical Engineers was a gathering of hard-headed shopmen and employers awakened to the shame and waste of the old hit-or-miss way of protection against accidents and enlisted in the new movement for the conservation of human lives. To read the program, with the names of speakers and titles of papers, is to gain no notion of what happened at Milwaukee; for it was a meeting of enthusiasm, and enthusiasm cannot be reduced to white paper and cold type.

What I want to do is in some way to suggest the spirit of the congress, the conviction of what can be done and what must be done to save human life, and the splendid spirit of co-operation manifested between employer and employe in this common cause. And then I want to state in a few words the half-dozen fundamental principles which have become the rules of action with all the experienced men who are conducting the campaign for safety in the various industries of the United States.

Just think of a hard-headed railroad attorney, recently appointed to organize the safety movement on a great railroad, saying things like this—even printing them in a book of rules issued as orders and distributed over the entire system:

"Every great and commanding movement in the annals of the world is a triumph of enthusi-

asm. Whether a movement tending toward safety in industrial operation, or, in other words, a movement *for the conservation of men*, is a great and commanding movement depends, perhaps, upon the point of view from which the subject is considered; but if, as to most of us, life is the most precious of our possessions, any movement for the preservation of life ought to be a great and commanding one, and should be enthusiastically supported by every workingman as well as by every employer, and with such support it must necessarily be successful. Human lives and human limbs are of much more importance than money."

The author of this is Ralph C. Richards of the Chicago & Northwestern Railway, who presided at the session on transportation. Mr. Richards is the pioneer in railroad safety work. Here are more things he said as he stood before that body of 200 railroad men:

"The golden rule in railroading: It is better to cause a delay than to cause an accident.

"It actually takes less time to prevent an accident than it takes to report one.

"It takes less time to learn to do a thing right than to explain why you did it wrong.

"Every accident is a notice that something is wrong with the man, plan or methods, and should be immediately investigated by the person in charge of the work to ascertain the cause and apply a remedy.

"In case of doubt, adopt the safe course; speed must always give way to safety.

"Better be careful than crippled."

## DEVOTED TO SAFEGUARDING HUMAN LIFE

**DAVID VAN SCHAACK**  
Director Bureau of Accident Pre-  
vention Aetna Life Insur-  
ance Co.

**C. W. PRICE**  
Assistant to the Industrial Com-  
mission of Wisconsin.

**DON D. LESCOHIER**  
Expert on Accident Prevention,  
Minnesota Bureau of Labor.

The Chicago & Northwestern Railway was the pioneer in the promotion of safety on railroads, and since the organization of its work twenty months ago, 145,000 out of a total of 240,000 miles of railroad in the United States have adopted substantially the same methods used by the Northwestern lines and have organized the work of safety throughout their various systems.

Mr. Richards stated that the Northwestern, during the twenty months, has reduced by 29.9 per cent the number of employes killed; the number of employes injured by 31.4 per cent; the number of passengers killed by 36.3 per cent; and the number of passengers injured by 16 per cent.

John Kirby of the Dayton Manufacturing Company expressed the sentiments of the manufacturers present at the Safety Congress when he said:

"The dawn of a new era in conservation is at hand. It is the workman and his family that are chiefly to be considered in this whole matter; for no amount of money will outweigh in value a single human life. A conservative estimate of the economic loss in this country through industrial accidents places it at more than \$25,000,000 each year. This is more than 20,000 workmen could earn in a twelve-months at \$4.00 a day apiece."

You cannot understand the enthusiasm and determination of manufacturers and safety men who are engaged in this work nor explain the sudden and rapid spread of this country-wide movement for safety unless you keep in mind the following two sets of facts which were brought out in the papers and discussions at the congress.

**First.**—The facts concerning the slaughter of industry in the past. The commission of labor in the bulletin of 1908 reported that 35,000 work-

men are killed in industrial accidents each year; or one for every fifteen minutes of every day in the year. And 2,000,000 men are injured each year; or one for every sixteen seconds in every day in the year. Such figures appall the mind and are enough to stir to the depths any red-blooded, human-hearted man, and to fire him with a determination to go out and stop the slaughter.

**Second.**—The facts concerning possibilities of prevention. The experience of a large number of industries during the last five years which have taken up this problem of safety in a business-like way has demonstrated that it is possible to reduce the number of days lost from injury over 50 per cent and to reduce the serious injuries and deaths from 50 to 75 per cent. One safety man in charge of safety work at a steel plant told me at the congress that during the last few years they had reduced the deaths from forty-five to six per year. It is only recently that these statistics have been available, but now the good news is spreading and it is this assurance of what can be done that is so rapidly enlisting manufacturers in this human cause.

Another point which the manufacturers are not unmindful of and which has been revealed by past experience is the fact that this conservation of human life is a good business proposition, that it pays in dollars and cents. While this was mentioned incidentally at the congress, it was the human note that was uppermost. The statement was made over and over that it is the right and humane thing to do, and ought to be done.

Steel was perhaps represented more largely in the exhibit and in the sessions of the congress than any other industry, as it should be, because it has been the pioneer in this safety movement and still leads all others in the efficiency with which it is promoting the work and in the

splendid record it has made in reducing accidents. The steel mills were the first to work out practical safeguards and effective methods of promoting safety, and it was often revealed at the congress that nearly every safety man had received his first inspiration and his most valuable instruction from this industry. I was told by one of the officers of the Illinois Steel Company that they have reduced accidents in their company over 50 per cent during the last eight years. The Wisconsin Steel Company of the International Harvester Company, in one year, with 1,300 employes, reduced serious injuries from fifty-five to eighteen, deaths from four to one, and the hours lost on account of injuries from 92,000 to 49,000. These figures are especially significant because in this industry probably more than in any other there is a larger area of hazard which cannot be covered by any mechanical guard and which must be reached through educational methods.

Out of the experience of these and other industries has come this interesting fact, mentioned in the congress: that not more than one-third of the reductions which have been made in accidents have been accomplished through the use of any mechanical guard or mechanical equipment and that two-thirds have been accomplished by other means, which the safety men call organization and education. Under organization and education are included:

*First.*—Rigid and constant inspection by inspectors and foremen, and by committees of rank-and-file workmen who are given time off each month with pay to make inspections of the shop.

*Second.*—Careful instruction of the workman in regard to the dangers of his occupation, especially of new men and of non-English-speaking men who are not familiar with machinery and with modern factories. The best instruction is furnished by the foreman in his own department, but books of rules, bulletins and warning signs posted on the walls have been found valuable.

*Third.*—Proper supervision of men engaged in dangerous work.

*Fourth.*—Discipline of men who refuse to cooperate in promoting safety. Some industries lay men off two weeks, which helps to wake them up to the realization that the company means business in this work of safety.

*Fifth.*—Booster meetings of foremen and workmen to keep up the interest and enthusiasm in the work and to discuss accidents which have happened and ways and means of preventing them.

*Sixth.*—"Boost for Safety" buttons, worn by workmen, caps inscribed with "Safety First," photographs of accidents posted on bulletin boards, bulletins circulated among the workmen

describing accidents which have happened and suggesting what might have been done to prevent them, prizes offered for departments which make a good record in reducing accidents and for workmen who are especially active. The one indispensable thing is to secure the co-operation of the employes.

These were the things, rather than mechanical guards, which were emphasized in the numerous papers read by safety men from different industries.

I have not the space to speak of the splendid work of the government, especially the safety work in coal mines, nor of the notable humane work of the National Red Cross Association, which was presented at the federal session; but I want to speak of two things more or less new and significant.

The campaign for safety by the National Association of Manufacturers was outlined at the allied associations' session. This association is organizing exhibits of safety devices, stereopticon and moving-picture exhibits, which will be included in a train which is to tour the country and visit the various manufacturing towns for the purpose of giving the manufacturers the benefit of the best experience along the line of preventing accidents. Lectures will be given, and everything will be done to awaken and instruct the manufacturers.

At the states' session, the plan of promoting safety in Wisconsin, which has been adopted by the industrial commission, was outlined. This plan is a radical departure from the plans adopted by practically all of the states, and is made possible largely by the fact that a commission, with full power to establish standards, has been appointed. This commission from the first has taken the position that in order to accomplish what is possible to accomplish along the line of preventing accidents, the co-operation of manufacturers must be assured. The standards or orders which have been formulated and issued have been worked out by committees made up wholly of experienced manufacturers and factorymen. Exhibits, including some thousand photographs of the best safety devices which have been used in various industries, have been taken over the state and shown in all of the manufacturing towns. A monthly bulletin is issued which is a medium through which the commission is able to place before the manufacturers the best information in regard to the causes of accidents, new and efficient types of safeguards, and the most effective ways and means of organizing to promote safety in shops. William G. Bruce, secretary of the Merchants' and Manufacturers' Association of Milwaukee, declared at the congress:

"The manufacturers have been convinced that the commission is working along lines which

have been demonstrated by some of the large companies to be practical and efficient and, therefore, the co-operation of the manufacturers throughout the state is assured."

The next Safety Congress will be held in September, 1913. A council has been appointed with Fred. C. Schwedtmann of the National Association of Manufacturers as chairman, and L. R. Palmer, chairman of the 1912 congress, as vice-chairman. A committee of safety inspectors has been appointed to arrange for the features of the program which will be of special value to shop men and which will include informal ex-

perience meetings and visits to a number of industries where good safety work is being done.

This council and this committee will proceed at once to make a card index of all the safety men connected with the various industries over the country and endeavor to induce them to attend the next congress. A special effort will be made to reach the small manufacturers who have done little along safety lines and are unfamiliar with the best methods. The exhibit in 1913 will include a large number of machines in operation with various types of safety devices to cover the points of danger.

## EDUCATION AND WORK: A TWILIGHT ZONE

WINTHROP D. LANE

On the last day of last January John Pannello, aged fifteen years and five months, graduated from a public grammar school in New York. On the twentieth of February he got his "working papers" from the Board of Health. In school he had been fond of arithmetic and from childhood had wanted to become a bookkeeper. But the class room had become irksome to him, and his parents, financially comfortable, had just "taken it for granted" that he would go to work after graduation. He received no answer to his first application for a job—that of office boy in a place where he hoped that he might work up to a position as bookkeeper. So during the first three weeks after leaving school he spent his mornings looking for work and his afternoons gathering bits of wood with another boy and selling them around the neighborhood for kindling.

His efforts finally got him a job as errand boy for a dyeing and cleaning establishment. Five dollars a week were the wages, and tips amounted to a dollar or two extra. At the end of one week the boy who had had the job before came back and John was fired. He thought that if he could have stayed there five years he could have "got ahead."

After a day's hunt he saw a sign, "Boy Wanted," and was taken on by a firm manufacturing ladies' hats. Here he swept the floor, ran errands and helped to pack. At the end of two weeks, during which he had been paid \$4 a week, he left because "a feller who had been there four years was getting only \$6 a week."

Before leaving he had been lucky enough to get a promise of a job with a millinery firm. At first his work consisted in "going for stuff to the first floor," then he ran a crimping machine, and next was detailed to "get the cord downstairs for the men who make rugs." After a week and a half of this, during which his wage was \$4.50, "another feller said 'come along and learn car-

penry,'" so John got a job at loading and unloading wagons for a firm that made wooden boxes. He was soon allowed to sandpaper the sides of boxes with a machine, and then was put at cutting out sides for boxes with a circular saw. One afternoon he reversed the elevator suddenly and burned out the fuse; so he hurried home, afraid to meet the elevator man. When he learned next day that the boss was going to move to Staten Island he decided to quit, though he was getting \$5 a week. He had been with the firm two weeks.

During the next three weeks John did five different kinds of work for a manufacturer of jewelry and notions. He was making \$4.50, but when a man said, "come along, I've got an office job for you," he quit. The "office job" consisted in acting as shipping clerk, running errands, answering the telephone and sweeping the floor for a manufacturer of artificial flowers. He is still there, getting \$5 a week. He doesn't think much of the work. "What can I learn there?" he asks.

This story is true in all but the name of the boy. The situation of which it is typical, a situation in which masses of children find themselves today, has given momentum in several countries of Europe and America to a movement which has variously manifested itself in the employment agency, the vocational guide and the vocational educator. To focus their experience upon the problems which the situation involves, a hundred or more men and women came together in New York for four days at the close of last month in what was called the Second National Conference on Vocational Guidance. Nine meetings for discussion were held under the auspices of the Central Committee on Vocational Guidance, a New York organization.

### *Methods of Attack*

Throughout this conference two methods of attack upon the problem were uppermost in the

minds of the speakers. One was that of the "placement bureau"; of those people who, seeing untrained children enter occupations for which they are ill suited and from which they derive neither education, chance of advancement nor adequate income, believe that the most pressing duty in their behalf is to guide them individually into the most advantageous positions which can be found for them. The other method was that favored by those who said in effect: "Fundamentally it is wrong that any untrained child, without knowledge of industrial processes or skill in the use of tools, whose aims are vague and aptitudes unknown, should be allowed to work. It is an aggravation of this wrong to allow such a child to take a job which will not supplement previous education, or open the way to skill and independence. Yet children are going into just such work today. Therefore, we are but tolerating an intolerable situation when we accept school and industry on this basis and try to put each individual into the best job available for him. Our task is two-fold. We must reconstruct our system of education so that it will fit youth for the work which it will have to do; we must also study the processes and needs of industry so thoroughly that every child shall have the maximum of information on which to base his choice of work. Then, perhaps, we must go even farther and reorganize industry in such a way that it will hold positive cultural values for those who devote to it their full energies of mind and body."

Possibly the greatest service of the conference was that it brought into sharp conflict these two points of view. To the layman it appeared clear that the interchange of ideas had by the final session secured a wide agreement with the second viewpoint, without withdrawing acceptance from the first. It was still contended that thousands of boys and girls must not be allowed to pursue their hit-or-miss entrance into vocations and placement was pointed to as in itself one method of getting at the desired facts about industry.

### *Questions Raised*

When Cyrus C. Miller, president of the Borough of the Bronx, New York, and member of the Board of Estimate and Apportionment, declared that the city would be ready with funds the moment anyone brought forward a convincing program for vocational training in the schools, his challenge went unanswered. It was recognized that the movement is still in its infancy. Meanwhile some definite questions have been raised:

Shall industrial training aim to fit children for particular trades, or shall it educate them in elementary processes and underlying principles?

Shall it begin early in the child's school life,

or at the age of fourteen when so many now break away from the prescribed curriculum?

Shall it be grafted on the present elementary courses, or be taught in separate institutions?

Can industry be prevented from compelling the schools to give just enough training to meet industry's immediate needs, and no more?

Is it advisable to raise the compulsory school age two years, or with the curriculum in its present state, is this simply prescribing a larger dose of something already seen to be inadequate and unsuitable?

On the other hand, will raising the age limit, by throwing back upon the schools thousands of boys and girls who now go to work as soon as they can, force the schools to a quicker adjustment of education to needs?

Wherein is the problem of vocational training for boys different from that of vocational training for girls? In asking this question Kate E. Turner, assistant principal of Erasmus Hall High School for Girls in Brooklyn, declared that before girls are offered either guidance or training, society must make up its mind whether they shall be encouraged to look upon their vocations as permanent or only as temporary makeshifts until marriage. The modern trend toward co-operative housekeeping and economic independence for women, she suggested, is not sufficiently recognized by the schools; yet these things are constantly in the mind of the young girl.

### *Why Children Leave School*

Though these questions may not be answerable today, light has been thrown on not a few dark corners. For example, attempts have been made to learn why so many children leave school as soon as the law permits. A recent inquiry of the federal government conducted in six cities proceeded upon the basis that any family which had a *per capita* income of less than \$1.50 a week would need outside assistance to keep its children in school. It was found that in 25 per cent of the 524 families studied the income was below this amount, and it was therefore concluded that 25 per cent of the children in this group left school because of "economic pressure" within the home. Findings of the Vocational Guidance Survey of New York (now called the Vocational Education Survey and a part of the Public Education Association) which corroborated this study were made public for the first time at the conference.

Under the direction of Alice P. Barrows, a group of 302 children who had just applied for their employment certificates was intensively studied the past winter. With 20 per cent of these, economic pressure within the family was determined to be the dominant reason for leaving school. Yet this pressure did not always

amount to real need to the extent that the family would have required outside help if the child had remained in school. Sometimes a special necessity, such as sickness, death or unemployment had arisen to drive forth the younger members; sometimes the pressure was more anticipated or feared than real; and occasionally there was simply a strong ambition to "get ahead" which called into service the small earning capacity of those just passing fourteen.

The conclusion was therefore generally accepted at the conference that the necessity for increasing the family income is not the large factor which it has usually been supposed to be in causing the yearly exodus of children from the public schools. The real reasons are often bound up in the one word, adolescence. Miss Barrows concluded from the study made by her staff that besides the economic causes, other reasons grouped themselves under two heads, the parents' attitude and the children's attitude. Of sixty-nine boys who left one school 32 per cent were found to have dropped out either because their parents simply took it for granted that all fourteen-year-old children should leave, or thought such a course better in the cases of their children. Forty-three per cent left chiefly because they disliked school, were discouraged or retarded, or because they felt the natural impulse to activity which comes at some time to every healthy boy.

#### *What Kind of Training?*

To more than one speaker the fundamental question before the conference was what kind of vocational training shall be provided. To answer it requires the co-ordination of the knowledge of the psychologist, the expert in pedagogy and the industrial technician; for you must know what children can learn, what they need to learn and how it can be taught.

Yet the conference was not without its suggestion that prevocational instruction in the purposes and use of tools, training in manual dexterity and in whatever elementary processes may underlie modern trades must be made as vital a part of the school curriculum as reading, writing and arithmetic. These must be kept free from exploitation by industry, for their primary purpose is to educate and not merely to prepare plumbers, blacksmiths and machinists to follow a single calling. Indeed, it was declared that geography and history can be more effectually taught in conjunction with manual arts. A social policy in education must be worked out which will recognize that not a third nor a half, but, within a very small fraction, the whole of our youth go directly into occupations where neither geography nor spelling nor a knowledge of history aid them in acquiring proficiency.

#### *Where Attempted?*

Has such training as this been attempted? Some said no, because nowhere have the objective facts which must determine the form and scope of such a system been collected. Some pointed to Germany and her compulsory continuation schools, which enforce further education calculated to fit the child who is leaving school for industry. But it was objected that America cannot appropriate an exotic scheme suited to another nation's traits and customs, but must painstakingly work out her own. Frank V. Thompson, associate superintendent of public schools in Boston, said that Edinburgh, Scotland, had pointed the way and added that Boston is about ready to take over Edinburgh's plan. There, in accordance with an empowering act of Parliament, the school board and the board of trade have jointly created machinery to accomplish the following six objects:

1. To advise young persons as to the pursuits for which they are by ability, taste, character and education suited.
2. To induce the young worker to take advantage of all educational facilities pertinent to his work and to advise him as to the various steps in his industrial career.
3. To keep the system of further education in real touch with the industrial needs of the locality.
4. To advise young persons as to the opportunities which exist in the various occupations.
5. To collect and promulgate general information in regard to industrial conditions.
6. To bring together the employer with a specific position to offer and the young person suited to and desiring such a position.

The first four of these functions are performed by the educational authorities and the last two by the board of trade, or labor exchange officers.

While it was admitted that these efforts in England and Germany have emphasized the view that the giving of such training is a national responsibility and must be under the supervision of the state, it was pointed out that so far neither country has conspicuously gone back of the age at which the child leaves school. Neither, apparently, has proposed that the elementary schools themselves shall equip the child with a knowledge of himself and of industry sufficient to enable him to choose wisely and begin auspiciously an occupation containing promise of further development and advance.

The real solution of this problem for America, said some, is being worked out in Gary, Ind. The details of the plan by which William A. Wirt, superintendent of schools, is there keeping children in the class room for more years than other cities find it possible to keep them, and the system of trade training by which he is seeking to

turn out youths equipped to enter industry advantageously, were not given from the platform; and the story is too long to find a place in this report. Let it be pointed out, however, that most of those at the conference felt the need of more systematic knowledge both of the requirements of industry and of its teachable elements before a definite program can be agreed upon.

Amid doubt as to what kind of training shall eventually be found suitable, there was no hesitation in characterizing the usual trade training of the present day as either inadequate or of an improper sort. The "manual training" given in many high schools came in response to the demand which this conference voiced, but it was declared that it begins too late in the curriculum and touches only a small part of children who enter industry. Technical schools, on the other hand, are too advanced. The "trade schools" now found in larger cities usually do not admit persons below sixteen and too often aim to prepare for particular vocations.

#### *Raised Standards in Industry*

But if there is need of a changed front in education there is need also of raised standards in industry. We must determine what sorts of work shall be allowed to go on in the world—this was the challenge put to all who create wealth. If a vocation be found which dwarfs bodies, stunts mentality or in other ways prevents that self-expansion which is the right of every worker, then that vocation must alter its methods or cease to exist. Edward L. Stevens, associate city superintendent, New York, formulated seven questions which he would ask of every occupation into which children are sent: Is it healthful? Is it enduring, that is, not likely to be replaced

as soon as proficiency has been gained? Is it non-seasonal? Is it moral? Does it present likelihood of promotion? Is it educative? Does it pay a living wage?

It is for two purposes, then, that we must study industry. First, to determine what standards industry may be compelled to live up to; second, to discover what must be the industrial content of the new education, how much and what kind of technique must be taught.

#### *Individual Aptitudes*

But suppose you have re-made educational systems and reformed industry to your liking, what will it profit you if you can not discover the individual aptitudes of children? At this point the vocational analyst enters. How he will work, and to what extent he will be able to guide children into callings for which they have natural talent, are still, it was felt, questions not fully answered. Success may lie in the direction of self-analysis; that is, teachers and advisers may be able to induce young people so to look in upon themselves that they will come to a satisfactory gauge of their own talents and limitations. Henrietta Rodman, of Wadleigh High School, New York, told of her success in employing this method. Another hint of possibilities ahead was contained in Prof. James E. Lough's account of experiments made at New York University, where Mr. Lough is professor of psychology. Students were asked to go through simple operations to ascertain what degrees of the habit forming power they possess. This was regarded as determining to a large extent their likelihood of success in typewriting, stenography, telegraphy and other occupations demanding a large capacity to make slight movements rapidly.

### FUNCTION OF VOCATION BUREAUS

Among a dozen practical booklets on the subject of vocational education, published by the students and committee of the High School Teachers' Association of New York City, is *Wage Earning Occupations for Boys and Girls* by E. W. Weaver, chairman. In Mr. Weaver's opinion the function of such bureaus should be:

- 1, To study the needs of groups of employers, one or more at a time, and to encourage these employers to formulate definite standards of requirements.

- 2, To make available to schools and their students information in regard to the standards of requirements as they are formulated by successive groups of employers.

- 3, To assist schools in organizing special classes in which workers, or prospective workers, could make specific preparation in the shortest possible time for given lines of work. Such special courses of study to be given in continuation classes or in the final years of the regular school work.

- 4, To disseminate information in regard to the vocational training resources of the community; to maintain a bureau of information and advice; and to encourage the extension and the addition of facilities for practical instruction along lines in which the facilities of the community are inadequate.

- 5, To set on foot measures for placing employers, in touch with the responsible representatives of those schools whose students are most likely to be best qualified for their service, so that the information which the schools have of the qualification of students may be made available to employers who are seeking recruits for their service.

- 6, To maintain a registry of students of a high degree of promise; to find for them suitable employment, advise them in regard to subsequent educational courses, shift them about from one form of specialized employment to others along the same line of service, to the end that they may secure a larger and wider experience than that which it is generally possible for them to get in the specialized work of the shops and the offices.

GRINDING COLORS IN A PAINT FACTORY

## THE LEAD WORKERS

SOME SAMPLE  
LEAVES FROM THE  
LIFE HISTORIES  
OF NINETY-SEVEN  
WORKMEN.

There is a factory in New York where molten lead is used in considerable quantities as a tempering agent. Nine men are regularly employed there. It has been in operation one year and in that time nine men have had lead poisoning. When inquiry was made about these cases the paymaster asked in surprise:

"Why! Is lead dangerous?"

Edward E. Pratt and his assistants who made the study of occupational diseases for the New York Factory Investigating Commission are under the impression that it is. For they found 376 cases in New York occurring within three years, and this, Mr. Pratt estimates, could not have been over half of the number that actually did occur.

One of the most striking facts to be gleaned from the report is the ignorance and indifference which were manifested by foremen and company officials, as well as workmen, with regard to the dangers incident to the handling of the various forms of lead and the precautions which should be taken.

"There are all grades of indifference," says the report, "from the employer who told the commission with gusto and pride that he had provided buckets which the men could fill with cold water in which to wash, but which the men said they actually furnished themselves, to the employer who really has taken considerable precaution but who does not enforce the measures which he knows are best."

In a thorough examination of 109 cases it was found that sixty-two ate their lunches in the workroom, twenty-two reported that they had

not been in the habit of washing before eating their lunches, and forty-five who did wash used only cold water. The investigations showed that in many cases only cold water was provided and in some cases none at all. Only seventeen of the 109 reported that they had been given any instruction regarding the hazard of the occupation, or with regard to hygienic measures; seventy-three reported definitely that no instruction whatever was given; ten reported that instructions were posted in the work place, and seventy-six reported a total lack of even the posting of instructions.

A long list of recommendations is offered. These include the licensing of the industries, the physical examination of employes each month, close supervision by the medical inspector of factories so that a man once having contracted lead poisoning may not again be employed in an industry in which lead is used without "the specific and written consent of the medical inspector of factories." Suggestions are further made with regard to ventilation and the providing of an abundant supply of hot and cold water for bathing.

The investigators got fairly complete occupational histories from ninety-seven men and these are published in the report. The following are typical cases selected from this list. "It has not been our aim in presenting these cases," says Mr. Pratt, "to draw forth all the harrowing and pathetic details. . . . We have sought rather to present in story form the plain, bare facts and to allow the reader to draw for himself the conclusions which inevitably follow."

CASE No. 85—PAUL T—:

**I**S a native of Wurtemberg, Germany, and has been a painter since he was ten years of age. He, like many another young German, has had the "wanderlust," and has wandered in Germany, Switzerland, France and Africa (Tunis). In the latter place he met his wife, and they were married in 1892. One year later he came to the United States (1893).

He had his first attack of lead poisoning in Paris, where he was doing some fine interior decorating, which he described as Louis XIV style. He had been working long hours, from 6 a. m. to 11 p. m. It was after this time that he went to Tunis, and later to Paris, and finding no work there came to the United States. He immediately found work in a large apartment house that gave him employment until the following spring. He then got employment as a house painter and decorator at the Hotel V—, where he remained twelve and one-half years. Here he did painting and decorating work of the finer sort and had charge of a large gang of men who were under his direction. When the hotel went out of business, he did several jobs for small houses in Jersey. His first attack in this country came when he was working at the Hotel P—. A strike had delayed the work and when the men came back they were pushed to the limit. While working on the decorations in one of the large banquet halls he was stricken with lead colic and was disabled for four weeks. His work from that time forth became rather irregular, although he worked for one or two firms. Most of his work was of a fine grade and he did considerable work in private houses where it was necessary to use white lead, to sandpaper and to stipple the work. Last March he got a job at the new F— Theatre, where he was employed on the interior decorations. He held this for a couple of months, and then got a job doing some exterior painting. After a short illness, he found work at the G— Club House. Here he was engaged on the big banquet hall and was working steadily and very hard. The work was of the very finest quality, and he had just about completed it and was ready to varnish when he "keeled over." He says he does not know how he got home, the attack was so sudden and so complete. Since that time (July 1) he has been out of work, almost wholly incapacitated. His left hand is almost wholly useless (he uses both hands in painting and is left handed), and his right is partially affected. His knees and ankles are also swollen and give him considerable pain. He says that after he had his last attack his whole body seemed to be stuck with pins and needles. He has always been scrupulously clean and has worked carefully and taken good care of himself.

CASE No. 51—CHARLES G—:

**A** YOUNG Scotchman, 31 years of age, gave up the sea some eight years ago and settled down to life as a caster in a tinfoil factory. Here his job consisted of melting up lead pigs together with tin and some other ingredients which make up tinfoil; then ran the molten composition into a mould, forming a slab of the metal about two feet square and one inch in thickness. This slab was then taken to the rollers where it was rolled thinner and thinner as desired. After working here for eight years he was taken with a sort of paralysis of the hand, the fingers—especially of the right hand—closed tightly and he found it impossible to open them without assistance. When seen at the hospital he had been there only a week, but showed decided improvement.

At the time of the attack he was earning \$15.00 per week. He described the room where he worked as well ventilated by two large exhaust fans and as clean and well lighted. He was instructed as to the dangers of the work, and was told to wash thoroughly and to rinse out his mouth before eating. It is also evident that the man took precautions. It is evident, therefore, how very careful employers and employees must be to avoid lead poisoning.

CASE No. 8—SAMUEL B—:

**T**HE neighborhood, about two of the plants which are located near together, is filled with lead poisoning cases. One can hardly walk without stumbling into them. A map dotted with a red pin for every case would look like the tuberculosis map of the New York "Lung Block." Thus the three cases just recounted were all found at the same address, and in the same apartment.

While searching another house, only a block away from the place where the last three cases were found, for a man whose record we had, but who seemed to have moved and left no trace, the present case was located. Samuel B— is a huge, pallid-faced youth, with only a few words of English at his command. His wife, smaller, bright-eyed and vivacious, acted as interpreter, and when she had done this service, piloted the investigator two doors further up the street, to the home of a fellow workman of her husband's, who had been down with the colic just the week previous.

In July, 1907, B— came to America, and at once went into the employ of the white lead company, where he became a stripper. A stripper's duties are to stack the lead buckles in jars over weak acetic acid, and stack these jars in tiers in long rooms, the floors of which are spread with tan-bark.

#### CASE No. 5—PETER P—:

THREE months, August, September and October, 1910, were enough to give Peter P—, a "mixer" for a white lead company, a dose of lead poisoning severe enough to make him leave the industry. He is now picking up a precarious living as a longshoreman on the Brooklyn docks. His total weekly income averages about \$7.50, but his health is safe, and at any rate he received only \$8.85 from the lead company.

Coming fresh from the farms of his native Lithuania, P— landed here in 1909. He is a well-built, bright-eyed, intelligent man. Only the bar of language prevents his making his mark in America. For a few months after landing he worked as a longshoreman. Next he was on the payroll of a large sugar company.

P—'s third American job was a bad one. From some time in August, 1910, to the end of October, he stood for ten hours a day, nine hours on Saturday, over a great iron mixing bowl, in which oil and white lead were being kneaded to make the white lead to be used for ship-building and painting. The workers have to pour in the in-

gredients, supervise the mixing process, and take out the finished product. Before the three months were up, P— was incapacitated. Severe cramps and colic and a slight headache fastened on him and kept him from work. This and the consequent weakness lasted two full months, at the end of which time, being again able to work, he became a farm hand on the outskirts of Brooklyn. Here, in a little place on R— Street, he did chores and tended live-stock from December, 1910, until the following May, for \$18 per month and his keep. In May he returned to the docks, where he now is, as described above.

The effect of the lead poisoning, which was so diagnosed by the company's doctor, seems now to be gone, except that P— complains that he is not as strong as before the attack. He looks, however, perfectly well.

P— says no instructions for care or cleanliness were ever given him in the lead shop, and that he never saw any instructions posted. The company provided a hot and cold water supply, and a doctor, but took no other precautions for their men.

#### THE LEAD WORKERS

(See page 229)

When the corrosion has suitably advanced, after one hundred days or so, the stripper takes down the stacks and empties out the white lead which has formed in crumbly cakes and powder. B—'s pay for this work was \$9.60 per week, for fifty-nine hours. He was given only the inadequate time of half an hour for dinner. He lost no time through slack work, but every year was incapacitated from one to two weeks.

The nature of the incapacity was the usual one with lead workers; severe cramps, colic, constipation, vomiting and loss of appetite. B— has been in this place now for four years, and has had four separate attacks, all with the identical symptoms. These attacks came from eight to sixteen months apart, and lasted each from five to fourteen days.

"No!" was the answer of both B— and his wife when asked about warnings or signs in the factory. He does not eat there, coming home to dinner. At meals he drinks two glasses of beer per day; he chews almost continuously, and every day smokes from five to ten cigarettes. Two cups of coffee make up his breakfast. He "sometimes" washes before eating, in cold water, and does not change his clothes either in the factory or at home. He is clean-shaven.

#### CASE No. 81—FRANK B—:

A VERY peculiar case is that of Frank B—, a young painter living on the lower East side. Apart from one severe attack of lead colic in 1903, he has had no apparent disturbances. But for the past ten years, beginning six years after he took up the trade in his boyhood, all the finger nails of both hands have been in a pitiful condition. They are blackened, corroded, and in many cases eaten away half way to the quick. He has several times had them treated, but their condition remains unimproved. One physician told him plainly they would never improve until he stopped painting. "What shall I do?" he said, "painting is all the trade I know." In addition to the corroded nails, his fingers frequently have spells of numbness or paralysis, during which it is impossible for him to hold or wield a brush.

He got the union scale of wages (\$22) for forty-four hours' work. The time lost by B—, due to his plumbism, is slight, being only a day or a half day at long intervals, but he reports from eight to twelve weeks lost yearly, due to slack time. "They rush us to death on the job," he declared, "and then worry us to death by making us hunt for a new one."

B— is unmarried. He was born in Roumania in 1879, coming to this country before his tenth year. No instructions were ever given him as to the insidious and far-reaching poison he was working with, or how to guard against it, nor were any such instructions posted in any place he worked.

SHOVELING WHITE LEAD INTO SEPARATOR—A VERY HAZARDOUS JOB

*(The Lead Workers, continued)*

**CASE No. 45 - SADIE G—:**

**S**ADIE is an intelligent, neat, clean girl, who has worked from the time she got her working papers in embroidery factories. In her work she was accustomed to use a white powder (chalk or talcum was usual) which was brushed over the perforated designs and thus transferred to the cloth. The design was easily brushed off when made of chalk or of talcum, if the embroiderers were not careful. Her last employer therefore commenced using white lead powder, mixed with rosin, which cheapened the work as the powder could not be rubbed off and necessitate restamping.

None of the girls knew of the change in powder, nor of the danger in its use. The workroom was crowded and hot, the stampers' tables were farthest from the windows and the constant use of the powder caused them to breathe it continually and their hands were always covered with it.

Sadie had been a very strong, healthy girl, good appetite and color; she began to be unable to eat, had terrible colic, but con-

tinued to go to work in spite of the fact that she felt miserable. Her hands and feet swelled, she lost the use of one hand, her teeth and gums were blue. When she finally had to stop work, after being treated for months, for stomach trouble, her physician advised her to go to a hospital. There the examination revealed the fact that she had lead poisoning—which was unaccountable as no one knew that her work had involved the use of lead until some one who had been on the job also recalled hearing the manager send a messenger out with money several times to buy a white lead powder.

Sadie was sick in the hospital for six months—(losing \$10 per week). She said her employer bought off several of her witnesses, but before the case came to trial two years later several of them also became ill and consequently decided to testify for her. The employer appealed to the girl's feelings and induced her, on the day of the trial, to accept \$150. He said that he had had business reverses and consequently would be unable to pay in case she won. Her lawyer was suing for \$10,000.

## DANGEROUS TO BE CARELESS; PERILOUS NOT TO BE

Carelessness in factories is not guilty of all the things with which it is charged. If a man is too careful he is bound to get hurt because of his awkwardness. He must avoid that danger by learning the motions so well that they become automatic and he does not have to think about them. Then he is likely to get hurt whenever the machine balks. This leaves him in something of a dilemma, but it appears to be the truth, for it is a conclusion reached by the Federal Bureau of Labor after a careful study of accidents in the metal trades.<sup>1</sup>

Out of 517 accidents studied, 234 were charged to carelessness on the factory records. The report disputes this classification in the case of two groups of workers—those who were careful and those who were care-free.

The first group was the larger and consisted of workers who had been in the shops less than a week. Of these the report says:

"The faltering learner is in constant danger. Not only are his movements apt to be awkward and imperfectly co-ordinated, but the very intensity of his care is in itself a source of danger; strained attention leads to action by anticipation. . . . Mangled fingers, a lost hand, or greater mutilation may result.

"This would certainly be attributed to carelessness by any foreman in any factory. But is it so? . . . A normally organized nervous system has simply done what it must under the circumstances, and disaster results. . . ."

Naturally the more nervously constructed the worker, the greater the danger. Hence the new women workers form the larger proportion in this group.

The other disputed group of accidents can be classed roughly as due to "taking risks." The analysis of underlying causes in this group is extremely important.

"As practice continues," says the report, "the tension gradually subsides and the worker attends less closely, but is vastly more safe. The operator may look at other things, may speak with a companion, or do things which indicate that attention is no longer concentrated to so painful a degree upon the work. At the same time the rhythmic movement of the hands keeps on and the output of the machine continues. This condition is often described as one of carelessness. The term is exceedingly misleading in this connection, since it implies that the worker is taking a risk in a blameworthy fashion. In becoming thus, in a measure, detached from the machine, the worker does the only thing which can relieve the relatively great danger which assails the beginner.

"In his case danger intrudes at two points, at neither of which can he be said to sustain a responsible position toward the result. A very large number of mechanical processes involve a

series of operations. . . . For example, in the operation of the stamping press, the adjustment by the fingers of the object to be formed is followed by a movement of the foot releasing the treadle. Gradually the two motions assume a direct relation of cause and effect, with no intervening volition. . . . Suppose the worker has reached this stage of his development. Some roughness in the work, some failure of the machine to do its work exactly may delay or disturb the first motion . . . and the execution of the second may, probably will, give rise to danger. . . . But once started the successive motions are beyond the worker's control.

"Another disturbance of the usual cause of events may occur through the special senses. . . . After the series of motions starts, the worker sees something wrong with the machine. This may, usually will, start an entirely new series of actions, but does not stop the one already started. Here again comes in the inevitable movement of a nervous machine. In an entirely involuntary way he reaches to adjust the disordered machine. . . . He will press the treadle and at the same time put his hand under the die."

From accidents due to these causes, women are the most frequent sufferers. - The reason being that they generally work on the lighter and therefore swifter machines.

If then, the care-free automatic manner of working is best for both worker and product, the manufacturer for his own and the workers' protection should provide such safeguards that the operatives working automatically will be automatically protected to so complete an extent that accidents are impossible. In a few of the metal works visited an approach to this condition of automatic safety was found.

## JOTTINGS

### HAT MAKING BEFORE AND AFTER

Among the most effective unions of women workers in the United States is the Hat Trimmers' Union which is at its strongest in Newark. *Life and Labor* sets forth in "before and after" columns what organization has done for the hat trimmers:

#### BEFORE ORGANIZATION

Low wages.  
No limits to working hours.  
Home work.  
Discharge in dull season.  
No protection from insult.  
No pay for extra work.  
Worker had to provide silk.  
Worker had to furnish cotton and needles.  
Favorites received easy work.  
No heed given to workers' grievances.  
Doors locked; no fire protection.

#### AFTER ORGANIZATION

50 per cent increase of wages.  
52 hours a week.  
No home work.  
No discharge; fair distribution of work.  
Worker respected.  
Extra pay for extra work.  
Employer provides silk.  
Employer provides cotton and needles.  
No favorites; fair division of easy and hard work.  
Conferences held and grievances adjusted.  
Open doors; fire protection.

## HOME MISSION WEEK: ITS PLEA FOR THE PUBLIC FUNCTION OF CHURCH WORK

GRAHAM TAYLOR

There are cheering signs all along the horizon that both the churches and the body politic are recognizing the public function of religion, and are depending, as never before, upon its fulfilment for the support and progress of state and church. This indicates no reversion to any organic union between church and state. More and more in other lands, as always in America, the state-church and the church-state are realized to be disadvantageous alike to civil and ecclesiastical interests.

But signs multiply that the churches are re-awakening to their quasi-public functions and their semi-official status, and that the body politic is increasingly aware of its dependence upon the religion of the churches for its stability and progress. No more emphatic recognition of this fact has ever been given by the churches than by the preparations made for the observance of Home Mission Week, November 17-24, by the federated protestant churches. When the representatives of their 22,000,000 members, 60,000,000 adherents, 215,000 organizations, 162,000 ministers, and \$1,300,000,000 worth of church property put forth their appeal calling upon church members and citizens alike to support the work of the churches for the home land what facts and fig-

ures, what motives and persuasion did they use? Outsiders who have not kept up with the times, as well as some belated insiders, might expect the appeal to have been made to denominational sectarian zeal, to ecclesiastical pride, and to the worthier, but narrowly individualistic, concern for the loss of souls. This probably would have been the burden of the appeal if it had been made by denominational mission boards two or more decades ago, before it was possible for them to federate in their "home missions council" and to issue this present joint appeal. But now it is evident that the church and the community are too conscious of each other's existence and of the community of interests between them to allow any such appeal to misrepresent them.

This deepening and broadening social consciousness characterizing the dawn of the twentieth century finds expression, as profoundly significant as it is prophetic, in the "twelve poster pointers," some of which are here reproduced. Only two deal with ecclesiastical statistics. The eight shown are devoted to conditions in the body politic which concern civic patriotism as deeply as they involve loyalty to religious ideals and motives. Four touch on population problems, dealing with its movement from country to city and from shore to shore, and with the relative growth of the Negro race; one deals with the expansion of territory, one with illiteracy in

Cuba, and another with the economic aspects of the liquor problem, relating the total of wages paid and the cost of raw material to the proportion spent for bread and clothing and for intoxicating liquor. Two visualize significantly the percentages of women and children employed in each occupational group, together with the ownership of wealth and the growth of Socialism. These charts show the trend of American social and religious conditions. "What are you doing to meet the situation?" is the question asked of the churches by the Home Mission Council.

Surely this type of church appeal heralds the dawn of a new day, but it is the dawning again of the old Sun of Righteousness, with healing in his wings. It is no less the light of understanding arising within the common mind—understanding of the complex relations of man to man in modern society. It is the movement of the common heart to realize the undying hope of social justice and human brotherhood. It is the movement of the common will to find and apply some adjustment of the disturbed relationship and dislodged classes, caused by the most revolutionary force ever introduced into human affairs, except the gospel, namely, the modern industrial system.

It cannot be denied and should not be forgotten, however, that America owes the rise and spread of much of this light which now illumines the common day to the churches and synagogues of religion. Their pilgrim fathers and pioneer priests, circuit riders and frontier missionaries, their Sunday schools at the cross roads, home mission churches and synagogues, with their little congregations and reserve funds, have led the way in which town government, county institutions, state legislatures have followed and found support. There have been no more germinant units of civic politics than these pioneer home mission churches around which the New England town meeting arose and our western towns have grown up. Their preachers and pastors have been the pioneers, their Sunday schools have been the couriers, their superintendents, and college presidents have been the statesmen on the advance line of our civilization. First among the social agencies for raising the abject, restoring the subject and assimilating the alien elements of our American cosmopolitan population are the missionary schools, institutions and personal ministries of the churches among the neediest Negro, Indian and immigrant peoples.<sup>1</sup>

Across the frontiers in the rear, as well as in the vanguards of our civic and social progress, those who constitute the rank and file doing the remedial, constructive work in philanthropy and for social justice as well as those who lead them, are largely recruited from among those who are either members of the church and synagogue, or

have been inspired and partly trained by them for such service. One of the diagrams brings out the fact that of a thousand social workers recently tabulated 92 per cent of those connected with associated charities, 88 per cent of those connected with social settlements and 71 per cent of all others are church members. This should mark the beginning of the end of that distrustful spirit and non-co-operative attitude between church and community which has been so disastrous to both. It should assure the community that it pays to support the churches—that it pays to support them more largely than they have been supported. The church also should be encouraged to go on "watering the roots," putting the under-pinning out of sight, underneath everything, recruiting more kinds of ministry, even at the expense of having fewer ministers of one kind, and building better than she knows. Certainly her experience in so doing in foreign lands proves how well warranted is her adventure of faith in casting her bread upon the waters. For after many days it is returning not only in the new Japan, the new China, the awaking India, the emerging Africa and in the freedom of the Balkan peoples and the restriction and reconstruction of the Turkish Empire, but after many days the churches will yet regain at least their co-operative unity as a return for their world work in foreign missions.

While it is to the credit of the churches that they have put their social ideals and efforts into life rather than into literature, however imperfectly, unevenly and slowly they may have done so, yet the social literature of the church grows apace both in value and in volume. The official reports and papers presented by foreign, home and city missionary executives and agencies are becoming more statesmanlike. This is more indicative of progress even than the rapidly increasing monographs written by church scholars in the fields of social research and constructive effort. It is equally significant also that each new constructive effort puts forth literature of its own, or republishes other social literature for its own use. The seven volumes of *Men and Religion* Messages contribute to social literature the notable congress addresses and the still more original reports of commissions on Social Service, Boys' Work, The Rural Church, The Church and the Press, together with new emphasis upon the social significance of Bible study, evangelism, missions and Christian unity.<sup>1</sup> The set of eleven volumes previously published by the press of the Young Men's Christian Association, under the title of the *Men and Religion Library*, significantly includes such monographs as Devine's *Misery and Its Causes* and Rauschenbusch's *Christianity and the Social Crisis*. The religious press is also being permeated by the

<sup>1</sup>H. Paul Douglass, *Christian Reconstruction in the South*. Pilgrim Press.

<sup>1</sup>Messages of the Men and Religion Movement, Association Press, 124 East 28th Street, New York.

social spirit which radiates from a few papers edited with keen social intelligence, insight and outlook.

No "leading question" has ever been more incisively put both to the church and the community, predicating the identity of their interests,

than Mr. McAfee raises in these columns: Who Owns the Church? From whatever point of view answers may be given, they one and all must admit the claim which the community has on the church to be at least equal to the claim which the church has on the community.

## WHO OWNS THE CHURCH?

JOSEPH ERNEST McAFEE

Church property in the United States aggregates at least a billion and a half dollars. This makes no reckoning of the immense values invested in adjunct institutions which the churches directly or indirectly control, such as schools, hospitals, orphanages and the like. The operation of church plants proper requires an annual expenditure of \$250,000,000.

Who puts up all this money? Who owns this vast investment?

The answer is immediate and simple for one who understands and accepts American principles. There are 35,000,000 members in the American churches. The proprietorship resides in these thirty-five millions. The policies of the various denominations differ widely. In some the rank and file of the membership have little or no voice in the details of administration. Those who administer are "representatives" of the people, often perhaps very remote in their representation, but it is unthinkable that an American institution should be administered by agents or agencies not even remotely responsible to the people whom they represent. Whatever may be the traditional theories of church polity, Americans do not deliberately accept a system which puts them and their property at the uncontrolled disposition of a hierarchy.

And fundamental American principles carry us a step further. The church is a public institution. It is supported by the public, is designed to serve the public, and belongs finally to the public. Not even these 35,000,000 members are the absolute owners of the accumulated church property. The American church is not, of course, a state institution. Americans are tenacious of this distinction. But the church is in most commonwealths specially protected and encouraged by the state and is often granted favors which no other institutions enjoy under the law. In many regions its property is exempt from taxation. Certain kinds of business, otherwise recognized by the law, which tend to interfere with the effective conduct of the church's work, are prohibited from encroachment upon zones occupied by churches. Other semi-public institutions grant the churches valuable favors. Ministers are generally carried at half fare on the railroads. In large sections of the country the railroads furnish certain leaders of the church annual passes, and thus carry them free,

of course, at the expense of the traveling public.

Thus by final reckoning the church is a public institution; it belongs to the community. The actual cash required for its maintenance is often supplied by the community at large. Comparatively few church buildings have been erected by the contributions alone of the actual members of a particular society. Even the money immediately required for the annual operating expenses often comes from the community. Almost every church receives regular and substantial subscriptions from persons not enrolled as members. In some cases this source of revenue supplies the major part of the support. The merchants and influential residents of the town, regardless of their immediate church membership, are canvassed regularly in some communities. The churches are treated as public institutions, at least for advertising purposes. The next time you ride through any of the boom-sections of the country, where the attractions of the towns are set forth on flaming boards at the railroad stations, observe the uniformity with which the three, six or twenty churches are mentioned near the head of the list, by way of attracting new residents to the community.

Who then has the final right to control the immense investment of money involved? Not the thirty-five million members. The American churches belong to the whole American people.

To this extent they are on a footing with the railroads. It is remembered that, a few years ago, a prominent railroad president made certain dogmatic declarations about the absolute rights vested in those whom an inscrutable providence had placed in charge of the railroads of the country; it is also remembered what a storm of protest went up from the whole American people, and how vehemently his claims were repudiated. Not even the stock-holders absolutely own the railroads. Their officers and directors have not the right to run them as they may choose. The railroads belong finally to the whole people, the whole people support them, and more and more stringent laws are enacted to compel them to serve all the people impartially.

The same principles are applicable to the churches. In the case of all such public and semi-public institutions the stake of the whole people is now generally recognized. No citizen can walk the street before a church and say, "You are no concern of mine"; nor can any

church frown down upon the humblest passer and say, "Go your way, I am none of yours."

### *The Exercise of Proprietorship*

Yet no branch of the American church operates under a method by which those who own the church control its policies and activities. Perhaps there are some who believe that the church is all the better off because this is true, but their conviction is beside the point; the fact remains, whether the result is good or bad. It may be insisted that the activities of some branches of the church do accurately express the popular will, but if that is true it is much of an accident, for in none is the machinery of administration scientifically adjusted to guarantee that issue. When King Edward VII died, an eminent British royalist declared in a memorial address that if England were a republic their popular king would undoubtedly have been elected president. The notion may have convinced the royalist of the virtues of the monarchical system, but probably is not convincing to the thoughtful republican.

Furthermore, there is much evidence that those who own the American churches do not discover in the churches' activities the expression of their will. This is perhaps not revealed so clearly by criticism of the church as by indifference to it. The criticism may seem to leave nothing to be desired in the way of criticism, either as regards volume or animus. But violent as such criticism has often become, an unconcerned or flippant indifference is far more conclusive evidence that the people do not take their ownership seriously. The vast majority of even nominal members are abysmally ignorant of what is going on in their own branch of the church, not to speak of the other branches. Hundreds of thousands, perhaps millions of church members themselves do not from year-end to year-end cast a vote or in any conscious manner exercise their franchise for or against any policy of the church. Certainly multitudes of those not even nominal members go from year-end to year-end unconscious of the church's existence, except as it is accidentally called to their attention.

The growing volume of criticism may well be taken as an evidence of renewed vitality in the public's consciousness of the church. The people are at least taking notice. In a democracy sluggish indifference is perhaps more to be feared than riot. But once the public consciousness is stirred, the public will insist upon finding expression in the public institutions. What will happen when the people, both in and out, who own the churches, awaken to full consciousness of their proprietorship? There is much politics in the churches already. There is much discussion of who shall have this office and who shall

have the other, much debate as to whether theological conservatism or radicalism shall control the standards of thought; there is much heated argument as to radical or conservative measures of administration. But relatively a very small group of disputants generate all the heat, and even the most vital issues are as if they did not exist in the thought of the large majority of the people.

### *When the Owners Take Hold*

In civic affairs Americans insist upon voting directly for their presidents. They have to all practical intents discarded the electoral college which the framers of the constitution with determined zeal thrust between them and their franchise. But no private member of a principal branch of the American churches voted directly for the officer or officers who control the policies or in any large way execute them in his church. The direct election of Senators is certain to win out,—has already won out, though apparently insuperable constitutional barriers intervene. But who ever heard of direct elections by the people in the churches? Even the petty offices of the local congregation usually get filled by a process incomprehensible to the average church member. What a far cry it would be for the people of the churches to claim an ecclesiastical initiative and referendum and recall! And yet a great mass of the American people are clamoring for these prerogatives of democracy in civil affairs with a seriousness and determination which is bound to win still further victories for such policies, whatever may be the final verdict as to their value. The contest is at least evidence of the seriousness with which the people take their civil democracy.

It becomes an interesting question how long the very same people who are seriously bent upon these prerogatives in civil affairs will remain oblivious to the manner in which they are shut out from exercising them, or anything like them, in the church. One wonders how long the thoughtful American will contentedly carry his religion and his politics in sealed compartments. Ecclesiastical and civil ideas can surely not long surge through the same brain without at least a slight admixture. And when the admixture takes place some interesting things will happen. This article is not intended to add a single rivulet to the torrent of criticism pouring out upon the church nowadays. It aims merely to point out facts. But it certainly will be fun to live through the next decade—or two or three—and to observe and have part in what will happen when the American people come to comprehend who owns the church and who has a right to control it.

Such an analysis as this may seem cold and impassive. What is the church, anyway? A pile of brick and mortar, which can be assessed at

so many dollars? Who cares that the real estate upon which church buildings are erected is estimated at a billion and a half of dollars? Land and buildings are not the church, and the church is not they; the church cannot be bought and sold! All of which may in certain connections be worth declaiming, to be sure, just as it has sometimes been found important to declare that the brain is not the mind. But, all the same, no one can quite comprehend how the mind can function apart from the brain. It may be desirable frequently to magnify the "church invisible," but to become a vital force in human society the church commonly finds it convenient if not necessary to assume an intensely visible and tangible form. And though this "form," in the subtle analysis of some, may not be veritably "the church," yet the most of the people are so severely pragmatic as to associate the "form" indissolubly with the substance. In any event the question is not less interesting, Who owns the churches, and, upon claiming proprietorship, what will the owners do with them?

#### FRESH FROM THE FIELD

From the correspondence which immediately sprang up in response to the announcement of this department last month new sources of information and suggestion are opening to us which we hope to share with our readers. One way to do this will be to quote excerpts which show the way the winds of the spirit are blowing. From old Mexico a business man pauses to write:

"Something must be done for the betterment of the poor and ignorant masses here. There is a special need for work in public playgrounds and recreation. It will have the support of good citizens here. A street boys' home was started, with beds for 200 boys and provision for meals. Teachers from public schools give free instruction at night. It is a good sign that Mexicans as much as foreigners are interested in this work. In the turmoil of change that is going on politically, I hope to see a better social order worked out."

An Ohio correspondent suggests an inquiry into the work being done to train boys and girls in the principle and practice of social service, particularly by the Sunday schools. We shall be glad to have other correspondents answer this inquiry by citing practical endeavors being made to this end.

A New York correspondent informs us of the organization of the Laity League for Social Service by the New York Federation of Churches. One of its first interests is to find effective methods of dealing with the social evil in New York. Another reports the very significant utterances at a social welfare conference which crowded the Cathedral of St. John the Divine to its utmost capacity. Mayor Sague of Poughkeepsie made a deep impression by his terse description of "the church coming to her-

self, the spirit of Christ acting through the church in social service." He wanted such an answer as the early Christians might have given to his question "what the cathedral means to the toilers of the city, the tired, underpaid women, to all those of the numerous throng who find life hard and dull, to the idle, the vicious, to those who prey upon their fellows?" On the same occasion Winston Churchill broke away from his campaign for the governorship of New Hampshire to speak of the modern spirit of the churches as a closer relationship to every-day life. Bishop McCormick of western Michigan thought that the complexity and confusion which the church meets in dealing with labor is no greater than labor meets in dealing with the churches. The unionizing of labor is a plea for church unity. Only "christianized labor and democratized Christianity can win the world for justice, righteousness and peace."

#### JOTTINGS

##### ROMAN CATHOLIC SOCIAL ADVANCES

Roman Catholic churches and societies in Chicago are advancing their social work vigorously. Perhaps the most significant movement is the devotion of a parochial school building to the social work of a neighborhood center. St. Malachy's church has taken the lead and set a high standard in dedicating its new school to this purpose. This action is the more noteworthy because the opening of public school buildings as social centers has not been favored in some church quarters.

The fifteen Catholic charitable organizations recently established the Catholic Federation of Charities of Chicago, which is expected to include as many as 200 Catholic institutions and societies. At the call of Cardinal Farley a similar step was taken in New York, where the central organization is to be known as the United Catholic Works.

The Polish Roman Catholic Union of America, numbering 60,000 members, laid the corner-stone of a great new building on the west side in Chicago, which is to be the national headquarters. It is to cost \$132,000, exclusive of the site, and will occupy a prominent corner at the juncture of Milwaukee avenue and Augusta street. Besides providing ample offices, it will include a library, two halls and club rooms for the use of the 270 parish branches in Chicago, where the Polish population now exceeds 350,000.

##### JEWISH COMMUNAL DIRECTORY

Modeled in a measure after the "Kehillahs," or Jewish communities of the old world, and designed as a special authoritative and representative body of the Jews in New York, the Jewish Community, or Kehillah, of New York City was organized in 1909 by representatives of 500 organizations. In this the third year of its existence it issues the first annual number of the Jewish Communal Directory. Its 140 pages contain a list of 3,300 Jewish organizations, classified according to the purpose of each group and arranged alphabetically.

## HEALTH

THE reference Miss Eaton makes in her article on the eugenics movement on page 242 to the widely divergent opinions among scientists as to the inheritance of acquired characteristics, brings to mind a lively controversy that has been raging ever since the time of Darwin and that has had a profound effect on both sociology and moral science as well as on biology.

As is well known, Darwin believed that both through sexual selection and through adaptation to environment a gradual physical modification took place in the animal, and that this was handed down by inheritance. The most conspicuous opponent of this view has been Weismann, who holds that no outer influence can alter the germ plasm, and that only accidental variations inherent in the germ plasm are passed on to the offspring.

To take a concrete illustration, Darwin believed that the eyeless fish and crustaceans of subterranean rivers had reached this condition as the result of a gradual atrophy and disappearance of the eyes and optic lobes caused by lack of use, this change increasing from generation to generation. Weismann holds that from time to time accidental variations occur, and that when this variation happens to render the animal better fitted to his environment, as would be the case with eyeless individuals born in the darkness, these individuals are better able to propagate their kind. Their offspring inheriting this accidental variation hand it down and gradually displace the descendants of the normal but less well-adapted crustaceans.

Obviously, the time required by the Weismannian hypothesis would be aeons longer than that required by the Darwinian, but even if we accept the enormous lapse of time which this system of evolution demands, there are certain variations hard to explain by it. For instance, most dogs turn round and round in a circle before lying down to sleep. This is explained as a relic of the time when they were beasts of the jungle and were accustomed to tramping down the long grass to make a bed for themselves. As a gradually acquired habit, this is easily understandable, but it is hard to conceive that dogs born from time to time with this tendency should have had so enormous an advantage over their fel-

*Courtesy of Life and Labor.*

WHY THE BABIES ARE AT REST

lows in the struggle for existence as to succeed in displacing them altogether.

For many years Weismannism held sway, and was almost unquestioningly received by biologists and made the basis for ethical and sociological theories by medical men and economists, who did not know enough to examine it critically. Of late, however, there has been a strong tendency away from it and back to Darwinism. This is due to the revival of experimental work, a real return to the methods of Darwin, the secret of whose greatness was that he

never theorized without putting every step to the test of observed facts.

Peter Kropotkin gave in the November and December issues of the *Nineteenth Century* of last year a most interesting review of these recent experiments on the response of animals to environment and the influence of environment on the germ plasm. He says that these biologists have established one important fact, that besides the accidental, indiscriminate, indefinite variations of which the cause is utterly unknown, and which in their bulk must be kept within certain narrow limits, there is variation which is definite, discriminate, greater in its effects, and to a very large degree adaptive. It is impossible to give descriptions of the observations on which this statement is founded, for it would take too much space, but by way of illustration mention may be made of the rapid adaptation of certain lowland plants to Alpine conditions, an adaptation appearing in the daughter plant and showing more clearly still in the granddaughter; and also the changes in the sense organs of crustaceans, which are kept in the dark for several generations and then restored again to the light. The articles will well repay reading, and the impartial student will do well to read also the contrary view as expressed by Sir Ray Lankester in the September number of the same review.

\* \* \*

IN the report of the conference of the American Academy of Medicine, New Haven, 1909, there is an article<sup>1</sup> on the relation between large families and infant mortality, which confirms the position Miss Fiske takes on this ques-

<sup>1</sup>Excessive Child-Bearing as a Factor in Infant Mortality. By Alice Hamilton, Hull House, Chicago.

tion in her article entitled *Where Race Suicide Does not Prevail* on page 244.

An inquiry was made into the histories of 1,600 families in the neighborhoods of Hull House and the University of Chicago Settlement and these families were divided into two groups—the first including those with four children and less than four—the second those with six children and more than six. Families with five children were omitted. The results, calculated on a basis of 1,000 births, were for the small family group, 118 deaths under three years of age, and for the large family group, 267. The rate increased as the size of the family increased, as can be seen by the following table:

#### INFANT DEATH RATES IN LARGE FAMILIES

Families of 4 children and less 118 deaths per 1,000 births;				
"	"	6	"	" over 267
"	"	7	"	" 280
"	"	8	"	" 291
"	"	9	"	" 303

In discussing this paper, Dr. Theodate Smith of Clark University, gave a summary of the results of an inquiry into the history of the marriages of Harvard and Yale graduates, extending back over two hundred years. Apparently large families and an amazingly high infant mortality went hand in hand in early days in New England. Seven out of thirteen children dying in infancy, or even nine out of ten were not unusual instances. Following up the histories of 323 women it was found that many of their children were defective and did not live to maturity or did not marry, and that these very large families tended to be extinguished by the fourth or fifth generation.

\* \* \*

FOR the last few years, we have all been shocked and alarmed by successive epidemics of poliomyelitis, the so-called infant paralysis, which have appeared in widely separated places, have spread mysteriously without following the usual laws of contagion, and have caused death or hopeless crippling in children and grown people. Facts have been reported which seem to show that the contagion passed from person to person, and again other cases were reported occurring sporadically in remote country districts. That the disease is caused by a germ seems most probable, but exhaustive researches have failed to discover it.

No disease can be prevented or controlled unless we know how it is carried, and it is extremely difficult to discover the mode of transmission when the infectious agent has not been discovered. In the case of poliomyelitis, we do not know the virus, we only know that it is small enough to pass a filter which holds back the ordinary germs of disease. Other diseases caused by a filterable virus have been found to be conveyed from the infected to the healthy through the bites of insects, as for instance yellow fever, and it is natural that the minds of investigators should turn to the possibility of insect-borne infection in poliomyelitis. The investigation of

recent epidemics by the Massachusetts State Board of Health brought out evidence in favor of this mode of infection. The summer and autumn months are the season for epidemics, not the winter. It is a disease of the country and small town, rather than of the city.

Dr. M. J. Rosenau of Harvard reported at the recent International Congress of Hygiene in Washington<sup>1</sup> the results of his experiments to show whether or not the biting stable fly (*Stomoxys Calcitrans*) is a possible transmitter of the infection of poliomyelitis. He caused these flies to feed on the discharges of monkeys infected with poliomyelitis, and then caught the flies and imprisoned them in cages with healthy monkeys whom the flies then bit. At the time this report was made he could not speak with absolute positiveness of the result, because there had not yet been time enough to show whether the diseased spinal cord of the second series of monkeys would carry the virus to a third series.

\* \* \*

THIS missing link in the chain of evidence has just been supplied by Anderson and Frost, who report that they were able to transmit poliomyelitis from diseased monkeys to healthy ones through the agency of stable flies and to transmit the infection to a fresh monkey by injecting an emulsion of the cord of one of the animals infected by the flies.

In the early days of bacteriology, Robert Koch declared that in order to prove that a certain germ is the cause of an infectious disease, three postulates must be fulfilled: First, the infectious agent must be found in an enormous number of cases of the disease; second, this infectious agent, when obtained in pure culture, must be capable of producing in animals the disease in question, and third, it must be found again in the bodies of the experimentally infected animals. Of course, in the case of an invisible filterable virus it is much harder to fulfill Koch's postulates, because the presence of the virus can be proved only by its effect on a susceptible animal. Anderson's and Frost's experiments seem to have proved that the virus can be carried by the bite of the stable fly.

It is hardly possible to exaggerate the importance of such a discovery. Time was when the prospect of an outbreak of cholera or of yellow fever filled people with blind, unreasoning terror, now it simply rouses health authorities to vigorous preventive measures. During the last few years, parents have fled panic stricken from localities where poliomyelitis had appeared, because they knew of no way to shield their children from the infection. It remains, of course, for further work to determine whether the bite of this fly is the usual or the only method of transmission of this disease, but in the meantime the confirmation of Rosenau's theory will undoubtedly result in efforts by health authorities in cases where poliomyelitis has prevailed to isolate carefully all suspected cases and to eliminate the stable fly.

<sup>1</sup>See *Health and the Nations*. By Ira S. Wile, *THE SURVEY*, November 2, 1912, p. 147.

# THE EUGENICS MOVEMENT

AMEY B. EATON

DEPARTMENT OF SOCIAL SCIENCE, UNIVERSITY OF UTAH

The meeting of the First International Eugenics Congress in London in July brings to the attention more concretely the rapid growth of the new science of eugenics. Opinions differ widely as to the value of the meetings and some even agree with Peter Kropotkin that eugenics should not yet be dignified with the title of a science but that it is only a group of ideas, generalities and desires of a few people.

AS THE SURVEY has already stated, the congress proved to be rather an "exchange of views and mutual instruction than a scientific body equipped to work out a platform of concerted action." Yet to some, as to Prof. Raymond Pearl who writes in *Science*, the congress seemed a great success from every point of view, with an almost entire lack of the sensationalism and hasty generalization as to the solution of fundamental social problems which had been expected by the general public. No attempt was made toward a technically scientific congress since such a policy seemed unwise. In the eugenics movement an earnest attempt is being made to show that science is the only safe guide in respect to the most fundamental of social problems, "but if science wishes to lead, she must speak the same language as those she expects to follow her." The personnel of the attendance was of the highest rank, and from an international point of view, the congress seems to have given a valuable opportunity for a full discussion of eugenic problems as they appear in different civilizations and communities.

The reports as a whole seemed to show that in no country is research work in eugenics being carried on more widely than in America. An account has already been given in THE SURVEY of the aims of eugenics and a statement made as to the establishment of the eugenics record office at Cold Spring Harbor, Long Island, N. Y., in October, 1910. The work has been developed rapidly since that time, two more summer classes of field workers have been trained by Dr. Davenport and many more institutions in Massachusetts, Connecticut, New Hampshire, New Jersey and other states have since added such workers to their staffs and are now carrying on investi-

gations into the family histories of their patients, be they feeble-minded, epileptic or insane. The eugenics record office has published its findings in a series of bulletins, and two memoirs are shortly to appear. In these we undoubtedly get as thorough and scientific work as can be found anywhere in the treatment of eugenic data.

In addition to the work of the record office, many states are carrying on independent work in eugenics. For instance, in Virginia the State Board of Charities has been undertaking an investigation of their feeble-minded with a view to persuading their legislature to provide them a home for the feeble-minded where adequate custodial care can be given. On the ground that efficient government contemplates not only the immediate happiness of the people but also considers the citizens of the future and therefore is concerned for the improvement of the race, the New York State Board of Charities a year ago established a Bureau of Analysis and Investigation with special reference to eugenics, and an outline of its field and purpose may be found in THE SURVEY for September 21, 1912. In New Jersey, a eugenics bureau is also in process of formation and in Utah a state eugenics society is being planned. Other states are showing their interest in single phases of the movement and hardly one is not engaged in some eugenic work.

The literature of eugenics is growing apace. In England besides the works of Galton, Pearson, Bateson, and the Eugenic Memoirs, we have the writings of the Whethams' and Havelock Ellis's recent book, *The Task of Social Hygiene*, as well as six short studies called *Tracts of the Times*. The earlier studies in America included Dugdale's *Jukes*, Winship's *Jukes-Edwards*, and later we find Kellicott's *Social Direction of Human Evolution*, Davenport's *Heredity in Relation to Eugenics*, Jordan's *Heredity of Richard Roe*, Goddard's *Kallikak Family*, Kellogg's *Beyond War* and others touching other phases of the subject.

The eugenics movement is thus seen to have strong scientific backing in this country and abroad, but it is unfortunate perhaps that the

social worker looks with distrust upon the biologist and that the latter fails to appreciate the devoted and scientific work of the former. There is therefore emerging a new figure, the eugenicist, who is seeking to harmonize the two viewpoints, to show each the deeper value of the other, to attempt to co-operate with both and to lead both on to broader programs and concerted action.

Possibly no one is fitted to present the new position as adequately as does Havelock Ellis:

"The great movement of social reform during the nineteenth century has moved in four stages, each of which has reinforced rather than replaced that which went before; (1) the effort to cleanse the gross filth of the cities and to remedy obvious disorder by systematic attention to scavenging, drainage, the supply of water and artificial light as well as by improved policing; (2) the great system of factory legislation for regulating the conditions of work and to some extent restraining the work of women and children; (3) the introduction of national systems of education and the gradual extension of the idea of education to cover far more than mere instruction; and (4) most fundamental of all and last to appear, the effort to guard the child before the school age, even at birth, even before birth, by bestowing due care on the future mother. . . . Social hygiene may be said to be a development and even a transformation of what was formerly known as social reform. In that transformation it has undergone two fundamental changes. In the first place it is no longer merely an attempt to deal with the conditions under which life is lived, seeking to treat bad conditions as they occur without going to their source, but it aims at prevention. It ceases to be simply a reforming of forms and approaches in a comprehensive manner not only the conditions of life but life itself. In the second place, its method is no longer haphazard but organized and systematic, being based on a growing knowledge of those biological sciences which were scarcely in their infancy when the era of social reform began. Thus social hygiene is at once more radical and more scientific than the old conception of social reform. It is the inevitable method by which at a certain stage, civilization is compelled to continue its own course and to preserve, perhaps to elevate the race. . . . Eugenics constitutes the link between the social reform of the past, painfully struggling to improve the conditions of life, and the social hygiene of the future which is authorized to deal adequately with the conditions of life because it has its hands on the sources of life. On this plane we are able to concentrate our energies on the finer ends of life, because we may reasonably expect to be no longer hampered by the ever-increasing burdens which

were placed upon us by the failure to control life, while the more we succeed in our efforts to purify and strengthen life, the more magnificent become the tasks we may reasonably hope to attempt and compass."

In *THE SURVEY* for February 18, 1911, the editor took up a discussion of this new scientific viewpoint and in the light of it examined the current ideas of social workers and philanthropists with a view to testing them and presenting squarely the issue of whether the latter accept and utilize as they should these newly established ideas of heredity. He concludes that we may still consider the environment as the main field for the social worker but that we must accept the warning of scientists that heredity is a social fact. Is this a broad enough acceptance of the newer ideas or in the light of present work must we go further and admit that heredity and environment must equally demand the attention of every fair-minded person who is concerned with the greatest development of the individual and of the race?

That some of the broadest minds of the day are differing on these very issues is illustrated by a comparison of two articles in the *Popular Science Monthly* for 1910 or by a comparison of Dr. Davenport's book with the latter of these two articles. In April, 1910, Dr. F. A. Woods of Harvard writes: "Experimentally and statistically there is not a grain of proof that ordinarily environment can alter the salient mental and moral traits in any measurable degree from what they were pre-determined to be through innate influences." And from Dr. Davenport's book we learn that some scientists believe that many physical traits and many mental and moral characteristics are inherited; that there are definite unit characters in the germ cell which determine at birth whether or not an individual shall have possibilities of development along certain lines. In his chapter on the Geographical Distribution of Inheritable Traits, Dr. Davenport emphasizes his belief that the germ plasm is the source of the majority of human traits, be they for good or for ill. His opinion is corroborated by a psychologist writing in the *Eugenics Review* for July, 1912.

On the other hand in the *Popular Science Monthly* for October, 1910, Simon N. Patten writes on the Laws of Environmental Influence and tells us that "physical traits do not correspond to the virtues and vices emphasized by society. Social traits change from environment to environment, from group to group and even from family to family. The motives for adopting a virtue come to the individual through social influences. It is more reasonable to assume that the virtues a man cherishes are due to the society of which he is a part and not to the

germinal determinants that make up his heredity."

Such are the opinions of masters who look at the problem from different sides of the field, the one teaching the biologic lesson, the other the economic interpretation of history. Is it not these two conflicting viewpoints which the eugenist must seek to harmonize and correlate before the best results can be attained? The eugenist admits frankly that he has as yet no definite platform of concerted action with the object of proposing immediate legislation, but he asks attention for his viewpoint nevertheless and begs that it be given a more thorough and careful attention by all who are engaged in social and educational work.

The present need in eugenics is for greater knowledge, for a more careful intensive compilation and study of facts. As the charity organization movement has sought to correlate the social forces at work in our cities, may not state eugenic bureaus be formed gradually in all our states (as already in New York and New Jersey) which shall seek the co-operation not of biologists and social workers alone but of all who come in touch with the bio-sociological forces in the state—physicians, psychologists, educators, legislators and especially parents of all classes in their homes? Such bureaus should certainly consider first the work with defectives

but is there not also a broader constructive work which they can also carry out gradually? Eugenics is already being taught in some of our leading educational institutions and its wider extension in the educational system is strongly advocated by leading educators as by G. Stanley Hall.

Extremists in the eugenic field urge immediate legislative action but many scientific eugenists await further knowledge first. Consideration for racial welfare is of vital importance but if it comes too quickly or at the expense of individuals, it is not likely to be sound. Many concur with the opinion of one of the leading eugenists of England, Dr. C. W. Saleeby, in his belief that in the long run individual and racial welfare cannot be opposed to each other but are identical. Voluntary certificates of health before marriage and voluntary sterilization of those pronounced unfit by specialists are strongly to be urged. Except in the case of undeniable defect, we cannot go further except to ask for a consideration of the eugenic viewpoint in all social work, be it purely relief giving, be it working with children or families, be it even more broadly constructive. And so may we not build deeper and on a scientific basis that charity, spirit of brotherhood, sympathy and love of humanity which alone can give true value to any social work?

## WHERE RACE SUICIDE DOES NOT PREVAIL

ANNETTE FISKE

Much has been said and written these last few years upon "race suicide" and the possibility of remedying the "evil." The chief, if not the only, remedy suggested has been the encouragement of indiscriminate increase in the size of families. Ex-President Roosevelt has been prominent in advocating large families and the parish priest is usually an advocate of the birth of more children. Is such advice needed, however, among those who have small incomes with which to meet the high cost of living? What is the effect of a large number of children upon such families?

Those who know conditions, as district nurses and social workers, agree that the poor have far too many children as a rule. Where six or seven children are living there have often been three or four deaths. Miscarriages are numerous and are considered by the mothers as hardly worth mentioning. For a woman to bear nine or ten children is common; and fourteen or sixteen are far from rare. One Italian woman of twenty-seven, who had had nine children, expressed the general feeling of these mothers when she said she hoped she would have no more. Except for the rare exceptions, the mothers would be satisfied with two or three children.

When a family must live on \$9 a week or even less and there are seven, eight, nine, or even more children to be clothed and fed, what can

the home conditions be? People talk about the crowded quarters in the North End of Boston and of the breaking of the rules of the Board of Health regarding space per individual, but can conditions be otherwise with the present cost of rent and food? What wonder if an unskilled workman, having numerous mouths to feed, and having to pay from \$10 to \$16 a month for three rooms, lives with his entire family in one of them, rents one out for \$3 a month and allows still others to sleep in his kitchen for \$2.50. At best under normal conditions such families by skillful management may keep even in their money affairs, but if sickness comes, they are forced into debt. Weeks and months may pass before they are able to clear themselves, if indeed they ever succeed in doing so.

The mother's health and that of her children merit consideration. Even where the husband earns \$15 or \$20 a week, if the woman bears a child yearly,—and this is frequently the case,—she soon becomes a physical wreck. Under such conditions the children's health suffers from lack of care. Seven children in nine years or six children under six, the youngest two twins, (examples I have in mind), meant a severe drain upon the mother's system. It is essential that more time, say two or three years, should elapse between consecutive births to allow the mother

adequate time for recuperation. She may thus be enabled to nurse another child without detriment to herself, nor will the other children suffer neglect. These mothers know nothing of the hygiene of pregnancy or, if they do, are unable to follow it. They must work up to the last minute, and must begin again as soon as their strength permits, frequently the day after the child's birth. The housework must be done, the children must be fed and some need the nimble fingers of the mother to dress them. The mother must keep at work while power is forthcoming. The care at the time of confinement is most defective, so that it is not strange that ill-health and discouragement are prevalent. One mother, a sensible little woman, with a husband earning \$10 a week, bore three little ones less than a year apart. After the birth of the third baby, she felt miserable physically and mentally. Unable to get any rest, housed up constantly, she became desperate. What wonder that she meditated suicide or at least an abortion if she were to become pregnant again. Possibly she was not as good a manager as some; but mothers must be taken as they are and to increase their burdens beyond their strength in no way makes them more efficient.

Another woman, very capable, with a husband whose irregular work pays well, has had seven children in nine years and is worn and wan. Each birth places her between life and death. Weakened, house-ridden by the demands of her family, hopeless of better conditions in the future, is it strange that she does not care whether she lives or dies?

A third woman, only thirty-eight years old, has had sixteen children. Thirteen, including three sets of twins, came within fourteen years. Seven died. The doctor finally said that her health demanded that she have no more children.

Some of the social effects of such rapid child-bearing were disclosed by a study of 225 families in which the children were either numerous or followed each other at too short intervals, such as three children born in four years. The youngest child in each of these families was taking milk from a milk station in Boston or vicinity or in Fall River. Some were still nursing when the data were gathered. The mothers were, therefore, still within the child-bearing age, the majority being from thirty to thirty-five although the ages varied from eighteen to forty-five. Many of the mothers looked older than they were and few were in really rugged health. With thirty of these families I have had personal acquaintance. Undoubtedly some children have been born and died of whom I have no knowledge, while miscarriages are seldom mentioned unless specifically asked for. As a well-known worker said of a family in which births were recorded for 1892, 1893, 1895, 1897, 1899, 1901, 1906, "there were doubtless some deaths or miscarriages between 1901 and 1906."

The nationalities of the families were largely Italian, Irish and French-Canadian. The weekly income of a majority was from \$6 to \$10 a week. In some cases it fell as low as \$6 or \$7; rarely it rose to \$15 or over.

## CHILD MORTALITY IN LARGE FAMILIES

No. OF CHILDREN IN FAMILY.	No. OF FAMILIES.	AGE OF OLDEST CHILD.	TOTAL No. CHILDREN BORN.	No. DEAD.
3	4	3 years	12	4
4	3	8-5	12	5
5	8	8-5	40	13
6	12	16-8	72	22
7	57	14-8	399	78
8	61	20-8	488	82
9	36	29-11	324	82
10	13	22-13	130	25
11	12	-14	132	46
12	7	24-15	84	31
13	7	24-14	91	27
14	2	21	28	7
15	1	23	15	9
16	1	21	16	12
18	1	23	18	8
Totals... 225			1861	451

It is obvious that only fifteen families (6.6 per cent.) had five children or fewer—while thirty-one (13.7 per cent.) had over ten children. The rapid child-bearing is sufficiently indicated by comparing the number of children born per family with the age of the oldest child. When two figures are used it indicates the difference between the ages of the oldest children in those families.

The total mortality of 451 out of 1,861 equals 23.7 per cent. though the age at death was not accurately ascertainable.

The total number of families with the varying number of children is too small for statistical purposes but there is a suggestion that the larger the number of children, the higher both the absolute and relative mortality. This is in accordance with the general experience of those who have investigated large families. Another reason for presenting the figures without long discussion is the fact that it hardly seems fair to compare the mortality of families with three children under three years and those with seven children under eight to fourteen years, if the mothers are still within the child-bearing age. For a careful study it would be desirable to have the families complete in the sense that further children could not enter to disturb percentage calculation. It is sufficient to note that on the basis of the figures presented the average number of children born was over eight and the average number dying was two. It is probable that most of the deaths occurred under two years in accordance with the general curve of infant mortality.

The effect of rapid child bearing is not apparent from the tabulation, but the appearance of the broken mothers and weakened children pleads for more rational intervals between consecutive births if children are to be numerous. A brief reference to the details of some particular families may be of value in showing the difficulties for family development in the face of many children born at short intervals.

Three children—One young mother of eighteen, who had been married at fifteen, lost her first baby, had one living fifteen months old and another had just come. Mrs. C. had had three children at intervals of about two years but lost them all through improper feeding.

Four children—Mrs. A. had four babies and

three miscarriages in eight years. All of the babies were prematurely born because of the mother's kidney trouble and two of them died.

Five children—In one family the youngest were twins, born when the next older child was less than eleven months old. These twins weighed about three pounds each and lived only a few weeks. In another family the father of five living children made only \$6 or \$7 a week.

Six children—Of Mrs. M.'s six children, the oldest was eight years and the youngest five months. She lost two. Her husband abandoned her suddenly before the last baby came.

Eight children—Mrs. S. had eight sons in ten years and was a physical wreck. Mrs. Sh. and Mrs. G., though like Mrs. S. they had lost no children, were also worn out, while Mrs. T. was enervated. Mrs. V.'s oldest child was nine years old and she had lost her last two babies of marasmus at the age of two or three months. Soon after the death of the last she found herself again pregnant. She is a woman who gets up the day after the baby is born and does all her own work. Needless to say, she looks nearly twenty years older than she is, though in fairly good health. In this case both father and mother told me they thought too frequent births was one reason why the last two children had died. "They," meaning the priests, "keep telling us to have children," the father said to me, "but it seems to me the children cannot have good health when they come so close together and it is hard to raise such a large family."

Nine children—Five were still-born in one family. Mrs. H. lost two though she was more intelligent than the average and had given them good care. Mrs. P. lost six. Both she and her husband are consumptive, and she is a miserable physical wreck. Her youngest child is a few months old. Mrs. S., whose oldest child was sixteen and who was expecting another, was in fair health, but she seldom got out of doors.

Ten children—Mrs. R., whose oldest would have been fourteen if it had lived, had lost two and she expected another baby. Her husband works away from home and sends her only \$8 a week.

Twelve children—In one family where the oldest was twenty-four there were two deaths, while in another, where the oldest was only fifteen, there were seven deaths.

Thirteen children—One woman had thirteen children in fourteen years and a half, of whom three died. The father earned \$6 a week.

Fourteen children—Mrs. V., aged thirty-three, had had fourteen children, the oldest twenty-one and the youngest two-years. Of these three died in early infancy of cholera infantum. All but the youngest were rachitic.

"The children come fast, usually as fast as nature will allow. As the family increases there is more demand for food and clothing, but the family income does not increase to meet the demand upon it. In fact, it is more likely to decrease, as the woman grows weaker with child-bearing and child-raising and is less able to supplement the income by outside work. In many families the man patronizes the saloon every night in the week and spends half his earnings

on drink." Such are the conclusions of a district nurse in the northern country districts near Canada and such are the conclusions of most nurses working in the poor districts of the city.

Poverty and large families go hand in hand in more senses than one. Life becomes cheap, though these parents cling to their children with strong affection, unwished-for as they may have been. Who can wonder that with such small incomes and with only the mother to attend to the house and household, the addition of each child is dreaded? Only more work and care and possibly sickness is in store for the mother. The husband who spends much on drink or gambling is not to be wholly condemned. To come home after a hard day's work to an untidy house full of children, whom the mother has scant time to train, is not calculated to encourage rest and relaxation. A good manager is necessary to care for a lot of children besides keeping three or four rooms neat, and it is not strange that the weary and discouraged mother becomes careless. Fretfulness and nervousness prevail and life is far from cheerful. Drunkenness is a common vice among these fathers, and though one can hardly call one effect and the other cause, the discouragement consequent upon having a large family and a small income leads to drinking, and lack of self-control in one line of conduct tends to lack of self-control in other lines.

Among these families, the work of a friendly visitor and district nurse is needed above all others. The mother's health should receive attention before the child comes. Let her be taught the simple rules of good health and the father persuaded to put her in a position where she can follow them instead of being subject to overwork and disease. She needs to be instructed in the care, especially the feeding, of the baby. The importance of breast feeding must be emphasized. Better training in housekeeping should be given to the daughters. But the situation reaches deeper.

Large families are good where the parents have good health and are able to give the children proper food and education. Parents with tuberculosis or some other serious disease should not bring miserable defective children into the world year after year, nor should parents give birth even to innumerable healthy children for whom they have no means of providing either physically or in the way of education.

I am not criticizing the poor. I know what they have to contend with—continuous days of labor spent in a struggle to make both ends meet and with small share of enjoyment of a healthful kind. But better fewer citizens than an increase of weak ones. The welfare of the family should be above personal gratification. Better the spread of newer ideals for childhood—to make one's children above all things sturdy, able and good citizens, than the preachment of frequent children. Women can teach the mothers the ways of health, can interest the daughters and sometimes the sons in wholesome home pleasures, but to persuade the men to be wise in their fatherhood, this is a work for men. Who will show the way?

# SOCIAL AGENCIES

## WHAT WILL NEW YORK DO ABOUT BROOKLYN?

FRANCIS H. McLEAN

GENERAL SECRETARY AMERICAN ASSOCIATION OF SOCIETIES FOR ORGANIZING CHARITY

New York has been held these many years as the city of lost opportunities. To the just-budding city awakening to social and civic responsibilities, it has furnished an inexhaustible store of warnings. For him who is trying to guide newer communities aright, the most useful of weapons has been the costliness of New York's hindsight, particularly the slow progress in housing reform with its terrific toll in disease, and the amazing expense of letting in a little sunlight and green in congested neighborhoods where small parks and playgrounds were not thought of until it became necessary to tear down valuable buildings to make room for them.

There is clearly facing the city today a new problem which requires foresight, or again hindsight will be a tremendously costly luxury. This problem concretely stated is: Will the business community of the Borough of Manhattan recognize its equal responsibility toward the proper development of progressive social agencies in all the residential and manufacturing boroughs of the city? More particularly, will it recognize that there is need of taking a greater-city view in this respect regarding the newer parts of the city? So far as the Bronx is concerned, it has in social development been the complement of Manhattan, both being part of the old city. There is as yet little need of wider attention being given to the Borough of Richmond. Queens is another story. It must first have an internal awakening and coalescence and develop a borough spirit.

Brooklyn is fast becoming the city's biggest problem on the social side, and to solve it there is need for the concentrated attention of the business interests of the city. No one will dispute that Manhattan, as the years go by, will become more and more the exclusively business and commercial center of the city, and that Brooklyn will become the greatest residential and manufacturing section.

Some interesting figures regarding schools have recently been made public. The school registration for the present term as given out by City Superintendent Maxwell shows a total of 272,212 for Manhattan and 254,097 for Brooklyn—Brooklyn is second by 18,115. But in 1906 the average daily attendance for Manhattan was 228,857, and for Brooklyn 175,517, a difference of 53,340. In 1911 the average daily attendance for Manhattan was 243,641, and for Brooklyn

216,971, a difference of 26,670. Thus from 1906 to 1911 the increase was 6.45 per cent for Manhattan and 23.61 per cent for Brooklyn.

These school figures give the most emphatic evidence that, so far as the life of the people is concerned, Brooklyn will soon become more important than Manhattan.

Turning to total population, the census shows that from 1900 to 1910, Brooklyn grew from 1,166,582 to 1,634,351, an increase of 467,769; while Manhattan grew from 1,850,093 to 2,331,542, an increase of 481,449. In the last years of the decade Brooklyn was growing much more rapidly than Manhattan, and in the year following the census the increase in Brooklyn was 129,584, as compared with 96,618 in Manhattan, according to the estimates of the Department of Health. The average percentages of increase during the decade were 2.6 for Manhattan and 4 for Brooklyn, but during the last year the increase in Brooklyn was over 7 per cent, and this ratio will be still further increased when the tunnels which have been authorized are bored under the river.

Joseph Cacavajo, an engineer whose estimates are used by the Brooklyn *Eagle*, believes that 1915 will show the high-water mark of Manhattan's population at 2,633,000, with 1,975,000 for Brooklyn. His estimates, and those of another careful estimator, Walter Laidlaw, secretary of the Federation of Churches, for succeeding decades commencing with 1920 are:

	MANHATTAN	BRONX	BROOKLYN
	1920		
Cacavajo .....	2,500,000	950,000	2,500,000
Laidlaw .....	2,410,933	862,323	2,320,364
	1930		
Cacavajo .....	2,500,000	1,600,000	3,500,000
Laidlaw .....	2,132,365	1,438,088	3,074,315
	1940		
Cacavajo .....	2,250,000	2,400,000	5,000,000
Laidlaw .....	1,495,778	2,158,221	2,895,935
	1950		
Cacavajo .....	2,000,000	3,250,000	7,000,000

From 1902 to 1911 inclusive the number of plans for new-law tenements filed with the Tenement House Department were: Manhattan 5,376, Bronx 5,162, Brooklyn 13,813 and Queens 3,643. The total of tenement buildings and apartments registered in the department is:

	NEW LAW	OLD LAW	TOTAL
Manhattan .....	4,674	36,546	41,220
Bronx .....	3,881	4,021	8,802
Brooklyn .....	9,694	37,203	46,897

Nothing is shown here as to relative sizes of tenements, but the figures are offered as showing that Brooklyn today has more tenements to be watched than Manhattan.

These are but a few indications of one important fact—that in the gradual pushing out of population from Manhattan, fan-shaped Brooklyn, with its focus against Manhattan and opening toward Long Island and New England, will become the home of an increasingly larger proportion of the population of the greater city.

What this gradual ascendancy of Brooklyn in city affairs means politically has been already sensed. Manhattan will concentrate more and more of the wealth, but no matter how great that concentration may be, it will be governed by the masses of Brooklyn where the votes will be. It is fashionable now to reduce social consideration to terms of enlightened selfishness. To follow that fashion in this connection, what Brooklyn is and what Brooklyn will be is of the utmost importance to the business interests of Manhattan, because politically Manhattan's ascendancy is on the wane. The attempt of one important political society to stretch its tentacles across Brooklyn Bridge indicates a sagacity which has not been evidenced as yet by Manhattan's business interests in the social field.

I have tried to show that as the financial, trade and commercial center, Manhattan must be interested equally in the social field in all the boroughs and particularly in Brooklyn. Now if it had happened that in the different boroughs there lived fairly equal proportions of all kinds of resourceful men, one might say that there was no need of considering the city-wide social responsibilities of the trade center. Each borough having its fair share of the resourceful, the more resourceful, and the most resourceful, would look after itself. But even if that were so, it would not be a fair view. There is, and has always been, the greatest temptation for the Brooklyn man with a Manhattan office to become more interested in Manhattan's than in Brooklyn's social agencies. They are for the moment larger, they are closer to him during his working hours, Brooklyn is only his sleeping place. Furthermore, there are the many who reside in suburban places; what of them?

Cogent as are these reasons for Manhattan to view its social responsibilities as a center from which to supplement local resources rather than to consider that it has only the responsibility for the old city, there is now added another and overwhelming reason. There has been for many years a trend of the more resourceful away from Brooklyn. Witness, for instance, the remarkable transformation which is taking place in that fine old residence section, Brooklyn Heights, where apartment houses and boarding houses are taking the place of the splendid old homes. Witness the

almost complete transformation of Williamsburgh from a quiet residence section to a new East Side. Witness the tide flowing on until it is now beginning to lap around the Bedford section. There are, of course, many resourceful people left and others have come in to the newer sections, but proportionately to increase of population, social resourcefulness, that is, surplus of means and of leisure available for altruistic work, has decreased.

The surplus wealth is going to Manhattan in much greater proportion than to Brooklyn. Such sidelights as these are not uncommon, for instance, in the social field; in Manhattan the hospitals receive about one-half of their support from private resources, in Brooklyn about one-fifth. It is not claimed that the people of Brooklyn are supporting their social agencies to as just an extent as they should. There is constant need of propaganda. But on the other hand, it is unjust, unfair and impossible for them to carry the whole burden. The center of the city must help.

Brooklyn is the problem of the city.

It is interesting to note in merest outline, the growth of social agencies in Brooklyn and in Manhattan and Bronx taken together. The New York Charities Directory shows the following:

	MANHATTAN AND BRONX	BROOKLYN
General relief societies.....	41	8
Day nurseries and kindergartens....	101	88
Nursing and care of sick in their homes .....	45	9
Asylums, houses and cheap lodgings for children.....	39	25
Children's societies.....	8	7
General hospitals.....	39	22
General dispensaries and out-patient departments .....	45	27
Relief hospitals, homes and societies for cripples.....	37	3
Vocational and special education....	50	16
Social settlements and neighborhood houses .....	58	17

Here again we are offering the relative numbers without reference to importance or worth. Still the comparison is significant. Anyone who knows the social field in Brooklyn will unhesitatingly affirm that private social effort is far less developed than in Manhattan, and that the agencies are continually and increasingly embarrassed by lack of support. Meantime the social problems grow.

How will the commercial core of New York grasp this problem which so vitally concerns it? And how will those wealthy and philanthropic residents of Manhattan who are no longer in business view it? Will they, with foresight, commence to support and interest themselves in the private social agencies of Brooklyn as they do in those of their own borough and of the Bronx, or, with hindsight, will they wait for the deluge? The deluge may be anticipated. Will it be? Have the lessons of the last thirty years been learned or not? Is it not time for a Greater New York social spirit?

## A SECOND ETHICAL CULTURE MEETING HOUSE

MARY E. BALCH

Executive Secretary Society for Ethical Culture of New York

The new meeting house of the Ethical Culture Society recently dedicated in St. Louis is the second of the kind in this country. In England, the West London Ethical Society likewise meets in a building of its own. The American societies in Brooklyn, Chicago and Philadelphia, the German societies, and most of the English societies meet in hired halls.

The New York Society, the parent organization, was founded in 1876. All those since established, both here and abroad, have the same essential purpose. This is to promote a spiritual conception of human progress and to infuse it into the educational system, into politics and into social reform. The aim is to spread the conviction that the kind of inner experience, which is called ethical, is the highest of which man is capable and that in it he touches the divine.

It is contended that the ultimate higher ends, which all material improvement must subserve, should be kept prominently in view throughout efforts at reform. Two reasons for this are given: first, because the end is likely to be forgotten wherever the means are constantly emphasized without explicit reference to the end; and, second, because the material improvements desired—the shorter hours, the larger income, the better housing, and all the rest—are likely to be achieved much more surely if the appeal for them is made in the name of the spiritual quality of the human beings affected, rather than if made in the name of their physical needs.

## JOTTINGS

### MORAL NURTURE OF YOUNG

One of the suggestions at the Second International Congress for Moral Education, which met at The Hague, was that the next congress consider to what extent it may be legally and practicably possible for school authorities to exercise censorship over school neighborhoods. This was but one proposal in line with the general purpose of the meeting, to consider aims and means in the moral nurture of the young. The first congress was held four years ago, impetus having come from the International Union of Ethical Culture Societies, of which Felix Adler is chairman. It was the first time in the history of education that men and women from Europe, Asia, Africa and America had come together to discuss this subject.

In spite of differences in race, religious belief and ethical customs there was general agreement at this second gathering that the task of moral education is enormous and that inadequate steps have so far been taken to meet its challenge. Clergyman and layman testified to a widespread consciousness that church and school, home and state, have somehow failed to live up to their full responsibilities. The reasons for this were differently assigned, according to the convictions of the accuser. The clergy put the blame upon the growing infidelity of the times.

On the other hand Dr. Mouton, a Netherlands physician, conceded that in his country moral principles have grown lax in spite of the fact that only 6 per cent of the population are not recorded as church members. Some of the difficulties sounded familiar to American ears. An educator from Barcelona, speaking of the moral dangers of city streets, referred to the moving picture show in terms that might have applied to New York or Chicago. He recognized the good in this form of amusement but deplored the extent to which it excites taste for scenes of passion and violence and gratifies "nervous inquietude and superficiality."

### BROOKLYN WORK OF PEOPLE'S INSTITUTE

A Brooklyn committee of the People's Institute of New York has been organized to conduct a series of Sunday concerts and lectures in the Commercial and Manual Training High Schools. The committee includes three trustees of the institute and seven additional local members. A secretary and treasurer will be appointed. All funds raised in the borough and by collections at the meetings, which it is hoped will be self-supporting, are to be devoted to extending the Brooklyn work. The project is an outcome of the experiment conducted last year under considerable difficulties at the Commercial High School by Edward W. Ordway. This was so successful that it helped to win over the Board of Education to the broader use of the school plant. Besides a number of noted speakers, the musical program includes a recital by Mr. and Mrs. David Mannes and concerts by the Darmreuther, Olive Mead and Kaltenborn String Quartets, the Brooklyn Choral Society and other musical organizations. Music and open discussion will be a feature at each of the lectures.

### A CROWDED PENITENTIARY

By order of Governor Hadley, sixty convicts under twenty years of age, will be transferred from the Missouri penitentiary to the state reform school. A dormitory there for this purpose has been completed, and the newcomers will thus be separated from the still younger offenders. There are today 2,455 convicts serving time in the Missouri penitentiary. No prison in any civilized country contains so many inmates, it is declared.

### COTTAGE HOMES DEDICATED

The new cottage homes of the Hebrew Sheltering Guardian Orphan Asylum have been dedicated at Pleasantville, N. Y. Seventeen of these, accommodating thirty children each, an administration building and a number of school buildings in which vocational training is given, occupy a beautiful stretch of land in which there is ample provision for playgrounds and recreation. Ludwig M. Bernstein is at the head of this institution.

<sup>1</sup>The four volumes of European papers may be had from Attle Dyserlnuck, 78 Bilderdijkstraat, The Hague; the American volume from the American Committee of the International Moral Education Congress, 2 West 64th Street, New York.

## JOTTINGS

### A EUGENICS FIELD WORKER

Mrs. E. H. Harriman has contributed \$1,000 and George F. Baker \$250 toward the salary and expenses of a eugenics field worker for Orange and Rockland Counties, New York. The work is to be carried on under the joint auspices of the Eugenics Record Office at Cold Spring Harbor and the New York State Charities Aid Association, which maintains county agencies for dependent children in these and eleven other counties in the state. Mrs. Harriman has for some time been interested in the scientific investigation of significant family histories. A large amount of material of this sort is now on file in the offices of the county agents, and it is thought that if this could be supplemented by further investigation, correlated and interpreted, it would undoubtedly become of great value.

The association estimates the expense of carrying on the field work for one year at \$1,800. Florence Givens Smith has been appointed to carry on the work. Miss Smith has had experience both as agent of the Philadelphia Society for the Protection of Children from Cruelty and as the Columbia County agent for the State Charities Aid Association.

### INVESTIGATIONS ON REQUEST

In response to demands which have come during the past two years for competent and trained investigators, the Department of Research of the Massachusetts Women's Educational and Industrial Union has recently established under its supervision a Bureau of Investigation to conduct social or economic inquiries for or in co-operation with individuals or organizations. The work will be under the supervision of the director and assistant director of the department. The investigators composing the staff will be graduates of colleges who have had training in investigating and interpreting results. Where expert knowledge is required, such as a knowledge of medicine, the department will secure the co-operation of experts.

In addition to doing the field work of investigation the bureau is prepared to interpret data previously collected and to prepare reports.

### PROGRESS OF INCOME TAX AMENDMENT

That the income tax amendment will become law before March 4 now seems likely. Thirty-four states have ratified the amendment, which will vest Congress with the right "to lay and collect taxes on incomes from whatever source derived, without apportionment, among the several states, and without regard to any census or enumeration."

Adoption of the amendment by three-fourths of the states is necessary. Thus the assent of only two more states is required.

### BOY SCOUTS AIDING CONSERVATION WORK

Following a conference between Governor Dix of New York and leaders of the Boy Scouts of America, the scouts of New York state are planning to co-operate in the state conservation policy. It is proposed that the state shall furnish scouts with literature designed to interest and inform them in regard to the conservation, good roads and similar movements. The scouts, on their part, will furnish the names and addresses of those scout masters who are willing to respond, with their most experienced boys, to the summons of the fire warden to aid in putting out forest fires. Boy scouts will also be liable to be called upon to aid in tree planting and other works included in the reforestation plans of the state. It is believed that the educational side of this plan will show that the boys can be made useful in many other ways to the conservation movement.

### A SOCIAL MUSEUM IN THE WEST

The Commonwealth Club of California, through R. S. Gray, chairman of its library committee, has inaugurated a movement looking to the organization and establishment at the Panama-Pacific International Exposition of 1915, and perhaps its ultimate retention in San Francisco as a permanent exhibit, of a so-called Social Museum, an exhibition in comprehensive form of the things that have been and are being done toward the betterment of living conditions and the advancement and perfection of the human race.

### COURSES IN SOCIALIST THEORY

Among the courses offered for the season 1912-13 by the Rand School of Social Science, 140 East 19th Street, New York, are American History and Government by Max Schonberg; Economics by Algernon Lee and John Spargo; Socialist Theory and Policy by the same lecturers, and Social Problems and Reform Movements by Meta L. Stern, John Spargo and others.

### DATE OF NATIONAL CONFERENCE

The fortieth meeting of the National Conference of Charities and Correction to be held in Seattle, Wash., will convene Saturday, July 5, 1913. A bulletin of the conference announcing this fact contains a list of all the state conferences of charities and correction and kindred organizations in the country.

### DIPLOMA FOR INFANT MORTALITY EXHIBIT

Because a line of type was misplaced in THE SURVEY for November 2 it was not made clear that one of the sixteen organizations to receive diplomas of superior merit for exhibits at the recent Fifteenth International Congress of Hygiene and Demography was the American Association for the Study and Prevention of Infant Mortality.

## OUR CUSTOMERS LAND SHOWS INCREASES

### Did You Ever Hear of a Better Record For an Investment Company?

**A**T the bottom of this page we give you absolutely convincing testimony of the great advances made in our Brooklyn lots since they were sold to the public all over the United States, in fact, all over the world. These examples are only the smallest fraction of the number we could give you, and these are only as a drop in the bucket to the number that will be shown five years hence when the enormous subway system of the City of New York is completed.

Remember, please, that the City of New York is building a system of transportation at a cost equal to that of the Panama Canal, and which, when constructed and built in accordance with full plans will be in easy access of every lot in the Greater City of New York owned and controlled by Wood, Harmon & Company. The City expects to make all its vacant land worth millions more than it is to-day, in order to furnish money to build more subways.

We guarantee to give you a lot for \$890 within five minutes' walk of one of the subway lines laid out by the City, and approved by the Board of Estimate and Apportionment and validated by the Mayor. No such proposition will ever again be offered to the public, and the supply of \$890 lots is strictly limited. Will you not write for particulars? To-day.

## New York City Lots \$890 \$10 DOWN \$7 Monthly

**You do not want to know what one person out of a hundred has done, but  
You do want to know what one hundred people out of a hundred can do.**

The following one hundred illustrations of the prices at which we sold lots and the value at which they are now assessed for tax purposes are not selected cases, but are the first one hundred accounts taken from the first three properties we opened in Brooklyn.

The valuations of a city Tax Department are generally accepted as conservative. We consider this evidence the best we can give. If there is any better, we do not know what it is. We give the ledger pages so that any one who wishes can verify this statement either now or five years hence.

HELP THE SURVEY BY MENTIONING US WHEN WRITING TO ADVERTISERS

Beginning with his boyhood, when, as he says, going to church was to him, while not a hardship, "certainly not an enjoyment," he tells, in a delightfully intimate and personal way, the two ministers who most influenced him; what led him to turn from the law to the pulpit; his varied experience as a minister; the churches in which he has preached; the folks he has found in church.

Out of this wonderfully ripe experience he tells what his half-century in the pulpit has taught him about some problems of the church and the people; wherein the church fails to reach the people and wherein the people fail to understand the church; what a church has a right to expect of its minister; what makes a great minister; what is the place of the minister's wife and what he believes will be the church of the future.

In the first article Doctor Abbott answers, as it has never before been answered, the question, "Why Should I Go To Church?" This will begin the series

## IN THE JANUARY LADIES' HOME JOURNAL

The Curtis Publishing Company, Independence Square, Philadelphia

## THE PITH OF IT

**L**AST winter the New York legislature enacted a law limiting to fifty-four hours a week the employment of all women in manufacture. This law is similar to existing statutes in Massachusetts, Michigan, Missouri and Ohio. California and Washington in 1911 enacted eight-hour laws for women in factories and many other occupations. As soon as the New York law went into effect on October 1, candy manufacturers decided to test its constitutionality. A test case was brought in Brooklyn, where William Hoelderlin had himself arrested on October 7 for violating the law. He was released on a writ of habeas corpus. The case was adjourned by Magistrate McGuire, and it probably will be argued next week before Judge Abel E. Blackmar of the Supreme Court, Second District.

**B**OARDS to fix wages arbitrarily, just as the Interstate Commerce Commission fixes rates, is one of the proposals of the Board of Arbitrators in the wage controversy between the locomotive engineers and the railroads east of Chicago. In their report made public November 24, a wage increase is granted which is estimated at \$3,000,000 in the aggregate instead of \$7,000,000 which would have been the annual increase if the engineers' demands had been granted.

**A**LMOST unnoticed in the out-of-town press, a dramatic battle against the segregation of commercialized vice had recent setting in Chicago. At public hearings held by the City Council the forces of representative citizenship were practically unanimous, declares Graham Taylor, in opposing segregation and in rallying to the summons of the Vice Commission: "Constant and persistent repression of prostitution the immediate method; absolute annihilation the ultimate ideal." P. 254.

**I**N spite of the suggestion that only appropriation bills will be considered during the congressional session which opens December 2, there are hints of an intention to amend the Federal Workmen's Compensation Act. The main criticisms are that it does not include all government employes and that the compensation is not liberal enough. P. 251.

**L**AST week the first loan shark to be jailed in New York County was sentenced to sixty days and fined \$250. A fortnight before a court had ruled that borrowers could recover twice the amount of all usurious interest actually paid over. With such blows as these delivered in what has long been regarded as the very citadel of extortion, there is good reason to believe, thinks Arthur H. Ham, that hard times await the very leeches who live by the adversities of others. Pp. 251 and 256.

**B**AKERY products, sanitation of tenements, vaults, the city's milk supply, and the heating and ventilation of street cars are the subjects of five bills which are being urged by the St. Louis Council of Civic Organizations. P. 252.

NOVEMBER 30, 1912

## THE COMMON WELFARE

### CONGRESS AND COMPENSATION

In spite of the semi-official announcement of leaders of both houses of Congress that there will be practically no legislation or attempt at legislation this winter other than the consideration of appropriation bills, there are indications that a determined attempt will be made to amend the federal Workmen's Compensation Act before March 4. This act became effective August 1, 1908. It applies only to artisans or laborers employed in certain specified branches of the public service, or in certain hazardous occupations under the government. By its terms any workman covered by the act who is injured in the course of his employment is entitled to receive for one year thereafter, unless able to resume work sooner, the same pay as if he continued to be employed except where the injury is due to his own negligence or misconduct.

The main criticisms directed against the present act are that it does not include all government employes, and that the amount of the compensation is not liberal enough. The solicitor of the Department of Commerce and Labor, who has been making a special study of the matter, urges the necessity of extending the law, and cites in this connection the fact that over 17,000 accidents were reported under the act during the first three years of its operation, whereas only about 8,000 claims were filed, due to the limited scope of the law. The secretary of commerce and labor is on record as favoring the enlargement of the scope.

It is thought likely, therefore, that the Com-

mittees on the Judiciary of the House and Senate will be asked to consider this legislation early in December.

### NEW WEAPONS IN THE WAR ON LOAN SHARKS

On November 8 the Appellate Division of the Supreme Court of New York handed down the decision which Mr. Ham in his editorial on page 256 declares ruled "that usurious loans are void as to both principal and interest and if usury has actually been paid the borrower may recover twice the excess paid in all transactions within a period of two years." This is the latest prop to be removed from the loan shark's structure of chicanery and extortion.

The case grew out of a loan made to one Alexander Dunscomb by a lending concern which called itself the Royal Company, and whose directors were Mark and Philip Sugarman and Frank C. Stratt.

Dunscomb had borrowed \$47.50 and had paid the company \$2.50 a month for twenty payments. He used to go to the office each month, give them his salary of \$50, and receive back \$47.50 of it—making him a new loan, they called it. Finally Dunscomb refused to pay more and the Royal Company sued. Dunscomb brought a counter-suit to recover double the amount of usury he had paid. The Municipal Court allowed him double the amount of the last payment he had made. His counsel appealed on the ground that this was inadequate relief and the result was the reversal by the appellate division, granting recovery of double the sum of all payments.

The establishment last July of a usury bureau in connection with the district attorney's office, as mentioned also by Mr. Ham, is another weapon that has proved effective in the war on usurious lending. This bureau can bring criminal prosecution only. In a recent report to District Attorney Whitman, Franklin Brooks, who has been in charge of the bureau, urges the establishment of a civil legal aid office to work in conjunction with the usury bureau. Such an office, says Mr. Brooks, could defend all victims civilly with the result that the money lender might be made to lose the amount of his loan by proof that it is tainted with usury and therefore void.

#### FIVE BILLS FOR PUBLIC HEALTH

A campaign to create public sentiment in favor of five bills for the protection of public health is being carried on in St. Louis by the Council of Civic Organizations. This body, comprising eighteen of the leading organizations which are working for civic improvement, has a membership of 8,000. It proposes to discuss these bills before all the social and business associations of St. Louis. The measures, which have already been introduced into the municipal assembly with the approval of the board of health, are as follows:

For the wrapping of bakery products in clean paper.

For the sanitary care of tenements and for running water on each floor of such buildings.

For the abolition of the 20,000 vaults in St. Louis within five years.

For regulating the city's milk supply to insure absolutely clean and pure milk.

For the proper heating and ventilation of street-cars.

As the result of an investigation of the cost of wrapping bread in sanitary paper, it is declared that when the bread is handled in small quantities, this cost would be less than one-eighth of a cent a loaf. When handled in large quantities, the cost is much less. The bill provides that all vehicles in which bakery products are transported must be clean and sanitary.

The tenement house bill has been introduced by the Real Estate Exchange, which represents the owners of property that would be affected by the bill. The measure provides that there must be one sink to furnish running water on every floor of a tenement house; that all parts of the house shall be kept in good repair and that tenants must keep them clean; that a caretaker must be employed for each house of eight families or more; that common hallways shall be properly lighted; that cellars shall not be used for living purposes and that buildings shall be properly ventilated.

The vault bill is considered by the council to be one of the most important in the group. Its framing at this time calls to mind the notoriety given to St. Louis vault conditions two years ago when a group of housing and civic experts attending the National Conference of Charities and Correction toured the city with newspaper reporters and elevated the facts about privies to the front pages of next morning's dailies. Investigation shows that there are 20,000 vaults in St. Louis, each one a source of disease-breeding germs. They are known to be one of the principal propagating sources of flies and many cities have already abolished them.

The cost of eliminating the vaults will be approximately \$75 each, or \$1,500,000 for the entire lot. The bill provides for the displacement of 4,000 vaults each year, so that there will be no financial hardships upon owners.

The milk-supply ordinance is intended to give the city greater control over the milk supply, and to provide more adequate means of inspection. The civic organizations declare that the milk furnished St. Louis is notoriously bad, reaching this conclusion from reports of the Board of Health and the state pure food commissioner. To provide for the adequate inspection of dairies, the ordinance creates the office of chief milk inspector with thirteen deputies.

The demand for proper heating and ventilation of street-cars is based upon the fact that these are the most congested spaces in which people congregate. Foul air spreads disease. The bill provides that the air in the cars must be changed six times an hour by an efficient system of ventilation and that the air coming through the inlets must be of a temperature of at least 60 degrees. It requires a temperature of not less than 55 degrees in cars at all times.

#### STATE SUBSIDIES IN PENNSYLVANIA

Constructive recommendations for the abolition of state aid to charitable and correctional institutions, purely local in character and under private management, were made at the Pennsylvania Conference of Charities and Correction which met recently in Wilkes-Barre. Papers and discussion alike deprecated the extent to which state subsidy had been abused in Pennsylvania and urged the need for reform.

This was the most pronounced symptom of a general feeling that the present State Board of Charities can not hope to be effective as long as its powers are merely advisory. The demand was for more state supervision over charitable and correctional institutions having a state-wide function, particularly over children's agencies.

A report on the question of state aid showed that at the last session of the legislature more than \$16,000,000 had been appropriated in sub-

sidies to charitable and correctional institutions. Nearly half of this amount was distributed among 273 agencies under private management, 263 of which were local in sphere and received more than \$6,000,000. These appropriations were not made on a per capita basis. One hospital under private management was shown to have obtained a larger subsidy than the Eastern Penitentiary, one of the two state prisons, which has on an average 1,400 convicts. Another speaker declared that the annual report of a certain institution receiving state aid showed a surplus over its current expenses of \$43,000.

Fault was found also with the method of passing an appropriation bill in excess of the money available and then allowing the governor to reduce the individual subsidies as it seemed to him necessary. It was thought unfortunate that neither the governor nor the legislature should pay any attention to the recommendations of the State Board of Charities in regard to appropriations.

To remedy this situation the suggestion was made that all correctional and charitable institutions be divided into three classes: those operated by the state; those privately managed but having a state-wide sphere, as for example children's aid societies; and those under private management and local in character—hospitals, children's homes and the like. The recommendations were that none of these agencies should receive subsidies except at the suggestion of the State Board of Charities. State managed institutions should receive first consideration. Their executives should submit budgets to the board, which ought then to prepare a special appropriation bill.

To the second class of agencies it was recommended that subsidies be granted only for maintenance and only upon the condition that the state be adequately represented on the boards of management. A sliding scale of decreasing payments was advocated for local institutions. This scale should be so arranged as to end state subsidy of this nature by 1920. Such subsidy could be gradually replaced where necessary by municipal or county support.

In this connection belongs the recommendation by the conference section on the care of normal dependent children that the state issue yearly licenses to children's aid societies and other placing-out agencies. There was also a call for an investigation of the whole field of children's work and children's institutions in Pennsylvania by a commission employing a traveling executive. The hope was that such a commission would eventually develop into a state board of children's guardians such as the one in New Jersey.

To help in the carrying out of these various recommendations a number of delegates to the conference urged at a special meeting the inauguration of a state charities aid association.

A committee was appointed to inquire into the feasibility of establishing such an organization and, if conditions should prove favorable, to put one into the field as soon as possible.

Among various laws proposed was one calling for the establishment of county hospitals for tuberculosis. This reads that upon petition of a number of the voters of a given county the proposal for the building of a tuberculosis hospital can be placed upon the ballot and voted upon at a special or regular election.

#### PART TIME SHACKLES FOR PRISONERS' LEGS

One of the plague spots of Birmingham, Ala., has been removed. A new city jail has been erected, where now in clean, sanitary quarters are housed the prisoners who formerly lived in the midst of vermin and disease germs. The movement to get a new jail was started five years ago but died from public apathy. Citizens of Birmingham regard the revival and successful completion of the undertaking as due in large part to the effectiveness of their new commission form of government, aided by the aggressive enthusiasm of the state prison inspector, W. H. Oates.

One of the reforms instituted at the new jail is the unshackling of the prisoners' legs at night—the manacles still being kept on during daytime.

#### A PENSION PLAN FOR 175,000 EMPLOYEES

The \$10,000,000 fund that has been set aside for the 175,000 employees of the American Telegraph and Telephone Company, the Western Union, the Western Electric and associated companies, will provide one of the most liberal of the voluntary compensation and pension plans now in existence. Male employees twenty years in the service may retire at sixty years of age or they may be retired at fifty-five, after twenty-five years of service, at the option of the company. The pension age of female employees is five years less than that of male. The amount of the pension will depend upon the previous pay received, but in no case will it be less than \$20 a month.

Accident benefits for either temporary or total disability will be full pay for thirteen weeks and then half pay for the remainder of total disability, or until the employe is able to earn his livelihood, up to the limit of six years. Sick benefits, graded according to length of service, are provided. In case of death from accident three years' wages up to \$5,000 will be paid. In case of death from sickness the benefit will be either one year's or a half year's wages according to length of service, up to \$2,000. Where the benefits provided in state laws are more liberal, those benefits will be paid and in case of accident, if the legal liability is in excess of that offered under the plan, the employe may at his option elect to receive legal damages.

## COLLEGE STUDENTS AND SOCIAL SERVICE

Students of the Massachusetts Agricultural College at Amherst have resumed for the winter their social service in the nearby communities in the Connecticut valley and the hills beyond. That the college has put so much energetic wisdom into extension work the result of which is not immediately commercial is in the minds of many people typical of the institution. It is declared to have successfully injected a religious and social spirit into agronomy and animal husbandry.

The method is simple. Regular students, endowed with an aggressive but tactful spirit of neighborliness go to small towns, there they coach athletic teams and teach clean living and true sportsmanship to boys. Foreigners are taught English and, later, civil government. They hold religious services of a virile and unaffected sort, organize debating societies, give musical entertainments, and supervise agricultural contests.

One of the strongest elements in this activity is the team work developed by the members of the groups of four or five students in their three-day campaigns in the small towns. The usual plan is for the group to visit the schools on Friday afternoon, lead a meeting that evening, hold a town athletic meet on the village common next day, and give a concert and entertainment Saturday evening. On Sunday morning the students speak in the churches of the town, and conduct a mass meeting for men and boys in the afternoon.

Such work as this calls for men of versatile talents and ability. While the work is good for the communities into which these teams go, the greater benefit, possibly, is that rendered to the members of the teams themselves. They freely give their time and effort, and they receive a laboratory training in the religion of service which means as much to them as the technical education they receive at Amherst.

One of the greatest benefits of this activity has been its aid in bringing to a head the belief that every community should have a definite policy, if not a program, involving co-operation in such fields as education, religion, recreation, sanitation, communication, transportation and town beautification. So insistent has been the demand upon the extension service of Amherst college for help in outlining such a policy that E. L. Morgan, of the University of Wisconsin, has been made community field agent to meet this need. Mr. Morgan will assist communities in the investigation of social, economic, and educational conditions and in the organization of forces to improve them.

Corresponding urban work is being resumed by other colleges. Its surprising growth in the

last few years is shown by the fact that in Massachusetts and Rhode Island alone over a thousand students have in each of the past two years voluntarily rendered effective community service of one type or another.

### ROUTING THE SEGREGATIONISTS IN CHICAGO

GRAHAM TAYLOR

The country-wide battle against segregation of commercialized vice, at the discretion of the police, has had no more conspicuous setting nor more significant array of contestants than at the public hearings recently held by the special committee of the Chicago City Council. It will be remembered<sup>1</sup> that this committee was appointed by resolution to investigate vice conditions and to recommend "elimination, segregation or otherwise," just as if the Vice Commission, appointed under the previous administration, had not rendered an exhaustive report and a series of recommendations which cost \$20,000 and a year's work of thirty of Chicago's busiest, best-known, most capable and most representative citizens. However suspicious this circumstance may have been, the committee of nine aldermen gave no indication that they were previously committed to any policy which they might be expected to recommend. For publicly and by personal invitation they invited persons holding any and all points of view to present their opinions at the hearings. And as they did so, the committee gave the fairest, freest and most patient hearing to all sides.

The large council chamber in the new City Hall was thronged by remarkably representative groups. Not only were the specialized agencies and the "special interests," directly involved in the vice war, represented by their executive officers, attorneys and influential backers, but there were present some of the most distinguished men and women, representing by their speech or silent presence the Roman Catholic, Jewish and Protestant churches, the philanthropic and civic societies, universities and professional schools, medical and legal professions, business, social and labor circles. Some unnamed, but not unknown, special interests had representatives conspicuously present and prominently placed on the program of each session. Unlike those who opposed segregation, these "dark horse" advocates of the *status quo* absolutely refused to name those whom they claimed to represent, except by the title of organizations hitherto unknown, or by designating certain lines

<sup>1</sup>See THE SURVEY, October 26, 1912. Fighting Vice in Chicago.

of goods which some of them sold in the red-light district.

The battle royal was on in deadly earnest from the opening of the first session to the dramatic close of the last one, but from start to finish it was overwhelmingly one-sided. One of the sessions was in charge of Clifford G. Roe, attorney for the American Vigilance Association. Another was managed by Jane Addams for the Woman's City Club and was notable both for those who participated and for the profound effect they produced. Mrs. Joseph T. Bowen, representing the Juvenile Protective Association, charged that the city became a procurer by maintaining a segregated district in contravention of the state law. Maud Miner, from her experience in the probation work of the New York courts, plead effectively for better treatment of the women victims and for public agencies better adapted to assure it. Virginia Brooks described the transformation in West Hammond from the demoralization attending many years of the segregation policy to the new idea of the city itself, which came with the success of her two years' struggle to overthrow the political and police administration which was in collusion with vice.

From a loose-leaf ledger of a minor disorderly resort, the attorney for the Committee of Fifteen, which is a group of strong business and professional men organized to prosecute panders, proved that the proportion of the receipts paid for protection averaged \$210.51 a week. He estimated on this basis that all the resorts of this district which contained 1,200 women, would aggregate \$2,000,000 a year paid for protection, and yet that each inmate was kept in debt to the keeper in twenty-eight out of thirty individual instances. Father P. J. O'Callaghan, speaking for the church of the Paulist Fathers, demanded segregation for men if required for women, and protested against applying the title "His Honor" to the mayor if by a policy of segregation the chief executive of the city was also constituted its "chief panderer." Rabbi Hirsch with great force argued that if the Russian police could not withstand the temptations to graft in segregating Jews, innocent of any offense other than that of their race and religion, the American people could not escape demoralization under the far worse temptation to sell their discretionary power over the illicit trade in vice. "Not as a fanatic but as a citizen," he cried, "away with this segregation of vice slavery which is not reproduced in the mines of Siberia." Jenkin Lloyd Jones charged that the lust of the dollar or the vote was the only argument for restoring the disorderly resorts to the red-light district, which the state's attorney had suppressed.

The arguments for segregation were extremely weak. Even those that were put forward

by physicians were such as might have been urged with more plausibility twenty-five or fifty years ago, before the diseases of vice and the dangers of infection were known as they now are. A police captain's son read approvals of the policy of segregation from police chiefs in fifteen cities, despite the previous demonstration of the fact that the police have special financial interests, which are regarded almost as vested rights, in the policy of segregation. A liquor dealer had the temerity to assert that there was a larger trade in soft drinks, like ginger ale and soda-water, than in hard liquor and in beer among the disorderly resorts. In rejoinder, a resort keeper's ledger was cited to prove that there was an annual sale of 7,269,000 bottles of beer in the resorts of this one district, at three or four times the price charged for it elsewhere.

But the climax of this game of bluff came at the very close of the hearing. A man hitherto unknown had made a "grand stand play" as the representative of what he was pleased to call "the Chicago Protective League for Women." When challenged to produce the names of its members, or to name its financial backers, as all the other representatives had done, he absolutely refused to do so. Meanwhile, he claimed to have made, with the assistance of the police, which demonstrated the need of segregation, an investigation of conditions in the segregated district. It was based upon the life stories of 1,160 women who he said had been made to believe that they had to register at the office of his "league." He admitted that the inmates of all but four of the houses had yielded to this "bluff"—his own and that of the police. His lawyer had noisily challenged any one to show that his client ever had any connection with the interests invested in the segregated district. At last his own bluff was called.

The chairman of the Committee of Fifteen was recognized as the last speaker at the final hearing. He asked for the privilege of producing documentary evidence to invalidate the claims of the former speaker. Then a note for \$100 was produced, signed by this "protector" of women, made payable to the order of one of the most notorious vice kings then on trial before the Municipal Court and since convicted. When the note was read and its signature was declared to be genuine by a handwriting expert, confederates of the entrapped man scurried together. One of them shouted "forgery." The chairman offered opportunity for explanation. The gentleman aggrieved feebly responded that it would be made "at the proper time and place." The gavel fell. The public hearings ended. The committee went into executive session.

Pending the report and recommendations of the committee there has been a surprising rally of public sympathy against restoring the sup-

pressed disorderly resorts in the former segregated district. All the great dailies have already pronounced against it. The *Daily News* strongly cautions the committee against ignoring the illegality of a return to the former policy, and asks

"What agencies want the lawless dives restored to the city and turned over once more to the supervision of the police? Does public opinion desire it? No. The closing of the segregated district thus far has created no serious problem for this community. On the other hand, it has locked the terrible doors through which unprotected girls, by thousands every year, are lured to slavery and early death."

The *Tribune* urges "Let us go forward, not back, and let us be sure which way we are going." It declares that "the reopening of this district, or any similar district, should not be considered by the authorities for a moment at this time," and adds "now that we are tardily facing this dark question, the conscience and the intelligence of the community demand that it be dealt with not superficially and cynically, but courageously, scientifically and with effect." For the data and conclusions upon which the best policy for Chicago can be worked out, the *Tribune* refers the council committee to the reports of the Vice Commission and of the Committee of Fifteen of New York.

The *Record-Herald* "without much hesitation, associates itself with those enlightened and humane men and women who oppose segregation and advocate rational, gradual repression of the social evil." After roundly asserting the failure, illegality and demoralization of segregation, it urges a report against it and the enforcement of the policies recommended by the Vice Commission, together with additional constructive work in the line of education, prevention and reclamation. "A report against segregation," it declares, "would be a call to service and helpful activity. A report for segregation would be a victory for ignorance, inefficiency and reaction."

The most far-reaching result of these public hearings thus far achieved is the permanently organized federation of all the agencies directly or more indirectly involved. Thirty-three of them, including the educational, rescue, prosecuting, legal, medical and religious groups, have already allied themselves to make common cause, under one plan of campaign, directed by a steering committee, and led by A. W. Harris, president of Northwestern University, and by Walter T. Sumner, chairman of the Vice Commission, as chairman and vice-chairman of the new federation. Notice is thus served of a declaration of war without discharge, which will certainly cause the politicians and the police, the mayor and the city administration, the state's attorney and the judges to reckon

with an organized public opinion such as they have never met before either in the performance or the evasion of their duties. But even better than that, the whole situation promises the assurance of an enlightened, constructive, progressive public policy for carrying on and out the clarion summons of the Vice Commission: "Constant and persistent repression of prostitution the immediate method; absolute annihilation the ultimate ideal"; with the appointment of a morals commission and the establishment of a morals court as the means to those ends.

Meanwhile the report of the City Council committee and its recommendations will be received with interest, and the more so because one of its members seriously asserts, what all his colleagues are now certainly aware of: "The darned thing is loaded at both ends."

## HARD TIMES FOR THE LOAN SHARKS

ARTHUR H. HAM

The loan sharks in New York are facing a distressing situation. Advised by eminent counsel that their schemes for evading the statutes were proof against attack; firmly entrenched with long leases in reputable office buildings; their alluring and misleading advertisements gladly accepted by powerful newspapers; using the courts and the attitude of short-sighted employers as effective instruments in enforcing their outrageous demands, they have for years reaped an abundant harvest of dollars wrung from unfortunate victims. In no city has so much effort been made to check their extortionate practices as in New York, and it is apparent that the effort is now bringing results, for the situation is undergoing a marked change.

The courts recently have ruled that the laws of the state render any person who exacts more than the legal rate of interest on salary or chattel loans liable to fine and imprisonment; that such laws are constitutional; that a greater charge than the legal rate of interest may not be covered by exacting attorney's fees, commissions or by any other device or pretext; that a judgment obtained by confession on a usurious loan may be reopened and reversed with costs imposed on the lender; that usurious loans are void as to both principal and interest and if usury has actually been paid the borrower may recover twice the excess paid in all transactions within a period of two years.

To make matters worse many employers have discontinued their practices of discharging men who have borrowed and are refusing to recognize illegal assignments of wages. Owners of office buildings are evicting their loan shark tenants, and with the exception of the *World*

the daily papers are refusing to print their advertisements.

The district attorney has established a usury bureau under the charge of Franklin Brooks who, as the result of complaints received, has raided many offices and carried off to court proprietors, safes, books and papers in common patrol wagons—it used to be the custom for the loan shark to ride to court in his limousine accompanied by his secretary and counsel. Sixteen of the elect have been held by the magistrates for trial by the Court of Special Sessions during this month, and although they are represented by able attorneys some of whom are influential members of the legislature and high in party councils, it is thought that they can not be saved from real punishment for their insatiable greed and lawless practices.

Strangest of all to relate, the despairing, cringing borrowers have been reading the newspapers and have sought advice from those who have been studying the problem. Men who signed notes, assignments, confessions of judgment, powers of attorney and chattel mortgages in blank without daring to inquire their nature, who have paid interest at 300 and 500 per cent per annum only to find the original debt had increased, who have borrowed from one loan shark to pay another and have been overwhelmingly grateful for a few days' extension on their monotonous payments now have the temerity to notify their task masters that they will pay no more, daring them to proceed against them.

This anomalous state of affairs has caused consternation in the loan shark camp. Many offices have been closed, some are refusing to make loans even to old customers while the majority are quite willing to discount their outstanding claims when offered principal and legal interest. Those who thrive on the adversities of others are themselves getting a touch of hard times.

It is hoped that the district attorney will not be satisfied with a good beginning but will continue his efforts until his part in the campaign has been fully done.

It has been observed frequently that there exists a well-defined demand for small loans to deserving people. It must be said therefore that no amount of publicity or enforcement will bring results of permanent value unless deserving borrowers are afforded adequate facilities for obtaining loans at reasonable rates. In the pawn-broking and chattel loan fields excellent work is being done in New York by the Provident Loan Society, St. Bartholomew's Loan Association and the Chattel Loan Society. The work of these societies must be supplemented by a further investment of honest capital on a reasonable money-making basis and by the organization of

co-operative credit associations among employees.

## THE INDIVIDUAL AND THE FAMILY<sup>1</sup>

ALEXANDER JOHNSON

It is coming to be universally understood that the great work of the associated charities in our cities is not the mere relief of distress, important though that is, but the rehabilitation of family life. More and more we are coming to see that the social unit is not the man or the woman, but the family. More and more we are acting upon our often expressed opinion that the foundation of a prosperous state is family life.

Now we are just beginning to realize that the same principles hold true in institutional work. That when we take an inmate into a reform school, a hospital for the insane, even an almshouse, that inmate is rarely alone in the world. Back of him and connected with him is a family. His condition, which makes necessary the state's or the county's institutional provision, is related in some way to things that have happened with the family that is outside.

Take two particular examples which are constantly occurring: Here is a married woman, mother of a family, who at the age of forty becomes insane. The causes of her insanity are frequently overwork, overanxiety, malnutrition, bad housing—all things which belong to family life. We take her to the hospital for the insane; there we give her every possible care; we spend upon her from five to seven dollars per week, and, in some states, much more. After six months or perhaps a year, or it may be longer, she recovers. She becomes convalescent and she is discharged and goes back, nine times out of ten, to the identical conditions which caused her insanity in the first instance, with the result that it is only a few weeks or months before she is again insane, again a subject for the hospital.

Or take another case. A boy, wayward, so-called incorrigible, is brought to the juvenile court. The judge, guided by the information secured by the probation officer, discovers that the boy himself is not entirely, perhaps not chiefly, to blame; home conditions are often the cause of his waywardness; lack of parental discipline and guidance; associations, forced upon him by the location of the home, which are corrupting. The judge realizes that his so-called home is no fit place, and having no other available home, he commits him to a juvenile reformatory. There the boy does fairly well for a few months, the superintendent feels he might go out on parole, and he is sent back to the very home

<sup>1</sup>An address delivered recently before the Illinois Conference of Charities and Correction.

and the very conditions which caused his waywardness in the first instance.

Now, it will be seen that in both these cases, numerous examples of which might be found in every state, the weak point of the arrangement is the lack of knowledge of the family relationships. The insane woman or the wayward boy are treated as social units, and the family of which they are part is disregarded.

What should be done in cases of this kind? That is best answered by what is being done in some states and cities. With regard to the insane, what is called after-care has been created. That means that before the convalescent patient leaves the hospital, his home conditions are looked into by a wise and careful agent. If they are not such as will conduce to the complete establishment of his sanity, efforts are made to change them. Sometimes this means a certain amount of charitable relief; sometimes it means advice and supervision. Until the conditions of the home are made fit for the convalescent person to return to, he is not sent back. That is to say, efforts are made to treat the insanity of the patient as a symptom of a physical or social disease not only of himself, but of the family of which he is a part.

With regard to the wayward boy, the same kind of treatment ensues. Only a little while ago, when an inquiry was made into the management of the Juvenile Court of Chicago, probably the worst thing that was found to exist was that children who had been taken from their homes because, in the opinion of the judge, those homes were not fit places for them, had then been sent to institutions which had very speedily allowed the children to go back to the same bad homes.

What is needed is a clear apprehension of the fact that we must deal with our defectives, our delinquents and our dependents as parts of the families to which they belong. We must associate our work with them; we must be willing to learn from each other to take counsel together, and above all, we must insist on the fullest possible knowledge of the individuals whom we treat, not merely physically and mentally, but also socially.

When an inmate comes to any of our state institutions from a large city in which there is a charity organization society, the chances are that something is known by that organized society about that inmate. Not only should we have the full record from the court, but we should have the social record which is otherwise available.

Then when the time comes for sending out the inmate, co-operation should be established with the social agency of the city or town to which he is going.

Of course, in very small places, the above

does not apply, but even then something can be done. The township trustee or overseer of the poor can be communicated with, or the sheriff or chief of police will be able to give information. If only efforts are made to establish co-operation of the right kind, it can be done, and the state conference of charities is, of all places, the one where such efficient co-operation might be worked out.

---

## THE TREND OF THINGS

---

IT was in January, 1911, that, according to Arthur Tracy Cabot in the *Atlantic Monthly*, the Boston Consumptives' Hospital trustees closed the home-school where children with open communicable tuberculosis were segregated. Says Mr. Cabot:

The chairman of the board, who cast the deciding vote which closed the school, when asked how these patients were to be cared for after the closure of the school, said, "At day-camps and hospitals," and declared that it was the intention of his trustees so to provide for them. Under these circumstances it is interesting to know what became of these patients after they were turned out of the hospital school. Drs. Locke and Murphy made an investigation and were able to trace one hundred and fifty-six out of the one hundred and seventy-four cases treated at the school during the year previous to its closure. Of these cases just nineteen, or 10.91 per cent, went to day-camps or hospitals; ninety-one, or 58.33 per cent, went back into the public schools; four, or 2.56 per cent, had died; and the remaining forty-two patients, or 26.92 per cent, had gone back into the community.

These figures give a striking illustration of the far greater usefulness to the community of a hospital school than of a day-camp or hospital. Only a little more than 10 per cent of the children whose parents are willing to have them attend a hospital school are willing to let them go to day-camps and hospitals. The large proportion of these cases which went back into the public schools, at the risk of infecting well children, is sufficient basis for a serious indictment of the city government that subjects well children, put under its care, to such unnecessary risks.

\* \* \*

EDITH RICKERT presents in the *Century* a study of women's fraternities in America. Miss Rickert concludes nothing less than that these fraternities, notwithstanding individual benefits, "are hastening on our 'French Revolution'; they are creating a type that rules by habit rather than by individual power and wisdom: and by their inflexible system of caste they are emphasizing the gap, already more than sufficient for women as for men, between privilege and the working world."

MABEL POTTER DAGGETT, writing in the *World's Work* on the widow's pension, tells this story:

To an official window in one of the city departments of New York recently came a man leading his little daughter. "I can't get work," he said bitterly. "This child can. They are hungry at home. May she have a permit?"

She was fourteen and met the other requirements of the law. So the City of New York gave her the desired legal document, the "working paper," as the children call it. The man and his daughter went out together, the little girl to join the great army of toilers, where the insistent sign of industry, "Girls Wanted—Boys Wanted," always swings in the wind; the father to swell the ranks of unemployed men.

\* \* \*

MEN WANTED FOR THE UNITED STATES  
ARMY. EASY WORK, GOOD PAY.  
A CHANCE TO SEE THE WORLD.

THIS advertisement is made the basis for the following reflections by two frequenters of the Interpreter's House in the *American*:

I wonder whether Uncle Sam is telling the truth—said the Observer. Let's look that list over a little closer.

Private soldiers .....	\$15 per month
Cooks .....	30 " "
Bandmasters .....	75 " "

He is and he isn't—said the Reporter. He doesn't tell a lie exactly, but he shaves it as close as you'd peel an apple. I know something about a soldier's life. Here's his "steady employment" at fifteen dollars per month. Up at six, has breakfast and makes his bed. Drill at 7:30 for an hour and a half. Then a lot of useless routine duties up to about one. Two months a year target practice and special drill. That's his apprenticeship for three of the best years of his life.

What does he get out of it?—asked the Observer.

Exactly—answered the Reporter. What has he to show for those three years that will help him to be successful as a carpenter, a mechanic or a merchant or anything else that is useful? For three years his mind has been turned away from all of those things whereby he might make a living. He has acquired a habit of idleness and a distaste for civil life. Much of the training and knowledge which he previously had have lapsed from disuse. In their place he has acquired the vices of the camp, but he cannot live on those. If a man were receiving fifteen dollars a month and at the same time

a training that would fit him for something useful, well and good; but at what price can a man agree to throw away his future?

"A chance to see the world." No man sees less of the world that is worth seeing than the private soldier. He sees the inside of forts and brothels. He is not stationed where there is much to see, and what travel he gets does not educate him.

\* \* \*

WILLIAM McANDREW, writing in the *World's Work*, advocates classes in "the magazines." He says:

The atmosphere of a school, the intended training place of future citizens, in a republic, the supposed seminary of independent, self-reliant souls who must do their own thinking, takes on the spirit of a military organization in which efficiency depends upon unquestioning obedience. The use of a magazine of current ideas seems a direct remedy for this defect. Timely problems are unsettled ones; otherwise they would not be current. The exercise of judgment is more easily possible because the ideas are almost as new to the teacher as to the others. Here is a situation where happily the teacher does not know it all. There is brought into school the novel and desirable condition of equality of ignorance. In a magazine class I saw the unusual and delightful spectacle of a teacher listening to recitals of things unknown to her. The topic was the article, "A New Element in Strikes," in the *World's Work* for May, 1912. The discussion had centered around the laws for the restriction of the hours of labor of women and children. Two girls from the East Side, members of whose home circles are in the waist-makers' union, set forth with vividness of detail and earnestness of manner the condition of the trade-working woman more effectively than the best-read teacher could dream of doing. The other girls listened and commented with an intentness that only one teacher in a thousand, treating of textbook history, can secure.

\* \* \*

WALTER V. WOELKE gives this history in *Sunset Magazine* of the Harriman Line Club at X:

The club-house threw open its doors in due time and flung the keys away. Like the saloon, it invited the men to come in at any hour, day or night, and make use of their billiard and pool room, play cards at their tables, read in their library, buy cigars twice as good as the saloon *stincadores* for the same price, make use of the dance hall, the café, the rooms and the baths in any way they saw fit. The men responded slowly to the invitation to come and take possession, so slowly at first that the saloon-keepers' grin deepened and became almost sardonic. By and by, however, the grin congealed on the saloon's fat red face. It froze into an

ugly smirk, vanished altogether, degenerated into a snarl when, a few months after the opening of the club-house, seven drink emporiums closed their doors—for lack of business.

But the saloon did not give up without a fight. It bribed cooks in the club café to place dope in the patrons' food, to make them ill and drive them across the street. It offered free drinks galore. It bought attendants at the club, hoping to disgust the men by poor service. When all other means had failed, it bribed every attendant, every employe of the club-house, and called them out on strike one morning, leaving the quarters empty. One foul blow after another the saloon planted below the club's belt, but to no purpose. The club, not the saloon, survived.

Today the town of X is larger than it was. It has a thousand additional inhabitants, but the number of saloons has decreased from *twenty-nine* to *seven*—for lack of business.

\* \* \*

#### THE WEEK BEFORE CHRISTMAS.

'Twas the week before Christmas, and all through the town

The shopgirls and packers were fast breaking down,

While women of leisure lay soft in their beds,

And visions of purchases danced in their heads.

"I never go into those stores with bad air,

But the time of their closing is not my affair,"

Said a lady who shopped in a limousine car

More roomy and lighter than tenements are.

And then as she dozed, there arose such a clatter,

She rang for a maid to see what was the matter.

She saw to her horror a flying machine

Come down through her chimney. Within it was seen

An angry old Santa Claus, dressed like his picture,

Whose face was her Bishop's and doctor's in mixture.

He threw from his tonneau a muff which could purr;

'Twas labeled "The voice of the sweated in fur."

Kid mules which went tapping about the parquet—

It's 11 o'clock, we're delivering yet!

Each purchaser wants all his parcels each night—

And to-morrow they drive us before the day's light.

A phonograph sang with an opera voice

(In Italian) "'Tis Christmas, let all men rejoice!"

But always the weary must pay when they break,

And we can't keep a girl if she makes a mistake.

One hand on her Bible, and one on a check,

The poor lady listened—a terrified wreck—

While the gifts of her nightmare piled up on the floor,

And that horrid Saint Nicholas handed her more!

When she clutched at her Bible, he pulled off his cap

Saying, "That's what I need for the people you trap

Into working for wages on which they can't live.

It's they who need Scriptures on how to forgoe.

But your mean little checks—\$5 here and \$10 there—

For the sweated you doom to a hospital's care

Are the devil's own credit, it's he alone knows

The lives that are ruined by shops that won't close.

If after long hours, girls reel from a store

More dead than alive, to a friend at the door—

Who offers to treat them, and one more goes under—

'Tis you are to blame, with your bargains and blunder.

You patronize shops which are open at night,

Then you open a Rescue and think it's all right.

I tell you conditions don't change for committees—

It will take every woman in each of your cities;

Good hours! good wages! a small dividend

To the octopus owners—then world without end.

Just then came the voices of children at prayers—

"Dear Santa Claus, please send my mother car fares,  
She cannot work late and be walking home, too,"

When away to his children the Santa Clause flew.

MARGARET CHANLER ALDRICH.

\* \* \*

WE have something to learn about reasonable living, it seems, from Darkest Africa. Booker T. Washington tells in the *Century* of an African student who came to study at Tuskegee.

"He did not," says he, "approve at all of our course of study. There was not enough theology, and too much work to suit him. As far as he was concerned, he could not see any value in learning to work, and he thought it was a pretty poor sort of country in which the people had to devote so much time to labor. 'In my country,' he said, 'everything grows of itself. We do not have to work. We can devote all our time to the larger life.'"

\* \* \*

HUGH H. LUSK in the *Forum* advocates a labor copartnership law, and characterizes it as "a law that is founded on the radical truth that labor in all trades is of necessity the partner of capital embarked in those trades, and provides that the partnership shall be acknowledged and acted on by a sharing of profits." Such a law would, in his opinion, in contrast to arbitration legislation, have the "valuable quality of permanency as well as the sanction of justice."

### POLYGAMY AND THE EUGENIC PROGRAM

TO THE EDITOR:

IN THE SURVEY of November 2 Dr. Ira S. Wile in his excellent report of the recent Hygiene Congress in Washington states that I there advocated polygamy as a remedy for defectiveness and degeneracy. People who know me personally will not need to be told that I never advocated polygamy, nor euthanasia, nor the Neo-Malthusian Society's proposals for the prevention of conception by artificial means, nor *laissez faire*, nor any practice subversive of our highest standards of morality. All of these I mentioned merely as having been proposed along with other possible and impossible measures, as means for the prevention of these evil conditions which so burden and afflict society. In fact, I advocated no measure whatever, nor did I give reasons for or against any. I distinctly stated that as yet there is not enough data accumulated to warrant conclusions or

recommendations for a preventive eugenic program.

This mere mention of the word polygamy was seized upon by a Washington newspaper reporter and made a sensational feature of its report of the meeting, and from that source doubtless it has spread to many quarters. I trust that you will do me the justice to give this statement as wide publicity as has been given to that which I venture to believe Dr. Wile received, not at first hand but through newspaper sources.

BLEECKER VAN WAGENEN.

New York.

#### PRISON LABOR IN NEW JERSEY

TO THE EDITOR:

IN THE SURVEY for November 2 there is an advertisement by Mr. Walsh of the Committee on Social Service (presumably, of the Democratic Campaign Committee) reading partly as follows: "The following are some of the laws passed by New Jersey during the term of Governor Wilson: a law abolishing contract labor by inmates of prisons; providing that as many of such inmates as possible be employed in agricultural pursuits, and in horticulture and floriculture, and when not so occupied such inmates to be employed in the manufacture or production of goods and articles used by state, county and municipal departments and institutions. This law struck down the iniquitous contract labor system and unfair competition between prison and free labor with one blow."

Now what are the facts? It is true that the law was passed. But it is a dead letter. There has not been one particle of reform or change in prison labor conditions in New Jersey since the law was passed. There is not a single convict employed in the various ways suggested in the statute. In fact, there are about one hundred more convicts employed under the contract system than before the enactment of the statute.

One of the provisions called for the appointment of a commission to install methods of employment to take the place of the contract system. Governor Wilson appointed the following on this commission: S. W. Kirkbride, William H. Tonking, Joseph P. O. Lows, Cook Conkling, Richard N. More and George M. Lamont.

In making these appointments, the governor either showed very little sagacity or else to be slangy, let his advisers "put one over" on him. The contractors could not have wanted anything better. The commission is dominated by Mr. Kirkbride who had always fought the abolition of the contract system and had lobbied in Washington against legislation inimical to the contract system. The result has been that for the year and a half of its existence, the commission has absolutely nothing to show. It has simply been marking time. Since it does nothing constructive and the convicts cannot be left in idleness, the old system keeps merrily on. The game of the contractors and the commission is to hold off till a complaisant legislature can be gotten to repeal the law abolishing the contract

system. The only thing done by the commission is to inspire occasional press items in opposition to any form of labor except the contract system and to yearn for legislation repealing the enactment of 1911 and ending the life of the commission.

I do not for a moment doubt Mr. Wilson's sincerity in the matter but the statement of Mr. Walsh that the law "struck down the contract system and unfair competition between prison and free labor with one blow" is just one delicious bit of pure campaign buncombe designed to gull those who are not aware of the facts.

As to what Mr. Walsh says of a workmen's compensation act, that is a white horse of another color.

New York.

WILLIAM PHILLIPS.

TO THE EDITOR:

You have called my attention to the letter of Mr. Phillips concerning prison labor in New Jersey. The so-called Osborne Bill, passed in 1910, abolished contract labor in New Jersey. The contracts then in operation at the state prison had between three and four years to run. The act did not cancel these contracts, and it was not the intention of the framers of the bill that it should do so. The object of the legislation was to give time for the state to readjust prison industries to the "state use" system so that as the contracts expired the prisoners released from the contracts should find immediate employment under the new system. The legislature of 1912 reorganized the commission as provided for in the original act, and took the appointments out of the hands of the governor and placed them in the hands of the legislature. The original act provided for a commission of five to include two appointive members, the superintendent of the state reformatory, the warden of the state prison, and the commissioner of charities and corrections. The present commission is composed of six members appointed by the legislature in joint assembly in April last.

The legislature made no appropriation for the commission to enable it to carry on the necessary preliminary work of investigation and organization. The commission has had a number of meetings which have been attended at their own expense. The members have, without exception, assumed an earnest and intelligent attitude toward the duties placed upon them. Four of the members have within the past three weeks made a tour of a number of institutions outside of New Jersey for the purpose of acquiring at first hand all available information concerning the employment of prisoners on the state use system, and four of its members were present during the recent congress of the American Prison Association in Baltimore. All this has been done at their individual expense.

Mr. Phillips's prophecy is premature and his criticism unfair. His statements seem to be based upon misinformation or a disregard of facts. No one familiar with the personnel of the commission is likely to believe the statement that they are dominated by the chairman.

The commission has not been in existence a year and a half. They were not appointed until the latter part of April, 1912, and did not organize for at least four months after their appointment, and for this failure to organize earlier the commission was not responsible.

I am sending you this statement in order that Mr. Phillips and those who may read his letter, may be set right.

JOSEPH P. BYERS.

[Commissioner of Charities and Corrections.]

Trenton, N. J.

## "MURDER IN THE FIRST DEGREE"

TO THE EDITOR:

I have just finished your editorial "Murder in the First Degree" with some disappointment. It seemed to me not to go deep enough.

May I assume that the houses of gambling and prostitution in New York have 40,000 patrons? Then let us say 40,000 men voters in New York desire gambling resorts and houses of prostitution. They mean to have them. They vote for people in public office who will see to it that they *do* have them. And to my mind, it is they who were responsible for Herman Rosenthal's death.

How about the rest of the voters in New York? Leaving out the handful of men who are paid to fight vice and degradation, the remainder take this attitude—they say, "While we couldn't take the responsibility and the odium of arranging for and licensing gambling resorts and houses of prostitution, of course the men who want them can have them and will have them. The only thing for us to do is to look the other way. Indulgence of that sort can never be wiped out entirely. Imagine a big city without gambling and prostitution."

Now, may I ask, why aren't there people even more responsible for Rosenthal's murder? New York voters do not want or expect the police to wipe out gambling and prostitution from every nook and corner of the city. Neither do they want to legalize gambling and prostitution by the giving of licenses.

They merely want the police to keep vice out of sight a bit, to attack the spots that fester worst, to pretend that they are doing something for their salaries. *But they don't want it done.* Isn't it a bit absurd to pretend to be shocked over the details of the Becker case? Do the men of New York really expect a police force to connive with crime sufficiently to ensure the maintenance of disreputable resorts, and by so doing, risk losing their positions, their reputations, their very lives? Apparently they do. And at the same time they expect their police to be men of such honor and integrity as to scornfully refuse the perquisites which come their way while conniving with crime. It's a good deal to expect. To my mind the blame not only of the Rosenthal murder, but of countless murders and crimes, rests not so much on the police as on the men voters of New York who do not dare to license and who do not care to suppress gambling resorts and houses of prostitution.

New York.

## CONDITIONS AT MUSCATINE

TO THE EDITOR:

The contribution of Harry F. Ward in your issue of June 1, regarding conditions at Muscatine, Iowa, is in substance an indictment of the community at large. It is also slanderous to citizens of Muscatine because untruthful in many of its statements concerning them. Let me cite a few examples: "It (the community) has grown up in sprawling, haphazard fashion; it has not even a paid fire department." The ordinary reader would understand this to mean that Muscatine has no fire department whatever, when in truth it has had for many years a very efficient volunteer department, which has won more premiums than any other department in contests at state tournaments. Again Mr. Ward says: "There is no community consciousness"; "it forms its judgment on prejudice"; "is bewildered because of its ignorance and bitter because of its prejudices." Again, he says: "The forces of law and order are not effective and brutally unjust," etc.

What can be the "consciousness" of a man who goes into a community where a reign of terror has been inaugurated by a group of workers who, having abandoned their jobs, are making use of violence to prevent others from working—such violence as throwing stones, sticks and mud at inoffensive girls, hurling stink bombs in the night into dwellings of these workers and, in one instance, poisoning one of their wells? What, I say, can be the "consciousness" of a man who, seeing this kind of outlawry, forms his "judgment on prejudice" and straightway scandalizes those who are seeking to restore order as "bewildered because of ignorance and bitter because of prejudice?"

There was no question for settlement before the community when Ward made his so-called investigation except that of putting a stop to assaults upon the lives and liberties of peaceable men and women who wanted to work for the wages offered them, and yet because of efforts of the constituted authorities to protect these innocent people, these authorities are assailed in a paper, especially devoted to social justice, as "ineffective" and "brutally unjust," unaccompanied by a single word of condemnation of those who unlawfully attempted to accomplish their purposes. Ward further says: "Muscatine stands bewildered, incoherent, impotent." No such thing. It is a prosperous city. Its factories are running, notwithstanding the "brutal" efforts of certain persons to stop them. Moreover, the Methodist Church (one of those maligned by Ward as having "failed" of duty in the late labor troubles) dedicated a new \$112,000 church last month without a dollar of indebtedness on it.

Mr. Batten's article in the same issue of THE SURVEY gives some real information and is more fair than is Ward's. However, Batten is unjust to Muscatine in attempting to show that it has an "inheritance of roughness" by saying that in early times it had a gang called "Mad Creek Rattlers," who, he gravely declares, were

"always ready to commit any crime up to and including murder." I was a boy in Muscatine at that time and can certify that the "rattlers" referred to were wholly inoffensive. This was an organization of boys to oppose in friendly combats a like organization in another part of the town, and no act of violence was ever chargeable to either organization. It is no wonder that Mr. Batten and Mr. Ward have arrived at some unwarranted conclusions after giving heed to such "old wives fables" as that relating to the "Mad Creek Rattlers."

Evanston, Ill.

JOHN MAHIN.

[Readers of Mr. Mahin's letter should know that the writer is a man of advanced age who has not lived in Muscatine for ten years and whose knowledge of the situation has come to him from partisan sources or from newspapers which were denied access to important facts.

The "so-called investigation" was not made by one man, but by a committee, whose report has been adopted by the Commission on Social Service of the Federal Council of Churches which appointed them.

The courts have not sustained Mr. Mahin's contentions concerning the acts of the strikers, but have sustained the report of the committee concerning the "forces of law and order."

The fact that a church costing \$112,000 could be built and paid for during an industrial conflict of eighteen months' duration in the leading industry of the town, involving the unemployment of a large proportion of its workers, may partially explain the statements of the committee concerning church life in Muscatine.—Ed.]

#### 'THE GAME OF LAW'

TO THE EDITOR:

I read with much interest Mr. Wessel's article, *The Game of Law*.<sup>1</sup> Mr. Wessel's criticisms on the administration of justice in some of the states of this union are just. But in order to form a correct opinion on the subject it should be noted that each state in the union has a judicial system of its own. In some of the states the technical points, which Mr. Wessel criticizes, have little weight. In the New England states generally, in New York, New Jersey, Ohio, Illinois, Wisconsin and Kansas and by constitutional amendment in California, it has been provided that no judgment shall be reversed or new trial granted because of technical errors which do not affect the merits. Or, to use the language of Judge Cox, delivering the opinion of the Circuit Court of Appeals in *Press Publishing Co. vs. Monteith*, 183 Fed., 357: "The more rational and enlightened view is that in order to justify reversal the court must be able to conclude that the error is so substantial as to affect injuriously the appellant's rights."

The Supreme Court of the United States in its new equity rules (19) provides: "The court at every stage of the proceedings must disregard every error or defect in the proceedings which does not affect the substantial rights of the parties."

Mr. Wessel calls attention to the delay which sometimes takes place in criminal trials in the United States and particularly to that in the trial of Tucker for the murder of Mabel Page. Allow me to say that I have been engaged as a member of law reform committees for a good many years in promoting the work of reform in the administration of criminal justice, and that I have uniformly found the greatest difficulty to arise from the spirit expressed in the article of Mary Brown Sumner in the same number of your valuable periodical as that containing Mr. Wessel's article. I have no doubt that Giovannitti finds it very uncomfortable to be in jail. But he ought to have thought of that before he committed the crime of which he is charged. Perhaps Miss Sumner would say he is not guilty. But that is the question to be determined by the jury. Certainly people were killed during the Lawrence strike. It is in the interest of innocent, hard-working people that the persons responsible for that killing should be brought to justice. If Giovannitti was not guilty, he was certainly found in very bad company. His friend and associate Haywood was guilty of a murder in Wyoming if we may believe the testimony of his accomplice. Under our system of law he was not convicted of that crime, because in its tenderness for the culprit it forbids a conviction upon the sole testimony of an accomplice. But no one who read the testimony on the trial can have any real doubt of Haywood's guilt. It did not convince the jury beyond a reasonable doubt. On that basis the very merciful law of this country proceeds in dealing with alleged criminals. In such a case the verdict may save a man from prison or from the gallows, but it ought not to reinstate him in the confidence of the community.

EVERETT P. WHEELER.

New York.

#### THE LAWRENCE RECALL ELECTION

TO THE EDITOR:

On page 53 of *THE SURVEY* of October 12, one reads that when "the English-speaking community at Lawrence had a chance to express themselves in the special election for school committeemen," John J. Breen, "who had confessed to planting dynamite to destroy the strikers," was "overwhelmingly defeated." In view of the circumstances it seems that this is hardly an accurate description of the fact. That a man, tried and convicted of a peculiarly vicious offense, should poll a vote of more than 2,200 out of a total of about 6,000 votes is surely cause for considerable astonishment. It is a matter of regret that the citizens of Lawrence—"the English speaking community" which is supposed to represent the defense of the forces of law and order in the present situation—should have left any uncertainty in their condemnation of John J. Breen. That thirty-seven out of every one hundred voting citizens of Lawrence should have expressed a willingness to allow this man to remain a member of their school board does not appear exactly like an "overwhelming de-

<sup>1</sup>See *THE SURVEY*, November 2, 1912, p. 138.

feat." Perhaps, as the Boston *Herald* suggested, "the vote affords some explanation of the conditions which have obtained there."

Boston.

EMILIE J. HUTCHINSON.

#### ARTURO GIOVANNITTI

TO THE EDITOR:

I have read with great interest the brief article, in *THE SURVEY* for November 2, on Arturo Giovannitti. It is of peculiar interest to one who is himself a graduate of a Protestant theological seminary, and who is having his own struggle trying to make what he learned there fit in with new scientific habits of thought and social ideals, to learn that Giovannitti himself once began preparations for the Protestant ministry.

New York.

A. J. MUSTE.

TO THE EDITOR:

Permit me to thank you for the article on Giovannitti. I am no weak sentimentalist but merely a fair-minded woman, wishing to see justice done. Amid all the wild, indiscriminate denunciations of "capitalists," it is well to see an informing and suggestive article like the one referred to. How hard it is for the oft-times cold Anglo-Saxon temperament to appreciate or understand the Latin. How almost impossible it is for us, lacking, as we are, in imagination, to put ourselves in another's place before passing snapshot judgment on his case! Charles Reade's immortal maxim, "Put yourself in his place," was never more needed than in this age of unrest and imperative readjustments.

ANNIE S. CHURCHILL.

Brookline, Mass.

#### A CORRECTION

TO THE EDITOR:

I note that in *THE SURVEY* of October 26, you published under the head of "Communications" the article which I had prepared at your request as part of a symposium<sup>1</sup> of views on workmen's compensation published some time ago. I am very sorry the article was published in this particular form since it would make it appear that I am going out of my way to take part in a controversy now going on in the United States in which I have no direct concern, but which is a matter of life and death to some of your large insurance interests. The article correctly expresses the views which I have urged and which are rapidly gaining ground in the United States but I should not have thought of publishing them in the form in which they appear. I should be glad if you would give this the same publicity as the article itself.

F. W. WEGENAST.

[Counsel, Canadian Manufacturers' Association.]  
Toronto, Canada.

<sup>1</sup>See *THE SURVEY*, May 4, 1912.

## PERSONALS

"Under the competitive system, the struggle is not worth while," said the note left between the leaves of the book he was reading by "One Hoss" Wayland, the pioneer of effective Socialist periodical propagandists in the United States, who died by his own hand this month. Grief for his wife, who was killed in an accident about a year ago, added to twelve years' battle with cancer, to his friends' minds, accounts for his dying mood of pessimism, rather than fear of a pending federal indictment; for Julius A. Wayland, the job printer who fifteen years ago started the *Appeal to Reason* on his own little free press, never before shunned a fight.

With Debs and Warren, the other members of the *Appeal* staff, Wayland attacked the federal courts, not on theoretical grounds but in the way that was more effective, by searching out the professional records of the judges and their decisions in cases where human and property rights were in conflict. He entered upon his longest fight when he undertook to raise a fund through the *Appeal* to finance a difficult liability suit in behalf of a workman, Frank Lane, and carried it from court to court until he got the injured man one of the highest awards on record in accident cases.

To test the legality of the spiriting across state lines of the labor leaders in the Western Federation of Miners' cases, which Justice Harlan so roundly criticized from the bench, the colleagues of the *Appeal* offered a reward to any man who would kidnap Ex-Governor Taylor and bring him within the grasp of Kentucky authorities, and in so doing risked a jail sentence for misuse of the mails. They are now again under indictment, on account of charges brought against the management of the federal jail at Leavenworth.

The Leavenworth exposures led to investigation and reform, and Wayland never looked upon this or the earlier prosecution as anything but excellent propaganda for his cause, in the same way that in his racy journalism he broke from the traditions of the old theoretical tracts of the Socialists. This propaganda is carried on throughout the country by half a million subscribers who pass their paper on to half a million more, and it has been no small factor in the increase of the Socialist vote during the life of the *Appeal* from a few thousand to a million in the election just passed. M. B. S.

\* \* \*

This month Henry F. Burt, for five years head of Pillsbury Settlement House, Minneapolis, became superintendent of Lake Superior Mission, Lake Superior, Wis. Before going to Pillsbury House Mr. Burt had been connected with Sears, Roebuck and Company and prior to that with Chicago Commons.

The Minnesota State Training School for Boys has a new superintendent in the person of Charles O. Merica. The state reformatory has just lost by resignation Supt. F. L. Randall.

Berkel y Greene Tobey has been appointed financial secretary of the Boy Scouts of America, with headquarters in New York. With a budget of about \$100,000 a year, and with scouts organized in practically every city, town and village in the United States, with the publication of a monthly magazine for boys, and the supplying them with scout uniforms, camp kits and other equipment, the organization has tackled a big task in an energetic way under the direction of James E. West, chief scout executive. Mr. Tobey has been financial secretary of the Philadelphia Society for Organizing Charity.

\* \* \*

Sherwood O. Preston, for twenty-six years connected with the second oldest charity organization society in the United States, died last month in New Haven, Conn., at the age of sixty-four years. The New Haven society was founded in 1878, the year after the establishment of the Buffalo society. Mr. Preston came to New Haven as agent in 1886. He was soon elevated to the superintendency of the organization and in that capacity did pioneer work in bringing about effective co-operation on the part of the city charitable societies. Though his occupation previously had been that of a mechanic and he had been little in touch with social conditions, "his practical sense," says Prof. Henry W. Farnam, "at once put him in touch with the forward movements in the administration of charities."

The selection of Mr. Preston's successor is a striking illustration of the changed approach to philanthropic work which has taken place in a generation. Prof. William B. Bailey, a graduate of Yale, has been successively instructor and assistant professor of political economy in his *alma mater*. He has specialized in the subjects of poor relief, criminality and statistics, and was in charge of the last federal census in Connecticut.

\* \* \*

After three years' absence, during which she held the position of Director of the Bureau of Social Research of the New York School of Philanthropy, Pauline Goldmark returned this fall to the New York Consumers' League, to fill the position of Executive Secretary. Mary R. Chamberlain has been appointed to fill the new office of assistant secretary, and with this addition to its forces the league is planning to reorganize its work in the direction of greater efficiency, and to devote special attention to law enforcement, a phase made especially important by the recent shortening of women's hours of labor by the fifty-four hour law.

\* \* \*

At memorial services in honor of David Blaustein, former superintendent of the Educational Alliance and lecturer on immigration at the School of Philanthropy, New York, it was announced that the alliance had decided to preserve the memory of the founders and most active workers of the institution by naming rooms in the building after them. The auditorium has

been named for Isidor Straus, and other rooms for Mr. Blaustein, Julia Richmond, and Morris Loeb.

\* \* \*

Joseph P. Byers, who was recently appointed commissioner of charities and correction of New Jersey, had for two years been secretary of the State Charities Aid and Prison Reform Association of that state. C. L. Stonaker, for seven years secretary of the Colorado State Board of Charities and Board of Pardons, succeeded Mr. Byers.

## JOTTINGS

### PUTTING LIFE IN YOUR STATE CONFERENCE

For states which have heretofore had trouble in making their conferences of charities and corrections aggressive and well-attended affairs there may be suggestion in the schemes resorted to in Maine and Minnesota this fall. In Maine an attempt was made to bring all the state-wide social service organizations together so that every source of interest would be tapped. The program was distributed among the Anti-Tuberculosis Association, the Children's Committee, the Prison Association and the Child Labor Committee. Each of these is represented on the executive committee for next year. A movement is under way to make this committee the organ through which the legislative work of all four bodies will be pushed, thus quadrupling the support behind each measure.

Among the penal improvements looked for in Maine now are jail reform, reformatories for women and young men, a farm for inebriates, such as Massachusetts, Minnesota and Iowa have now, and the establishment of juvenile courts. "The jail system of Maine is a disgrace to the state," said E. P. Wentworth, president of the conference. "It is archaic, unscientific, unjust, inadequate, inefficient, and considering the little good and the great evil it does, it is extravagantly costly."

### HOW THEY DID IT IN MINNESOTA

In Minnesota the County Commissioners' Association, the Child Labor Committee, the State Sanitary Conference and the Anti-tuberculosis Association united their forces to make the conference a success. State, county and city officials were on the program. In Minnesota county commissioners attend the conference at public expense.

Social workers in Minnesota hope to see both employers' liability and workmen's compensation laws passed this winter. A re-organization of the state bureau of labor after the fashion of the Wisconsin plan, including civil service appointment, is contemplated. The conference gave particular attention to the need for re-organizing the state's facilities for taking care of dependent and delinquent children.

The State Board of Health and the Department of Public Instruction of Minnesota wish

to lend their aid to the schools of the state in promoting health supervision of school children. To this end, the board has engaged the services of Dr. Ernest B. Hoag, formerly of the University of California, to help Minnesota towns and cities to organize health work in schools. Dr. Hoag is spending a year traveling about the state, spending from one day to two weeks in a single place. It is proposed to demonstrate to towns, cities and counties that rational conservation of the mental and physical health of school children is possible with the means already at hand. Three plans are being proposed: Organization with a medical officer and nurse or nurses; organization with school nurse or nurses only; and organization by the employment of a simple non-medical health survey on the part of the teachers only. Such a survey is provided by a series of questions based upon ordinary observation of physical and mental conditions. The outline for this purpose will be furnished by the State Board of Health—one for each child. No community need wait for the employment of a medical officer in order to begin sensible health observation of school children.

#### MUNICIPAL LIBRARY IN ST. LOUIS

Officials of city departments and students of municipal affairs are finding great use for the Municipal Reference Branch Library recently established adjacent to the chambers of the city council by the St. Louis Library. The library board pays the salary of the librarian of this branch and all regular library expenses and the city furnishes the room. The branch is for municipal information and research,—its duties being to collect, classify, index, and preserve all data obtainable relative to the operation and government of municipalities; as well as material bearing on the welfare and health of their inhabitants. The charters, laws, and ordinances of St. Louis and other cities have been collected, together with all data, reports, and statistics obtainable from other cities in the United States, Canada, and Europe. The library also gathers facts from magazines, newspapers, and reports of organizations working along the lines of municipal reform and civic betterment. Such books, bills, documents, reports, and other material are readily available to anyone, particularly to members of the Municipal Assembly and of other departments of the city government.

With the establishment of the Municipal Reference Branch, it is declared that no ordinance need be passed and no department of the city government need try any new scheme, measure, or device without full knowledge of what other cities or corporations have done along similar lines, and with what degree of success.

#### MEMORIAL SERVICES FOR PROFESSOR NASH

Memorial services are being planned in honor of Henry Sylvester Nash, late professor of the literature and interpretation of the New Testament at the Episcopal Theological School, Cambridge, Mass., who died this month at the age of fifty-eight. The exact time and place of the services, which will occur in New York, have not been determined.

## CALENDAR OF CONFERENCES

### DECEMBER CONFERENCES

- CHARITIES AND CORRECTION.** Colorado State Conference of. Denver, Dec. 10. Sec'y, William Thomas, Capitol Building, Denver.
- CHARITIES AND CORRECTION.** Florida State Conference of. Tampa, Dec. 6-10, 1912.
- CHARITIES AND CORRECTION.** Kansas State Conference of. Lawrence, Dec. 5-7. Sec'y, Victor E. Helleberg, University of Kansas, Lawrence.

### SURVEY ASSOCIATES, INC.

Founded in the '90's by the Charity Organization Society of the City of New York,—entrusted in 1905 to a National Publication Committee,—THE SURVEY has now been turned over by the parent society to an independent organization, open to its readers.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts. Five readers contributed \$1,000 each in the publishing year 1911-12; five \$500 each; fifteen \$100 each and 649 \$10 each—altogether over 700 readers thus contributed \$10 or more toward the budget the past year—twice the number of the year preceding.

With this democratic, convinced backing as a natural membership base, the SURVEY ASSOCIATES, INC. becomes in fact—what THE SURVEY has long been in spirit—a mutual enterprise.

A review of last year's work and an announcement of the details of organization of the SURVEY ASSOCIATES was sent to every subscriber of THE SURVEY in the same wrapper with the issue of November 23. Additional copies of this pamphlet will be sent on request.

## THE COMMON WELFARE

### THE SIXTY-SECOND CONGRESS AND SOCIAL LEGISLATION

The Sixty-Second Congress, now in its last session, has been notable for the passage of legislation of a social character. This fact is no doubt in part due to changing political conditions and changing politics. To a certain extent the "play for the labor" vote, which invariably is made just previous to an election, was repeated during the summer but in the shifting party alignments which we have been witnessing, no one party, except the Socialist with its one Congressman, definitely undertook to represent labor. Every bill that passed Congress was voted for by Democrats and Republicans alike—and was voted against by Republicans and Democrats alike also.

Among the achievements of the present Congress in social legislation up to the date of its re-assembling on December 2 were these:

The Phossy Jaw Act, prohibiting the use of white phosphorus in the manufacture of matches.

The eight-hour law and the eight-hour provisions in the postal, fortifications, and naval appropriation bills—not new legislation, but an extension of old.

The provision in the postal appropriation bill allowing federal employees to petition Congress and join what organization they please.

Extension of the Federal Workmen's Compensation Act.

Amendment to the postal appropriation bill, giving to publications of labor and fraternal organizations the same postal privileges as are given to other publications.

Establishment of the Children's Bureau.

Establishment of the Commission on Industrial Relations.

The Senate passed two bills which the House failed to act upon, namely, a workmen's compensation bill and an immigration bill, the latter imposing further restrictions, including an illiteracy test and including, also, the Root amendment providing for the apprehension of political refugees.

The House has passed several bills upon which the Senate has not acted: the Clayton contempt bill, the Clayton injunction bill, the Sulzer Department of Labor bill, the Booher convict labor bill, the seamen's bill and provisions for the extension of the service of the Bureau of Mines.

During the winter session of Congress it is generally admitted that the Department of Labor bill will pass the Senate so that, unless vetoed by President Taft; President-elect Wilson will have a tenth cabinet officer to appoint. It is probable that there will be some compensation legislation. There is likelihood of pressure being brought to bear upon the Senate to put it on record on the convict labor bill; and Attorney-General Wickersham's proposal for a federal inquiry into jails will be urged. The work and proposals of the President's Economy and Efficiency Commission may become active points of public interest.

Another matter to come before Congress of special interest to readers of *THE SURVEY* is the question of granting funds to the American Red Cross Society with which to purchase a site for a building of its own. The appropriation of this money, if made, will bring to a successful end a movement begun some years ago by the New York State Commandery of the Loyal Legion to raise a suitable memorial in honor of the loyal women of the Civil War. The leader in this at-

tempt has been Captain James A. Scrymser of New York.

It was Captain Scrymser's desire to make the memorial as useful as possible, and so it was suggested that \$300,000 be raised for a building to house the Red Cross Society. The understanding was that Congress should be asked to provide a suitable site and that the Red Cross should maintain the building after it was erected. Bills appropriating \$300,000 to buy ground were introduced into both houses of Congress and in due season the Senate committee reported its measure back favorably, increasing the amount to \$400,000. In this form, the bill passed the Senate unanimously last June. The House committee then took the Senate bill and on the last day of the session recommended it favorably. It is now on the calendar to come up early in the session which opened this month.

#### MORALS COMMISSION URGED IN ST. LOUIS

The executive committee of the St. Louis Joint Committee on Public Morals, representing thirty civic, social, religious and medical organizations, has recommended the creation by the Municipal Assembly of a permanent commission on public morals to eradicate the social evil in St. Louis. It will be remembered that such a permanent public commission was advocated by the Chicago Vice Commission, as a result of its investigations, and a semi-public morals commission has been appointed the past year in Pittsburgh.

The report, based on an exhaustive investigation, states that there are eighty-six houses in St. Louis which should be suppressed, and that 556 persons live in them. Fourteen of these, the report states, are outside the three segregated districts. Twenty-one hotels are suspected of being conducted illegally.

The committee holds that commercialized vice is not a necessary evil, but that its elimination is more than a problem of law enforcement, and will require a long and systematic campaign. It opposes an attempt to eradicate vice by a single sweeping act of police suppression, holding that such a plan failed recently at the hands of the Chicago authorities, and would fail in St. Louis. The committee urges that with the aid of the police, the excise commissioner and the circuit attorney, the evil can be eradicated eventually.

The program recommended includes the prohibition of the sale or serving of liquor in disorderly houses, dancing and music. The committee would prohibit a house once closed from ever re-opening and would prohibit the opening of new houses.

The report advises jail sentences for persons who violate the strict regulations it would

have the police impose. Segregation is opposed as being an official recognition of vice. St. Louis is declared to have fewer objectionable houses than any other large city in the world, and the police department is praised as an efficient system of police administration. These and other of its features will be reviewed in their larger aspects in a later issue of THE SURVEY.

#### THE CARNEGIE CORPORATION FOR "THE WANTS OF THE AGE"

Announcement was made in November that Andrew Carnegie has within the year transferred a total of \$100,000,000 to the Carnegie Corporation of New York. The purpose of this corporation, to which \$25,000,000 in addition was given by Mr. Carnegie at the time of its launching a year ago, is to receive and maintain funds the income of which is to be applied

"to promote the advancement and diffusion of knowledge among the people of the United States, by aiding technical schools, institutions of higher learning, libraries, scientific research, hero funds, useful publications and by such other agencies and means as shall from time to time be found appropriate therefor."

In the event of his death any accrued surplus not provided for in his will will be added to the fund of the Carnegie Corporation.

The eight trustees of the corporation, who are in the main the heads of the various philanthropic trusts heretofore established by Mr. Carnegie, are empowered to modify or discontinue by a two-thirds vote any branch of the service which in their judgment may have become inadvisable or unnecessary; or if better use can be made of the funds, they can adopt from time to time such work as they may deem most desirable "for the wants of the age," so that "from age to age" the fund may be expended upon the most profitable work, whether it be the promotion of new ideas or the development of those of the day. To illustrate, it would be through this corporation that the proposed pensions of \$25,000 a year to ex-presidents of the United States would be paid.

The total amount of Mr. Carnegie's benefactions is estimated to be:

Hero funds.....	\$7,250,000
Carnegie Teaching Fund.....	21,500,000
Carnegie Institute, Washington.....	22,000,000
Colleges in United States and Canada..	20,000,000
Colleges in England.....	6,800,000
Trust for Scottish universities.....	10,000,000
Dumfermline Trust.....	2,500,000
Carnegie Institute at Pittsburgh.....	22,000,000
Relief Fund for Steel Workers.....	4,000,000
Gift for Church Organs.....	4,000,000
Pan-American Building.....	750,000
Hague Peace Tribunal Building.....	1,500,000
Peace Endowment.....	10,000,000
Libraries.....	50,935,000
Total.....	\$183,235,000

See THE SURVEY, November 18, 1911.

## SOJOURNER TRUTH HOUSE

"Lena Edwards," called the clerk in sonorous tones.

All eyes in the court room turned to a wee mite of a girl thirteen years of age, followed by a wild-eyed, untidy woman who shuffled up to the desk and there registered herself as Lena's mother.

"What is the charge?" asked the judge.

"Theft and improper guardianship, your honor." The officer, who had brought the child to court, stated that she had been accused by a neighbor of stealing \$2 and of living in an immoral atmosphere.

"Did you steal this money, Lena?"

"Yes sir."

"What became of it?"

"I bought some shoes and something to eat," replied the child.

The mother was then called to the stand, and after much questioning, the following story was revealed: Seven years before she had deserted her husband and the plain little country home he had provided for her on a small Virginia farm, bringing with her her little girl, then six years old. She came to New York to the reputed land of plenty, to become a part of the visionary stories of freedom, good time and abundance, as told by girl friends living in New York on their occasional visits to their homes in the country. On ar-

iving in New York, with its high cost of living, she soon found and adopted the "easiest way." She had gone from bad to worse until she was steeped in depravity.

At the time of Lena's arrest, she was living with her mother in three rooms in a cheap West Side tenement house. Lena stated that there had been three different men living in the flat within ten months, and that she had been told by her mother each was her stepfather. On the refusal of the child to call them father she had been often whipped and half starved. In sheer desperation, she had stolen the \$2 for food and shoes. The judge, after

severely reprimanding the mother about the poor example set for her child, and remarking how fortunate it was that the child had been brought to court before it was too late to save her, committed Lena to an institution for delinquent girls.

This case is no different from many that come before the Children's Court. In this instance, however, little Lena Edwards is a colored child. She was finally turned over to a probation officer. There was no room for her in the training school at Hudson, for the two cottages there providing for colored girls are always crowded. The private institutions refuse to take colored girls in numbers greater than one or two in each institution, and many of them refuse to

### "THE SPIRIT OF CHRISTMAS"

The title and cover design of a little book just issued by the Frederick A. Stokes Company, in which Arthur Huntington Gleason, a former member of THE SURVEY staff, and later of *Collier's*, tells what can be made of the great holidays, and how their spirit may be extended over all weeks.

"Christmas," says Mr. Gleason, "is coming, but never yet has it come. It has not fully dawned while still a child's careless laughter is drowned in the dreary noise of machines, while yet a maiden, who might be pondering her merces, is weary in her young days with the heaviness of shame and anxious toil, while yet a mother must needs turn from the child at her breast and the children at her knee. So to our Christmas we will little let in a richer music, like a golden tongued bell turning from a minor to a song of the ultimate triumph."

RECEPTION HOUSE AT BEDFORD LABORATORY OF SOCIAL HYGIENE

This new building at Bedford Reformatory will play an important part in the application of science to the criminal laws with respect to women. It is of hollow tile and concrete construction. The outside will be stucco finished and have a variegated green and mottled purple slate roof. The stairs are of steel and iron with marble treads and platforms. Everything has been done to make the building as fireproof and sanitary as the funds at hand would permit, and yet retain a home-like and attractive appearance, features too often lost sight of in the planning of an institutional building.

take them at all. Therefore, this child had to be returned to her "home" where the conditions were unchanged.

A recent investigation made by the National League on Urban Conditions among Negroes shows that over ninety such cases annually are in need of institutional care. At least sixty of this number are turned back upon the streets, because of lack of room in state institutions or refusal of private institutions to receive them.

To meet this urgent need and to give these unfortunates an opportunity to demonstrate to the community their right to freedom, a committee, under the chairmanship of Elizabeth Walton, has recently opened a financial campaign to establish the Sojourner Truth House. The name is, of course, chosen as a memorial to the great ante-bellum leader of Negro women, who not only preached the gospel of the abolitionists, but did work in the courts among the unfortunate girls of her race. The colored people of the community feel so keenly the effect of turning these girls back on the streets and back into their unwholesome surroundings, that they are struggling to raise among themselves one-tenth of the \$1,500 needed, and have already turned over half of this amount.

#### THE LABORATORY AT BEDFORD, N. Y.

The picture here shown is the architect's drawing of the first building to be erected as part of the laboratory of social hygiene in connection with the New York State Reformatory for Women at Bedford. As previously announced the purpose of this laboratory, of which Katherine B. Davis, head of the reformatory, will be in charge, is to work out a methodology for the use of magistrates in disposing of the cases of girls convicted of crime.

The project which has involved the purchase of eighty acres adjoining the reformatory estate, is being undertaken by the Bureau of Social Hygiene, composed of John D. Rockefeller, Jr., Starr J. Murphy, Paul M. Warburg and Miss Davis. It is regarded as one of the most significant developments of the year in the field of penology. The difficulty experienced by judges in prescribing suitable treatment for wayward girls after conviction has led to the belief that we must know more about the inducing causes—psychological, economic, social—of crime before we can expect reformation to follow punishment. This information the new laboratory, with its departments of psychology, sociology and nervous pathology, is designed to give.

The highest point on the site selected is occupied by a house which will be used by the staff for living quarters and for part of the research work. On a plateau a little lower in ele-

<sup>1</sup>See THE SURVEY, May 18, page 285.

vation the reception house shown here will be erected. It is expected that it will be in use by the middle of next summer. One of the features of the laboratory will be the quarantine section. Here each girl will first enter the house by a separate entrance, be given a bath, and be examined by the resident physician. Her clothing will be sent at once to the laundry (which has a direct connection with the quarantine section) to be disinfected and then kept for her until she is discharged. She will be given fresh, clean clothing and assigned to her room, where she will be under observation and kept apart from the others until her quarantine time is over. Even her meals will be served in her room during this period. There are sixteen rooms in the quarantine section and it is expected that each girl will be kept in quarantine for two weeks.

The general plan of the building, which has been designed by Franklin B. Ware and Arthur Ware, architects of New York, is that of the letter U with its ends spread apart, the court thus formed facing the south, and insuring a maximum amount of sun-light. There is a sun parlor fifteen feet wide and sixty feet long. The building will be two stories in height and will contain fifty-one bedrooms for committed women, a room for the head matron, three rooms for ward matrons, six officers' rooms, one guest's room, an office, visitors' parlor, officers' parlor, officers' dining-room, general dining-room, kitchen and laundry, and general recreation room.

#### THE SOCIALISTS AND THE OLD LINE UNIONISTS

For two days during the recent convention of the American Federation of Labor, controversy raged between the so-called radical and conservative elements in that organization. On November 19, Frank L. Mulholland of Toledo, Ohio, one of the attorneys for the defendants in the Danbury Hatters' case that has been in the courts since 1902, brought out in a vigorous speech his interpretation of the significance to organized labor of the recent decision of a United States court affirming the award that had been previously made against the Hatters' Union. As an indication that certain employers have been quick to recognize in the Sherman anti-trust law as so interpreted the possibility of a new weapon in their conflicts with organized labor it was stated that in West Virginia, where a strike is now in progress, suit has been brought against the United Mine Workers for \$750,000 damages on the charge of interfering with the business and damaging the property of the mine operators.

This, of course, had nothing directly to do with any controversy between the Socialists and the non-Socialists of the convention, but as the discussion became general over the relation of the Sherman Anti-Trust Law to organized labor, delegates all over the hall began to address the convention, contending that here was indisputable proof that now organized labor must go into politics. The Taff-Vale decision in England was cited as the turning-point in the policy of British trade unionism. When the Association of Railway Servants was obliged by a court to pay a very large sum in damages to a railway company against whom they had been on strike, organized labor went into politics and returned forty-one members to Parliament the next year, who were instrumental in securing the passage of the Trades Disputes Act, which exempted unions from being sued in such cases. This, argued the delegates, pointed the way for the trade unionists of America, and showed that only through united political action and the election of labor representatives to Congress would they be able to free themselves from the imminent danger in which they declared themselves to be placed by these recent interpretations of the Sherman Anti-Trust Law.

It was evident in all of this discussion that most of the delegates who were advocating a resort to politics belonged to the Socialist contingent in the convention. Less was being said regarding politics by the old-line trade union delegates. For the most part, they sat in silence, but finally the pressure became too great and an outburst came from D. A. Hayes, president of the Glass Bottle Blowers' Union and member of the Executive Council of the American Federation of Labor.

"Why don't they come out in the open and say that they mean the Socialist Party," cried Hayes, "when that is exactly what every one of them does mean? We know that they do not endorse the action of the American Federation of Labor and that every one of them is acting contrary to the spirit of the Federation and in defiance to the principles that have been enunciated by this body."

This started the fireworks. The whole Hayes family forthwith got into action—Max Hayes, of the Typographical Union and Frank Hayes of the United Mine Workers rose to defend their position as Socialists and Federationists as well. Finally, the excitement grew to fever heat when President Gompers left the chair to deliver a bitter denunciatory speech addressed directly to the Socialist members of the convention, accusing them of bad faith, of failure to support workmen candidates for office when they had the opportunity, and of carrying on a warfare

against the policies of the Federation. Drawing himself up to his full five feet three inches, the long time leader of the American Federation of Labor brought his invective up to a stirring climax at the same time that he brought his fist down on the table with such force as to upset a water pitcher, thus easing the tension while the valuable papers upon the desk were being rescued from the flood.

#### "ONE BIG UNION" OR THE CRAFTS

But it was the next day that the real fight came between the radicals and the conservatives. The delegates of the United Mine Workers, under instructions from their organization, brought in a resolution committing the American Federation of Labor to an endorsement of industrial organization instead of the present organization by crafts. Industrial organization means "one big union" in an industry, including in its membership all of the workers in that industry. The present craft unions on the other hand are organized along distinct trade or craft lines, as blacksmiths, molders, pattern makers, etc. At the present time the mine workers and the brewers are organized industrially, and that is also the scheme of organization of the Industrial Workers of the World, the militant body altogether outside of the American Federation of Labor, which conducted the Lawrence strike last winter.

The proposed resolutions were referred to the committee on education which brought in a majority and minority report. The majority report reaffirmed the present attitude of the Federation and re-indorsed the scheme of craft organization. The minority report read as follows:

"That where practicable one organization should have jurisdiction over an industry, and where, in the judgment of the majority of the men actually involved, it is not practicable, then the committee recommends that they organize and federate in a department and work together in such manner as to protect, as far as possible, the interests of all connecting branches."

During the entire day the conflict raged over this resolution for under the rules of the convention the minority report had to be considered first and voted on. There were staunch supporters of that report, and they were among the ablest speakers present. Chief among them were the representatives of the United Mine Workers and the Western Federation of Miners; some of them party Socialists, others of them anti-Socialists, but equally ardent advocates of industrial organization.

One of the most impressive things in the entire convention was the kind of men representing the United Mine Workers of America. Seldom in any gathering, other than one composed of men accustomed to public speaking, would you en-

counter a single delegation so capable of effective argument upon the floor as were these men of the mines. There was John Mitchell, calm, deliberate and polished; there was John P. White of Iowa, the giant president of this organization of 380,000 men. Standing over six feet, graceful in his bearing, apparently conscious of unlimited reserve force, he made a most effective argument before the convention. There was Frank Hayes, sincere, direct and desperately in earnest; there was John Walker of Illinois, fiery, enthusiastic, carried away with his subject; and there was Duncan McDonald with the face and bearing of a Sunday school superintendent, arguing with utmost calm but with tremendous sincerity in favor of the industrial form of organization. These were ably seconded by Joseph Cannon of the Western Federation of Miners and by others on the floor of the convention.

On the other side, standing for the traditional policy of the American Federation of Labor and against all change, there was the united front of the executive council, the old war horses of the movement, Samuel Gompers, John B. Lennon, James O'Connell, James Duncan, J. F. Valentine. They hailed from an earlier stage of the labor struggle than their opponents. Most of them are gray-haired. Some of them were national figures in the labor movement at a time when half the delegates in the convention were in knickerbockers. They could recall the days when the Knights of Labor organized on industrial lines and long since wrested from leadership was the commanding labor organization of the country and they, with a handful of seceders were holding conventions under the name of the Federation of Organized Trades and Labor Unions. All of these older leaders took the floor to oppose this change from the form of organization in behalf of which they had fought for thirty years.

The most striking figure on the floor appearing for the maintenance of the old order was, however, Andrew Furuseth, president of the Seamen's Union. "I always think of a Viking when I see Furuseth," said a visitor to the convention. "I do not know what his nationality may be, whether Swede, Norwegian or Dane, but none of them seems really to describe this man. I find myself instinctively calling him Norseman. There is something in that old word suggesting all the spirit of valorous sea fights. This is the sort of virile independence that you see in Andrew Furuseth."

There was no man on the floor of the convention treated with greater respect. No one could hear him speak and doubt his sincerity. He feared that the new industrial organization that was being proposed was going to be destructive of individual liberty. He feared that in the rule of a thoughtless majority, in a great aggregation of

workmen of diverse interests, the spirit of a little group whose interests might be different from those of the others would be altogether crushed and their interests forgotten. "This proposition," said Furuseth, "is one of the most cruel, heartless, bitterly unjust proposals that has ever been advanced upon the floor of any convention of the American Federation of Labor." One of his speeches against the trend toward what he regards as industrial tyranny he brought to a close with words not to be forgotten. "I do not care," he said, "who wears the crown, whether someone else wears it or whether you wear it. I hate a crown."

All day long the argument went on; the convention adjourned for lunch and returned to the fray again. Dramatic incidents were not lacking and a physical encounter upon the floor of the convention was narrowly averted; and yet one could not but be impressed by the calmness, the cool-headedness that prevailed throughout, especially on the part of those representing the new order in American labor circles, the radicals who were fighting for the changed policy. When the vote was taken, the old order was sustained by a vote of about two to one and yet there was no one upon the floor of the convention more cheerful than were the radicals who had all day led the fight. They had not expected anything but a reverse on this question of industrial organization. They were merely laying the foundations, they said, for what they hope will be ultimate success.

#### CUTS IN THE NEW YORK CITY BUDGET

Civic and charitable organizations and private individuals throughout New York are protesting against the cuts made by the aldermen in the budget for 1913. More than half a million dollars relating largely to the social service work of the city has been stricken from the appropriations. Some of the cuts are \$20,000 for a municipal reference library, \$10,000 for the standardization of salaries and \$225,000 for special teachers in the schools. The Department of Health also loses a big sum. The mayor who can still veto the reductions has received many letters asking him to restore the items eliminated.

#### ANNUAL MEETING OF THE NEW YORK CHARITY ORGANIZATION SOCIETY

The annual meeting of the New York Charity Organization Society, on the evening of December 10, will be devoted exclusively to the work and plans of the New York School of Philanthropy. Addresses will be given by Director Edward T. Devine, Porter R. Lee, Dean F. J. Woodbridge of Columbia University and Robert W. de Forest, president of the society.

## EDITORIAL GRIST

### THE CONFIDENTIAL EXCHANGE

EDWARD T. DEVINE

The appearance of Miss Byington's excellent pamphlet,<sup>1</sup> describing the method, purposes and spirit of the confidential exchange, gives suitable occasion to call attention to the remarkable progress which is taking place just now in the charity organization movement as a whole, and especially in its original and most characteristic feature.

Organized charity means several distinct although closely related things. One is that all efficient help is and must be based on full and verified knowledge of the pertinent facts. This is the original *survey* idea. Relief, in order to satisfy either the intellect or the emotional nature, must look all around the situation. To the superficial eye the distress to be relieved always presents itself as much simpler than it really is. Relief must dig beneath the appearance of things to the reality. Investigation need no longer apologize or explain. The most "sentimental" relief-giver, and the most scornful critic of "scientific methods," now pay the homage of imitation to this part of the program of organized charity. Any one who does not "investigate," "keep a record," and stoutly profess a full appreciation of the importance of getting all the essential facts, is very hard to find. In this respect performance of course still lags sadly behind profession, even in some so-called charity organization societies. Families are receiving relief who have never been seen at home. "Homeless" men are receiving relief whose families would be interested to learn of their whereabouts. Children are supported in institutions pending the time when they will be old enough to earn something for parents who are not meeting their parental responsibilities. And all kinds of blundering interference in family affairs goes on more or less everywhere simply because neighborly persons desirous of helping, and even paid visitors employed to help, do not yet realize what things need to be known as a basis for sound decisions, and how to get that information without loss of time or injury to the persons concerned.

A second thing which organized charity means is the co-ordination of social activity in the community. To prevent waste from overlapping; to stretch out meagre resources so as to fill the gaps; to increase the effectiveness of each by bringing them into right relations with one another.

<sup>1</sup>The Confidential Exchange, a Form of Social Cooperation. By Margaret F. Byington. Charity Organization Department of the Russell Sage Foundation. Price 5 cents.

INDIVIDUAL GOOD WILL—

other; to put the experience and the ideas of each more readily at the disposal of all; and to do all this not in a superior or dictatorial spirit, but in a co-operative, fraternal, democratic spirit of mutual service, this has been the aim of organized charity on its social side, just as adequate relief and prevention based on accurate knowledge has been its aim in relation to individual distress.

The confidential exchange represents both of these ideals; but it is essentially a very modest and obvious piece of mechanism. Like census enumerators and all expert statisticians, those who have been responsible for the exchanges have discovered that their success is apt to be in inverse ratio to the elaborateness of their program. That is to say, it is better to ask only for the information actually required for the purpose and not to expect a piece of mechanism which is admirably adapted to one purpose to perform others which may turn out, as in this case, to be incompatible with the end in view. The confidential exchange begins to do what is expected of it when it ceases to be also a record of family histories. The exchange is a card index; and in order to perform its proper function it must remain as impersonal as a telephone exchange. Its function is to enable each person or agency who has occasion to give relief, or perform any kind of social service for a particular family, to find out quickly what other persons or agencies, if any, have a similar interest or have had experience with the same family. The exchange has this information in its card index simply because others have made similar inquiries. Over the telephone or by mail or in a personal interview at the exchange each inquirer is informed as to what others have known the family in question. The inquirer may do what he likes with this information. Generally, if he is co-operative and considerate of the best interests of those whom he seeks to aid, he will get into communication with them. This will probably save the family a new and unnecessary investigation, because the previous inquirer probably already has the pertinent information and may already have made an adequate plan into which the new ally can fit with his particular contribution. In order to fulfill its complete function, however, the confidential exchange has

one more simple but obvious task. It must inform those who were previously interested that this new inquiry has been made. Some one of them may have special reasons for getting into touch with any additional resources, or to know of any new appeal which is made. Like the last inquirer they may or may not use the clue, but at least it is in their hands.

The confidential exchange which is conducted by the Associated Charities of Boston is very properly selected by Miss Byington for special description, for the reason that it is already more widely used than any other and because it has developed naturally and gradually from the original registration bureau of that society. In many other cities, however, the idea has now taken hold, sometimes as a part of the local charity organization society and sometimes under the joint responsibility of several agencies. The former method seems more likely to succeed as it fixes definite financial and administrative responsibility; and the complete separation of the confidential exchange from the society's registration bureau, in which are kept the records of its own investigations and treatment, removes any obstacle which might arise from a reluctance to "register cases." When the only purpose of an inquiry, and the only possible result of it, is to put two or more agencies which are mutually interested in a particular problem into mutual relations with one another, there can ordinarily be no valid reason for hesitating to make the inquiry; and experience is showing that in fact there is no such hesitation.

The present rapid growth of such confidential exchanges is but indicative of the new spirit and energy of the whole charity organization movement. New societies are constantly being formed and old societies are taking on new life. The principles for which the societies have contended are winning wider acceptance and are justifying themselves in new applications. The ideas of inculcating self help and self-reliance; of discrimination in relief; of personal and family rehabilitation, of giving to all a fair opportunity and then expecting them to be fully responsible for the use which they make of that opportunity, of developing strength rather than merely ensuring comfort, of seeking the underlying causes of distress whether they are inborn or environ-

*From the catalogue of the Louisville Child Welfare Exhibit.*

—AND ORGANIZED CHARITY

mental, of co-ordination in social service, of training for efficiency, of giving first place to prevention, of thoroughness in investigation, of the making of definite plans, and of adequate relief—these are the ideas of organized charity, and they are making their way. Of course none of them was invented by the charity organization societies and of course none of them is a monopoly of these societies. But to promote and apply them in the field of charity, and to furnish the means by which all people of good will may carry them into practical effect, was the original purpose and is still the reason for the existence of such societies. The more widely these ideas are accepted and acted upon the better the societies will be pleased. No one need fear an action for infringement of copyright for preaching or practicing the principles of organized charity—nor is jealousy likely to be aroused by any claim that some other institution had discovered this or that idea long before the first charity organization society was founded. Perhaps the best way of showing a genuine interest at the present moment in the co-ordination of social work, and the prevention of waste in philanthropy, is by helping to develop and to secure the widest possible use of the community card index.

## SOCIAL HYMNS

SIMON N. PATTEN

University of Pennsylvania

The statement of a new social need in a recent number of *THE SURVEY* has brought forth responses.<sup>1</sup> There seem to be some who, like myself, want an emotional expression of what to them is a holy cause. Several songs have been received; and I have no doubt others will be forthcoming. I have suggested to the editors that we have a special number in which social poets can have a hearing. This plan will be carried through if enough material is offered to make it worth while.

I am not a poet and thus have little right to

<sup>1</sup>Wanted: a New Social Worker, *THE SURVEY*, November 2, 1912.

criticise, but it seems to me that poets fail by taking too complex a theme. Songs must be clear and expressive to take hold of the imagination. Nor do I think they should all be on the wrongs of humanity; nor need they emphasize the hopelessness of earlier ages. We have had enough of "The shades of night are falling fast." It would be far truer to sing of the beams of light that are coming fast. Why should we not look ahead, instead of backward at what has been.

One thought I expressed has not been followed up in the responses received. Perhaps its import was not understood. Good themes come to all of us in moments of inspiration. If each of us told how we see the coming events in such moments, we could direct some poet's thought into right channels. In a recent poetic contest at Oxford, the entrance of King Richard into Jerusalem was set as the theme. Can we not get nearer home than that? I shall suggest a theme in the hope that others following suit may turn the thought of some poet in the right direction.

During the great meteoric display some eighty years ago, a sailor fixed his eye on the north star in the belief that he was safe so long as it remained in its place. Finally, he thought he saw it start on its downward path. Thinking the end of the world had come he fell on his knees begging for mercy.

So runs the story. Are we not like the sailor? In the darkness and bewilderment of past ages some north star was our guide. To this we cling when the light of day is making it dimmer and finally will cause it to disappear. Should we, bemoaning its disappearance, sink in terror at the loss of our former guide when the conveying beams indicate so plainly the rising sun. Could not some one, bidding an affectionate farewell to the good old north star, turn our attention to the coming dawn? The "Golden City" with its ruby paved streets might also be replaced by the future city where we would all like to dwell.

Somehow or other all poets want to revive the past. Is it impossible to turn them about so that they see what the future has to offer? If we can our cause is won.

## THE SHOP-EARLY CAMPAIGN IS IN FULL SWING

Buy your Christmas presents  
EARLY—early in the day and  
early in December. That  
will be your biggest gift of  
the holidays to the  
workers behind the  
counters and on the  
delivery wagons.

### THE SHOPPER

*Cartoon by J. E. Whiting  
of the South Bend Tribune.*

A shopper there was and he dared delay  
(Even as you and I)

His Christmas buying full many a day,  
We told him to hasten, to speed on his way  
But the shopper he smiled and he said "Nay,  
nay!"  
(Even as you and I.)

A shopper there was and his clothes were rent  
(Even as you and I.)

'Twas Christmas eve ere he shopping went—  
With the precious moments all but spent,  
But a shopper must follow his natural bent.  
(Even as you and I.)

It isn't a shame and he's to blame  
For the "stinging" so proper and good.  
It was coming to him and we know why  
(And even he may now know why)  
Though he never had understood.

Consumers' leagues, women's clubs, department stores, labor unions, newspapers, street-car companies, poets, cartoonists, salespeople and shoppers all play a part in this philanthropic hue and cry of the holidays.

The central publicity work is done by THE SURVEY'S press bureau in co-operation with the National Consumers' League.

THREE SONS OF DALMATIA

## THE SERVO-CROATS OF MANHATTAN

MARIE SABSOVICH ORENSTEIN

Photographs by Jessie Tarbox Beals

*[From the zadrugas of one of the oldest hill countries of Europe to the co-operative flats of New York's Middle West Side; from the Balkans to Manhattan and back again to take part in the common assault of the allies against the Turks—that is the swing of the human pendulum which we call immigration and the world-wide search for work.]*

*So it is that the campaign of the allies against the Mussulman lifts into timely interest a community of New York freight handlers, who were one of the racial groups studied by the Bureau of Social Research of the New York School of Philanthropy. Mrs. Orenstein made the study of this group as a fellow of the bureau under the immediate supervision of the associate director, Pauline Goldmark.—Ed.]*

**“W**ALK along Eleventh Avenue after working hours and if you can conjure away the ugly, ill-smelling street with the noisy freight trains pulling through it, you may imagine yourself in the old country. All about you, you will hear the ‘Slavish’ tongue spoken.” This was the reply given me as to where his compatriots lived by a Servian business man who had resided fourteen years in the very heart of this Servo-Croatian settlement.

To their neighbors, the Servo-Croats of the Middle West Side are a puzzling group of people, working for the most part on the water front, mingling hardly at all with their neighbors, and commonly known as “Austrians” or “Polacks.” “Who are they?” “Where do they come from?” are the questions asked by almost everybody to whom these people are mentioned. For, though to well-informed Americans, certain Slavic peoples are fairly well-known, as notably Russians and Poles, few, even now when the newspaper headlines are carrying the names of the Balkan allies, can define the racial make-up of a Croat, the political standing of a Bosnian, the national status of a Montenegrin. The origin of these newcomers, their nationality, religion, language and customs are obscure and not understood. We are for the most part in the dark as to what their

relation is to that “most complicated social mosaic of all modern nations, Austria-Hungary.”

This Servo-Croatian colony in New York is situated along Eleventh Avenue from Thirty-fourth to Forty-eighth Streets and on the adjacent cross streets between Tenth and Eleventh Avenues. It is largely concentrated on Eleventh Avenue, where from Fortieth to Forty-sixth Street every tenement house has one or more of these tenants. Most of the Servo-Croatian business establishments are to be found here, and along the water front the men find work. As early as 1888, a small number of Servo-Croats were living on the fringe of the district, West Fifty-ninth, Sixtieth, and Thirty-third Streets. As the colony grew, it gravitated from both ends toward Forty-second Street. From 1904 to 1906 it grew by leaps and bounds, fed by immigrants who crowded into the country in response to the opportunities offered by the era of prosperity. The colony had reached its largest dimensions when the crash of 1907 precipitated a large exodus.

Since our group of Servo-Croats is one which is contributing its quota to the victorious armies, current interest is lent to their relation to the life about them here in the new world, and to the struggle in the old against Mohammedan misrule

on the one hand, and on the other the lust for territory among the great powers.

Perhaps no chapter in the recent history of Austria-Hungary more clearly epitomizes her policy toward the Slavic-Balkan states than that which recites the events leading to the annexation of Bosnia-Herzegovina. Desiring to detach this province from Servia, of which kingdom it had for centuries been a part, the empire sought to secure the aid of Croatia by promising to her the annexation of the coveted territory. Four years of struggle and bloodshed followed. The attitude of many Croats toward this dark period of civil strife is expressed in the words of an immigrant who said: "My reason for coming to America was the fight over Bosnia-Herzegovina. How could I, a Slav, shoot a Servian? We are one people, though now our religions are different. At one time we were all of the *Stara Vëra* [old faith, Greek Orthodox]. To shoot a Schwab [a scornful nickname for Austrians] is another story. They are our enemies, strangers to our blood; how can we side with them!"

### *The Balkan Mosaic*

To understand the racial, cultural and political differences which overlay this common stock, Croats and Serbs, it is necessary to go back to the seventh century settlement of this people on the Balkan peninsula, their present home. The Servians, or Srbin as they called themselves, who were then living among the Carpathian Mountains to the north of the Danube, found themselves hard-pressed by Asiatic hordes, and they moved southward into what was then a depopulated part of the Byzantine empire. That division which settled along the Adriatic slope called themselves after the mountains which had been their home. Carpati, Harvati, Hrvati, Horvats are among the forms their name has assumed. The distinction between these people, known to us as Croats, and the Servians of the more central parts of the peninsula, began to be drawn by early Byzantine chroniclers and was well-established by the twelfth century, though it corresponds to no real linguistic or racial difference.

Distinct religious tenets and frequently opposing political aspirations divide these two groups; for the Servians, settled mostly in the central part of the peninsula, have from the beginning been under the sway of Greek orthodoxy, while the Croats early came under the influence of western culture with its inseparable accompaniment of Roman Catholicism. The Austrian and Magyar rulers, who have imposed their dominion upon these as well as other Slavic peoples, have proved but too skillful in setting brother against brother to their own advantage. The common language, the Servo-Croatian, is a Slavic language derived, with

Russian, Polish, Bulgarian, etc., from a common mother tongue. It has a number of dialects. Croats write in Roman letters, but the Servians employ the Cyrillic alphabet based on the Runic script, which was introduced by Greek orthodox missionaries as far back as the ninth century.

In view of these differences in religious affiliation and in the form adopted for the written language among Servians and Croats, it is worth while perhaps to distinguish even those Balkan countries in which each people predominates. The Servians are to be found largely in Montenegro, Novi Bazar, Turkey, Bosnia, Herzegovina, Servia, and Banat-Batchka; the Croats live mainly along the Adriatic coast in Dalmatia and its islands, Istria, Croatia, Slavonia, and in small settlements elsewhere. The two groups, however, interpenetrate each others' indicated boundaries.

The fact that the Servo-Croats are thus distributed among so many states, distinct not only geographically but politically, inevitably gives rise to confusion unless one bears in mind that all fall in one or the other of the two major groups; and the minor designations, Dalmatians, Istrians, and so forth, have reference to territorial distinction only. The present-day political complexion of these lands—originally independent countries or kingdoms—is indicated in the following summary:

- A. Independent Servo-Croatian lands.
  - Kingdom of Servia,
  - Principality of Montenegro.
- B. Servo-Croatian lands under foreign domination.
  - Bosnia } Austria-Hungary.
  - Herzegovina }
  - Dalmatia } Austria.
  - Istria }
  - Croatia-Slavonia } Hungary.
  - Banat-Batchka }
  - Old Servia—Turkey.

Since two-thirds of these Servo-Croatian lands are under the dominion of Austria, Hungary or the dual monarchy, it is not surprising that their emigrants, in despair of making their race or nationality clear, speak of themselves as simply "Austrians" or "Hungarians."

### *A Man's Colony*

Thus it was that of the 674 individuals included in our West Side study, only six came from Croatia proper and six from Servia. Of the rest 411, or 60 per cent, gave Dalmatia and its islands as their place of nativity; Herzegovina contributed 127; Istria 47; other Balkan states 82; while 42 were born in the United States.

Children or women were scarcely more than incidental factors in the community life stud-

ied. In the early days practically the whole population was composed of men. Not over ten families would have been found fifteen years ago. The entire settlement lived in household groups managed by hired male cooks. But with the increased immigration of 1904 women and children began to come. Yet even now the old residents who place the Servo-Croatian population of the district at 2,500 or 3,000 put the number of families among them at from 150 to 200. Of the households studied 573 individuals; or 85 per cent, were non-family men. Only 25 per cent of the men were married; less than 10 per cent were living with their families, the remainder having left their wives and children in Europe.

The early age at which single men arrive and the scarcity of their countrywomen, the fact that they have come primarily to save money, return to Europe, and there marry; economic stress and the difficulty of supporting a family in this country are the reasons they do not marry here.

Of the entire group 473 or 82.5 per cent, come here between the ages of seventeen and forty-five, when they are of greatest productive and economic value to us. And it was the economic motive which in the answers received from 560 of the 573 men was the predominant one in causing them to emigrate. One man out of ten, to be sure, said he wanted to escape military service, but in half of these cases the desire "to earn" was also given.

The complete absence of political oppression as a cause of emigration among this group of men is not to be inferred from the fact that, (except for the cases in which avoidance of military service was mentioned), its rate was not explicitly stated. Exorbitant taxes everywhere play a special part in making the lot of the agriculturist hard, vying with natural difficulties, such as a sterile soil, fluctuation and instability of crops, and the ravages of phylloxera among the vineyards. Still it is of interest to note that in no case, so far as the writer can recall, was it said that actual hunger or political oppression had threatened the life of a man and driven him to our shores.

Stalwart, powerfully built without being heavy, these men mature early. I saw a boy of thirteen who was as full grown as the average American youth of eighteen years. Of exceptional height were those from Dalmatia, Bosnia, and Herzegovina. "They are among the tallest men of Europe, and not only tall but sturdy and markedly fine in carriage."

Endowed though they are with rugged strength, a few years in America brings unmistakable signs of exhausting, strenuous labor and unsanitary housing. Often did I see men with lined, tired faces, bankrupts in health. Espe-

cially true was it of those who worked at night, for they could not be thoroughly rested by sleeping during the day. "I am always tired when I go to bed and when I get up," complained one tall, wan man. They, as well as others of us, are deeply impressed with the American employer's indifference to the health of his employees.

These Servo-Croats have native intelligence and shrewdness, though little education. Recruited mainly from the peasantry, they are solid rather than stolid. "The Serb, though tenacious of purpose, is not dogged. The surface of his resolutions appears to rise and subside, but the depths are changeless."

These people are liberal borrowers, and because honor has been deeply inbred in them a man feels it incumbent upon himself to make good not only his own, but his father's or brother's debt. It is quite a wonted occurrence for a "greenhorn" to be housed and helped with money by relatives or friends, for as soon as he gets a job he repays them.

Sharing the generic characteristic of all Slavs, credulity lurks somewhere in them, but their long subjection to other rulers than their own has taught them suspicion of outsiders. This distrustfulness they extend to Americans, at whose hands they have, for the most part, suffered exploitation and deceit. When once their confidence is gained, however, they unbend and their hospitality is most liberal and charming. It was in rare instances that in the course of my investigations I was not treated to some drink—the men often running down to get soda water for me—or invited to partake of a meal. "But you have not yet visited with us," said one delightful host. "Your glass is still half-full."

#### *The Drustvo or Co-operative Household*

The households visited have been characterized as groups of non-family men because, barring forty-five, the men whether married or single are living away from their natural families. They dwell, however, in homogeneous groups, coming usually from one town or from neighboring villages, are of the same religious faith, and frequently are related or knew one another before coming to this country. "Well, they are not exactly boarders," said Mrs. — of the six men living with her, "for they are mine and my husband's cousins and nephews." In another household of seven living in co-operative fashion one of the men explained: "We all come from Unie, where we played together as children and knew one another's families well. We would not take in a stranger."

The co-operative household, or *Drustvo*, where common expenditures for living necessities are borne equally by each member of a group prevails among these people. These are of two types

ELBOW-ROOM OF A NEW CONTINENT

Twelve men sleep in two shifts in this room. By day, eight men sleep in the four double beds. Four others turn in in their places at night. Size of room, 12x12x10.

of household—those with and those without a “boss” or “cook” who is usually, though not invariably, hired by the group. Both should be distinguished from the boarding-house. Under the first type, the house boss receives from each member of the group \$2 to \$3 a month, as the case may be, for his labor; that is, cooking, cleaning, and laundry.

The position of the house boss, especially when he is an older man, is frequently that of sage and counselor—who is posted on all the latest doings and gossip in the colony—and of banker as well. The number in each house appears to be limited so the men have that security which is the unfulfilled dream of most wage-earners. “To-morrow never frightens me,” said a grizzly-haired sailor, who had long passed his fiftieth year. “If I do not get along with this crowd there are a half dozen other *Bratstvos* where I would be welcomed.”

When the house boss is a married man, he has a regular occupation and is considered a formal member of the group, contributing his share to the household expenditures. His wife performs the house-boss function, does the house work and thus largely supplements the family income. When there are children they are fed and housed without any extra charge being made to either parent, the group as a whole bearing the expense. This was very pointedly demonstrated in a household where there were four men, besides the house boss, his wife, and four children. “And does the father not pay a little more than the rest of you?” was asked. “No, why should he? Eh, what do the children then eat?”—and in his reply could be detected quite as much amazement at the question as the interrogator felt at the response. The house boss is entrusted with the keeping of accounts. Rent and

service are constant items of expenditure, but of food-stuffs, gas, and coal there must be careful reckoning. The methods of bookkeeping are crude. A grocery book is kept, in which is entered the date, amount, and cost of purchase, and a duplicate account is retained by the grocer or butcher. Coal is also bought on credit. I recall seeing Brakich, shoemaker, stationer, house boss, ice and coal man, all in one, bring a large sack of coal into a flat and then place a cross on the calendar, under the date. The entire group get together on the first of the month; accounts are gone over, verified, and the cost of the food, rent, heat, light, and service equally divided among the regular members.

“And do you not have a great deal of difficulty about getting along in your accounts and payments?” was the question often asked, for on the rock of money disputes many friendships have gone to pieces. With one exception, the reply was always in the negative. As several men explained: “But we are accustomed to co-operative living at home, and it comes quite natural to us even in the new country. Boarding like Americans would be hard. To live in a room you have a clean place, but you come home and four bare walls greet you. You eat, not what you want, but what is given you. It is like prison life, so lonely, so bad. Our way of living is more like home.” The last few phrases strike a chord which shows how deeply ingrained is the feeling for family life among these people.

In the co-operative household without a house boss, we have life on a more truly communistic basis. Not only are the expenses shared in common, but the work of the house is done jointly. Domestic ethics, as established and enforced in some groups, requires that the first man arriving from work cook the supper, others assisting as they come; whoever is finished with the meal begins clearing away the dishes, and thus the rest of the house work is equitably apportioned among the men. Sometimes a man who is more expert in cooking is assigned to do it permanently. The men find that they can manage housework and cooking without difficulty, especially if some are on short night shifts. Surely this manner of living invites even more opportunities for disagreement than the household with a house boss, and yet one youth expressed the general feeling when he said: “Why, how can we quarrel about such things? Are we not all related?”

Such boarding-houses as make up the third type of Servo-Croatian housekeeping arrangements differ little from boarding-houses as we all know them, except perhaps that boarders pay by the month and their laundry is invariably included. The spirit, however, is quite different, for there is a great deal of friendliness and in-

terest among the men in these groups, and between the men and their boarding-house master and mistress.

This mode of living in co-operative households, now very much modified by life and industry in America, and customs and conditions that prevail under a different civilization, must be traced back to the *Zadruga* (literally translated "association"), the communal household or "house community" of the South Slavs, which has been so well described by Professor Balch.<sup>1</sup>

The influence of such community life upon the character of its members was of necessity very marked. There was an absence of petty

The food is nutritious, wholesome, and often very well prepared. "We work hard and must eat well. It is cheaper to spend money this way than give it to the doctor," an astute house boss said to me when I had complimented him on his large, well-browned roast and potatoes. Gala occasions are observed by feasts and then food bills rise 50 to 100 per cent. Frequent comments on the high cost of living were heard.

As compared to other inhabitants of the district, the Servo-Croats pay the lowest per capita room rent but the highest actual rent. Their household groups are far larger than the ordinary tenement family, and they therefore hire

A TYPICAL DRUSTVO WITH MALE HOUSE BOSS

After ten hours' hard work handling freight these men, almost without exception, bathe and don clean clothing before sitting down to their evening meal.

wrangling. Co-operation and toleration have been the heritage of these people for centuries. It is to be regretted if, as they become more Americanized, they lose many of the qualities which are as unique as they are wholesome and charming.

Half of the group interrogated used about one-third of their earnings on bare living. Drinks, which are always taken with meals, are not included in this estimate, for each man buys his own. The wife of a saloon-keeper said that she charged every boarder ten cents a day extra for beer.

<sup>1</sup>Emily Greene Balch: *Our Slavic Fellow Citizens*, page 161. New York, Charities Publication Committee, 1910.

flats with the most room. In several instances a group hire two and three flats to accommodate their members. Most of them were found in the old "railroad" type of tenement, which has more and larger rooms than the dumb-bell type that succeeded it. Overcrowding and the rather unnatural manner of living away from the normal family would make one expect to find dirt and slovenliness running riot in these flats. Yet actual investigation dispels such notions.

Of course, there were households where rough plank benches, a table, and a hot, smoky stove were the only kitchen furnishings; where lines of soiled clothes hung over dreary beds; where

filth and roaches were so rampant that it was appalling to believe that people really lived there. Yet it was surprising how few dirty or untidy homes were seen. Many of the flats were, needless to say, simply furnished, but with few exceptions the American luxuries, stationary washtubs and sinks, were found in every department. In some cases a household had its own toilet.

Many of these people, when in Europe, though accustomed to primitive housing with all of its implied drawbacks, lived in separate houses.

present housing conditions the children of Servo-Croats born here can grow up to be as robust and healthy as their parents.

It would be little short of a miracle if in this day and age so large a group of men, who are either unmarried or living away from their families, should be wholly moral. "Why marry?" said a coarse, handsome fellow. "Today I have an American wife, tomorrow a German, the following day an Irish girl." Many undoubtedly frequent disorderly houses and prostitutes

TYPICAL MIDDLE WEST SIDE TENEMENT STREET

A Sunday afternoon scene on Eleventh Avenue. The store to the left is a pool room, where many seek recreation after the day's work. Both here and in the cigar store some of the men receive their mail and are enlightened on matters purely American.

Some have lived in huts—shared with their goats and chickens—where the windows are "so small that it makes an eclipse of the sun if a hen flies in," but where all day long the men, women, and children could fill their lungs with the fresh air of the fields. In this city the women and children are indoors nearly all day, and although most of the men have open-air employment, life on the streets of New York does not tend to develop the recuperative powers as does life in the open country of Croatia or the flower-covered earth of Istria. All things considered, it seems hardly possible that under

come to them.' At one time certain Croatian saloons kept women.

Men interviewed were always emphatic on the point that the women who cook for households never compromise themselves and are greatly respected. One who never spared his countrymen said he had no objection to his wife and sister sleeping in the same house with a *Drustvo*. If there were one hundred men instead of the actual fourteen, he would have no qualms, "for rough and wild as they are, they will not touch a decent woman, but hold her in esteem." From personal observation, which however was not

very extensive, it would appear that the relations between the women and men in the households are wholesome and friendly.

Many of the men are heavy drinkers, having been accustomed to wine from babyhood. The habit of gambling is steadily gaining upon the colony. Pool rooms and the back rooms of saloons are haunted by gamblers far into the small hours of the morning.

During two or three months of the winter of 1911-12 there was an epidemic of disorderliness. Feuds and quarrels among the Servo-Croats were fought out, particularly on Saturday nights, and saloons and pool rooms were converted into scenes of riot. Firearms were used, and there was danger of the passer-by on the avenue being struck by a stray shot. It developed that there had been great unfriendliness and competition between two saloon keepers and a pool-room keeper whom they were trying to force out of business. This man declared, in reply to a question, that it was not safe to get the law on the trail of his compatriots, for then his life would be endangered. The Croats and others would make his existence burdensome to him. He finally sold his business and moved.

Such incidents must not lead the reader to believe that the general run of men of this colony has become degraded and debauched. There are a great many who, through all the vicissitudes of readjustment to strange and often unfriendly conditions, still preserve their sterling qualities.

In the absence among them of churches, schools and political clubs, the strongest cohesive force in the community life, outside of household ties and the interest in common work, is to be found in the fraternal benefit societies. It is not alone their thrift nor the hazardous nature of their work, which has caused these immigrants to organize strongly and intensively into fraternal benefit societies. As an officer in the National Servian Society explained, the consciousness of kind, which often slumbers on native soil, is aroused among fellow compatriots when they are cast abroad in a strange land. They instinctively strive to join or organize with those who speak their language and have their manner of thought and life.

#### *Freight Handling*

Seventy per cent of the men are employed in freight handling. This is common labor, requiring little experience but a great deal of brawn and strength. Articles weighing one to one and a half tons must at times be pulled and lifted; two men generally handle such cargo. At one time the Irish and Germans handled freight along this water front, but within recent years they have been largely displaced by Italians, by Servo-Croats, and very lately by Bohemian laborers.

Work is organized in gangs of ten or twelve men, and a foreman is put in charge of each

pier. Originally Servo-Croatians worked in homogeneous gangs, but in the notion of their employers "they became too independent and made too many demands." To crush this spirit of rebellion, the gangs were broken up and mixed with men of other nationalities. There were also at one time a number of Croatian foremen, but they did not make good. Hence at present these positions are held almost exclusively by the Irish.

In railroad work one man obtained such a monopoly that through him alone could the Servo-Croats of New York and vicinity get work as freight handlers with the New York Central and West Shore Railroads. During the freight handlers' strike of 1907, he shrewdly saw his opportunity and made overtures to the railroads to furnish them with men. Thereafter he opened an employment office under the guise of conducting an institution of learning. He is an adroit handler of people and as a result of wide advertisement in foreign newspapers and among men of his own nationality, his name and fame have long since traveled across the seas. "When you come to New York, go to Kristic," writes a man in Butte, Mon., to his friend in Dalmatia, "he will find you a job." And so he often does, but the man pays him and pays exceedingly well. In hearings before the Bureau of Licenses there were many complainants to testify that they had been asked from \$5 to \$75 for a job, and had paid fees every time they were discharged and re-employed,—which was frequent.

The question naturally arises why do so many men submit, knowingly, to such exploitation. The explanation is not far to seek. With a standing army of unemployed, the newly-arrived immigrant or jobless man soon realizes how limited is his field and how overcrowded the market. To him it is a God-send to get a job even if he has to pay an exorbitant price to obtain it. "What can a man do when he is out of a job? Run about the streets hungry? He must pay to get work and gives his all, if need be. For where can one get a job without paying for it?" exclaimed one man. On the other hand, railroads need strong, cheap laborers to handle their freight, need them in bulk, on and off. This demand can be satisfied by using immigrant workers and having an extra supply of them within call in reserve. These companies have been able to find a middleman who knows not only how to answer a demand but how to create the need for his services. From his point of view, this middleman reasons it out that if he were unable to satisfy the companies another agent would step in with other laborers. "And why not help my own countrymen?" he says with assumed naïveté.

Outside of railroad work, and of cooking in which nineteen were engaged, individual men are

in divers common employments; 5 per cent are in the building and other trades. Practically every one of these men has served his apprenticeship at freight handling or other rough labor, until by hard striving and aid of friends he has attained the dignity of a trained mechanic.

To be an independent business man is a dizzy height toward which many strive. "When the Slav goes into trade it is generally a round higher up and marks on his part a great rise in the world." There are several Slavic masons and building contractors to be found here. An asbestos manufacturing company, carried on by a Dalmatian, is a very successful enterprise. A number of stationery and tobacco stores, steamship ticket offices, and a barber shop are in the hands of Servo-Croats. Most of their commercial enterprises, however, are groceries and butcher shops—often a combination of the two—saloons and pool rooms. The inclination to emulate the successful saloon and pool-room keepers has been mentioned before. In the course of this inquiry, which occupied some three or four months, two new pool rooms and one new saloon were opened in the district. It takes about \$400 to open a saloon and \$1,200 for a license.

Most of the business men are Dalmatians, though there is a tobacco firm both members of which are Servians. Here tobacco and cigarettes are manufactured as well as sold. One of the partners came to the United States four years ago, and his family followed last year. The wife and, after school hours, the three children work in this store as well as the two men. No outside help is employed. Their merchandise is sold not only in this community but throughout the United States among their compatriots. Another very prosperous Servian has a steamship and railroad ticket office, which has been doing business here for many years. Most of his trade is outside of New York, for through wide advertising in Servian and Croatian papers he receives ticket orders from as far west as Seattle and San Francisco. In addition he has a stationery store and, like a number of business men in the neighborhood, he has leased the entire tenement in which his business is located, using it as a lodging-house for incoming and departing immigrants. These business men depend upon their countrymen for most of their trade. They frequently sustain large losses, for they have a poor system of bookkeeping and most of the transactions are on a credit basis.

As in all foreign communities, the business men are the brains of the group and lead the rest. A few of them are good neighborly men, who aid their countrymen with advice and money, without charging interest. Two saloon-keepers were often mentioned as the kindest, most helpful and best men in the colony. As Professor Balch has written: "The saloon-keeper

of a Slavic group may be the best man in it; he is at least very likely to be the most influential."

It is but logical to expect that the more these immigrants become acclimatized, acquainted with our ways and means of living and working, the better able they are to earn a higher wage. Yet if they do forge ahead it is almost in spite of us, for we meet them but half way and that reluctantly or because of financial motives.

This colony, like a circle within a circle, has not touched the life of the district and has not perceptibly reacted to any positive influences of social agencies in the neighborhood. In fact, each circle has a very hazy notion, if any at all, of the other's existence. When I took three little Croatian girls to a settlement house which is about four blocks from their home, a resident of long standing was surprised to hear that there was an "Austrian" colony nearby. The settlement had never had "Austrian" children in its clubs. The district Charity Organization Society office has never had an applicant from among these people, who themselves care for their compatriots in distress. As a matter of fact, there is little actual poverty and hunger among them. Though a large proportion of them are Roman Catholics, apparently the churches have not put forth much endeavor to get them within their fold. Only in a few rare instances were the neighborhood churches mentioned by the men.

Children go to the public schools but not more than a dozen men have attended evening classes. Some have said, "We come here to make money, not to go to school," and others again get home from their work late, or work at night, and are too tired for mental exertion, even if they have the desire. Taking into consideration that the great majority of these men work, live, and deal with compatriots, and hence do not feel the vital need to learn the language, it is surprising to find that no less than 311, or 54.3 per cent, can make themselves understood in English. A few read our newspapers and write the language.

Agencies outside of the district are in the nature of things unknown to this colony. Very few Balkan people come to the Information Division of the Department of Commerce and Labor, whose object is to find employment outside of New York for men, particularly foreigners. Chief C. L. Green attributes this to two causes: that the men do not want to go out of the city and that the division is not advertised in Servo-Croatian newspapers. It is the policy of the division to get space gratis in papers, and some Servo-Croatian editors have refused to give it without pay.

This failure to advertise in the Servo-Croatian papers is the more regrettable as free use of

**A HERZEGOVINIAN**

For ten hours a night he pulls trucks on a New York freight pier.

this agency by men needing work might serve to lessen their dependence on the boss above mentioned and help to break up the evil influence of this man on the life of the community. For not only does he drain the pocketbooks of his countrymen but he is one of the strong retarding factors in the Americanization of these people. He is the direct link between Europe and America to a vast number of these men, and stands as a buffer between them and Americanizing influences. He stands without a rival as the most influential and powerful man in this Servo-Croatian settlement.

A few men have become naturalized because they see an economic advantage in such a step. There are in this group ten citizens, and twelve who have their first papers, a total of twenty-two, or 19 per cent of the 115 men who have been in this country five years or more and are eligible to take one or both steps in the process of naturalization. For many do not look upon America as a place of permanent residence; others find the ways and means of acquiring citizenship incomprehensible or onerous. It is difficult to get witnesses and take the time to appear before the judge. A number of the younger men, however, expressed their intention to become citizens.

These people generally distrust American banks, and even if they have faith in them there are the practical difficulties of making themselves understood and of getting to the bank before the closing hours. Private bankers, especially of their own nationality, were at one time almost exclusively used, both as trustees of their savings and as channels of remittances; but so many frauds were perpetrated upon these ignorant, trusting aliens, reaching their climax

"MAMMA LAYO"

Who feeds and rules a household of forty men.

in the absconding of Frank Zotti, that now most of the money is remitted through the postoffice or reputable banking firms, and men more rarely deposit with small bankers.

There are a number of reasons which preclude the men from investing their money in this country. Most of them are recent immigrants of less than five years' standing; a large number expect eventually to settle in Europe, and hence have not severed business connection there. Furthermore, property in and about New York is unapproachably costly and forbidding, and opportunities at a distance are little known to them.

Again and again the cry is raised that these immigrants will not assimilate. Pray what have we done to inspire them with our civic ideals? What have we done to teach them? For this particular group there stand Tammany Hall and lesser preceptors in politics, who hold behind them an ever-ready and open palm for tips; among their Americanized countrymen many either alienate themselves or defraud them; unscrupulous American employers exploit them, control their waking hours, living conditions and chance of advancement. How can these foreigners become imbued with American civic and social ideals?

Neighborhood agencies have not gone half way to meet them. They do not come into close contact with Americans in their work or homes, hence why should they be acquainted with American institutions or adopt American standards? Thus the fault lies quite as much with us as with them. They are isolated, cut off, and we have failed to do the minimum which the most elementary ethics of civilization demand of us.

## NORWOOD AND OAKLEY<sup>1</sup>

HOW CINCINNATI FACTORIES HAVE TURNED TWO RESIDENTIAL SUBURBS  
TOPSY-TURVY

*[This is the third of the series of articles by Mr. Taylor on the "satellite cities" which industry is creating under the eaves of our great urban centers. In November, Pullman, the works-suburb of the 80's, was described; in January, Gary, the newest and largest, will be discussed. This community study deals not so much with the separate suburban community as with that constant offshooting of factories to the city's edge which in bulk and social consequences transcends the more spectacular company towns.—Ed.]*

THE SUBURBANITE who leaves business behind at nightfall for the cool green rim of the city would think the world had gone topsy-turvy if at 5:30 he rushed out of a factory set in a landscape of open fields and wooded hill-sides, scrambled for a seat in a street-car or grimy train and clattered back to the region of brick and pavement, of soot and noise and jostle. This is daily routine nonetheless for many thousands of factory workers.

The average American factory moves to the edge of the city when the old quarters become too small for the expanding business of the concern, depends upon traction to bring the old employes to its doors, and such housing as may develop in the vicinity of the new location is usually left to the uncontrolled and haphazard enterprise of real estate promoters.

This trend is not spectacular, but in volume and human consequences it is worth perhaps more attention than the separate and more conspicuous "model towns." Yet the removal of industries to the outskirts is ordinarily gradual and piecemeal, and often escapes public notice until

the chance for rational guidance from the standpoint of community efficiency has all but gone.

The environs of Cincinnati present unusual examples of this shift of factories from city to suburb. The most widely known is the large soap factory of the Proctor & Gamble Company. Ivorydale, however, is chiefly noted for its profit-sharing schemes rather than for housing and community developments, and yields place in this study of the industrial satellites of Cincinnati to Norwood and Oakley which adjoin each other on the city's northeastern edge.

Starting as residential suburbs of the usual type, their shaded streets have been outflanked by a cordon of big factories stretching along the line of the Baltimore and Ohio Railroad. Most of these plants have emigrated from Cincinnati's center.

It was little more than a decade ago that a town chronicler hailed Norwood as "Gem of the Highlands, the brightest jewel in Cincinnati's sylvan crown." At a recent legislative hearing in Columbus she had become, in the words of her spokesman, "the Chicago of Hamilton County."

<sup>1</sup>Previous articles in this series were: I. The Outer Rings of Industry, October 5; II. Pullman, November 2.

According to a federal census summary for 1909, Norwood boasted forty-nine manufacturing establishments capitalized at \$13,368,000 with an annual product worth nearly \$10,000,000. Among the larger plants are those of the Bullock Electric Works of the Allis-Chalmers Company which, in 1898, was the first to move out from Cincinnati; the United States Playing Card Company; the Weir Frog Company; and the Globe-Wernicke Company which, in 1900, located on twenty acres of cornfields.

Development in Oakley is yet more recent. In 1907 a "Factory Colony" seized upon land previously occupied by four dairies. Of these half dozen plants each not only gained for itself many advantages they had not had in their old quarters in congested Cincinnati, but set up co-operative additional ones to be used in common.

"Town booming" methods often employed by citizens and officials to coax industries to new communities were entirely lacking at Norwood. Indeed, the factories encountered local indifference and even antagonism. Many citizens feared that the residential character of the place would be jeopardized. Real estate men made no effort to build houses and flats within the means of factory workers; there was larger and surer profit in residences for Cincinnati business men. The consequence is that, although a dozen years have elapsed since the factories began to move out and although Norwood has grown from 6,480 in 1900 to 16,185 in 1910, a comparatively small proportion of the operatives live in the vicinity

of the factories. The increase in residents has been mostly in suburbanites with business in Cincinnati.

*Commuting Other End To*

An analysis of where Norwood and Oakley factory workers live and even a superficial study of their transportation to and from work indicates a situation of peculiar interest from the point of view of the increasing number of civic experts who believe in "walking to your work." They hold that with all our emphasis on development of rapid transit as a means of lessening congestion, we must also approach the problem from the other side, and seek scientifically to reduce the need for traction through city planning which shall enable more people to live as neighbors to their livelihood.

Less than one-third of the operatives in Norwood and Oakley factories live within easy walking distance of their work. The great majority of those who must depend on traction facilities ride out from more or less congested parts of central Cincinnati. Some others even live in Kentucky, and thus, after journeying to and across the Ohio River, have then to traverse the city itself from boundary to boundary in order to reach their employment.

Data supplied by five of the larger Norwood factories and by the largest Oakley factory, involving nearly 4,500 workers, we may fairly assume to be representative of the total number of workers, about 10,000. It shows roughly, as

**WHERE NORWOOD AND OAKLEY SUB-URBAN WORKERS LIVE**

The data charted concerns nearly five thousand persons employed in six factories and may be taken as representative of the total number—perhaps twice that. Nearly half, 44.68 per cent, live in tenements or thickly populated parts of central Cincinnati, over five miles from their work; about five hundred even live across the river in Kentucky; while less than one-third, 31.28 per cent, live in Norwood and Oakley.

Chart by George Wallace Carr

indicated by the map on another page, that these workers live:

<i>Down Town Cincinnati</i>	
West End, East End and other tenement and crowded parts. Other parts near city's center	44.68
<i>Industrial Sections in Northwest Part of Cincinnati,</i>	
Cumminsville, St. Bernard and other sections	6.00
<i>Kentucky,</i>	
Covington, Newport and scattering.....	4.96
<i>Country Towns.....</i>	5.95
<i>Norwood and Oakley.....</i>	31.28
<i>Vicinity of Norwood and Oakley,</i>	
Hyde Park, Madisonville, Evanston and other neighborhoods both in and out of Cincinnati, some just inside and some just beyond the Cincinnati city limits.....	7.13

Only those in the above list who live in Norwood and Oakley, and some of those in nearby neighborhoods, are within easy walking distance of the factories.

This dislocation of the normal routine of factory and home involves several problems. There

States Playing Card Company, for example, which employs a large number of girls, carried them in omnibuses between the end of the Norwood street-car line and the factory door when the weather was bad.

Several factory managers united in prevailing upon the Baltimore and Ohio to run a Factory Special. This they were able to secure at the outset only by guaranteeing to make good any deficit between receipts and cost of operation. A five cent fare was arranged, commutation tickets, twenty rides for a dollar, being bought by the factory managements in sufficient quantity to safeguard the railroad from loss. These they resold to their employees.

Today a ten-car train which starts almost empty when it leaves the Central Union Depot picks up its load at the stations at Eighth street, Brighton and the Stock Yards, which tap the

THE FACTORY SPECIAL

Arranged for by several factory managers, a ten-car train takes operatives from Cincinnati out to suburban factories at Norwood and Oakley each morning and back to Cincinnati each evening.

is the need for travel and its curtailment of leisure and income; there are luncheons to be got by thousands of employes at a distance from home and the customary city facilities; there are less tangible effects on the permanency of the working force and their isolation from their fellows.

For the hauling of raw material and the shipping of finished product, the Baltimore and Ohio Railroad offered the same freight rates as for Cincinnati. Shipping facilities were a large factor in the location of plants at Norwood and Oakley. But the means for transporting the human working force to the spot where the raw material should be transformed into finished product was not so ready at hand. In some instances only persistent efforts by plant superintendents secured extensions of street-car lines all the way out to the factories. Meanwhile, make-shifts were sometimes necessary. The United

tenement districts of Cincinnati's West Side. Then, four miles out, at Cumminsville and St. Bernard, it gathers up others from regions of cheap, though not squalid, housing. With every seat taken, and aisles and platforms crowded, it travels on to the unloading stations, Norwood, East Norwood and Oakley. Oakley, nearly twelve miles from the Central Union Depot, is reached in about forty-five minutes. Leaving Oakley and Norwood at 5:45 each evening it drops its load at the various points along the line back to the Central Union Depot in Cincinnati where it arrives at 6:25 P. M. The service is not bad except for the insufficient number of seats during that portion of the trip in which the maximum load is carried.

'The few Norwood and Oakley factory operatives who live in the country towns to the northwest are served by the Baltimore and Ohio, by two interurban lines and by the Cincinnati, Lebanon and Northern. The latter also carries some traffic out from its Cincinnati station on the edge of the central business district.

Street-cars, however, afford the principal traction service between downtown Cincinnati and Norwood and Oakley. The trip, which takes twelve or fifteen minutes in the automobile of a factory official, requires from thirty-five to fifty minutes and longer for the factory worker who rides first on one line and then transfers. A five-cent fare covers the entire tributary area except

crush is still further distributed by the fact that two hundred girls under eighteen years of age, and hence protected by the Ohio eight-hour law, leave work at 3:45. Other plants, employing comparatively few women, allow them to leave earlier than the men. But the latter, quitting all together, make a sudden and heavy demand on the street-car facilities.

#### THE FACTORY SHIFT FROM CITY CENTER TO SUBURB

The first great gain: light, air, room and sanitation for the factory worker and a chance for future industrial expansion. When will civic and community planning do as much for the workers' homes?

Above, the United States Playing Card Company.  
Below, the Globe-Wernicke Company.

Kentucky. The street-car company arranges to have several empty cars waiting near each factory at closing time. The rush for seats is partly due no doubt to the preference of many to take standing room on the first few cars rather than wait for a seat in the cars behind. But even the latter are usually filled beyond their seating capacity. It illustrates the ingenuity which has had to be applied to make the whole inverted arrangement workable that the Playing Card factory arranges for half of their seven hundred girl employees to start and quit work a quarter of an hour earlier than the other half. The afternoon

#### *Some Social Aspects of the Transit Problem*

The car lines to Norwood and Oakley appear like a traction bonanza, with their full hauls both ways. The same cars which carry factory workers out at 7:30 each morning are loaded on the way back with Cincinnati office workers going into the city. The reverse happens each afternoon.

But car fares figure on the other side of the ledger for the workers. Sixty cents a week is 10 per cent of the \$6 average wage of girls who work in some Norwood factories.

The situation has thus brought other social problems for managers and work-people than the sheer one of human freightage. The willingness of employes to make the long trip twice a day was problematical. Yet so far from discouraging employes from sticking to their jobs, the removal to the outskirts has been followed, most managers declare, by a longer average job tenure

LUNCHES AT NORWOOD WHEREVER THE WORKER CAN FIND A PLACE TO EAT THEM

than was the case in Cincinnati. One manager said that although the well-lighted, ventilated, clean and roomy workshops are an appreciated advantage, an important factor is that workers have less opportunity to learn of new jobs involving real or fancied betterment. Their contact with workers in other factories, with whom they might compare work conditions and wages, is much less frequent. At noon hours and on the way to and from work they are now thrown only with those employed in the same factory with themselves, or else those employed in nearby factories whose work involves a different trade. In this connection it would be interesting to know whether the evident success of employers in keeping trade unionism at a low ebb in most of the Norwood and Oakley factories is due in part to this isolation of the workers from fellow-workers and trade union representatives in the same industry. It is possible to discover not a little discontent among work-people in various plants. The employment by one plant of some Negroes and "Hunkies" is cited by other employes as an effort to cut under the wage standards demanded by "white men."

The longer journey to and from work seems to have necessitated no reduction in work hours in order to hold employes. Most of the plants run fifty-five hours a week, 7 A. M. to 5:30 P. M.

each day except Saturday, when quitting time is at noon. The several hundred girls at the United States Playing Card plant work, as has been noted, a forty-eight or forty-nine hour week. Those who tried to get the Ohio legislature to pass an eight-hour law for women's work were disappointed when the Playing Card Company, which provides excellent shop conditions, lined up with other manufacturers against any restrictions whatever. Incidentally, it is significant that in this plant 900 employes now turn out as large a product as 1,400 did a few years ago. This is, no doubt, due partly to new labor-saving machinery, but good work conditions are, doubtless, partly responsible. The plant management considers the main factor to be a premium and bonus system in connection with wage payments. This has meant somewhat higher wages, the premiums and bonuses being 10 per cent of the total pay roll expenditure last year.

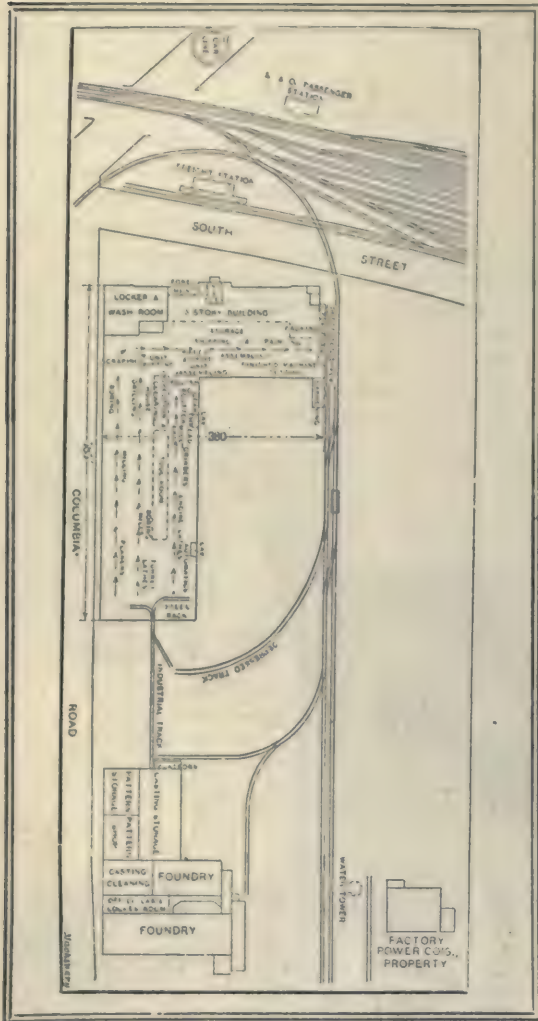

Comparatively few operatives live near enough to go home for lunch, and facilities in the vicinity of the plants are meager and mediocre. Some of the plants have established lunch rooms. One, which conducts an unusually good one, reports that it does

so at a considerable annual loss. Some do not sell food; but merely provide a place where lunches which are brought may be eaten, while others make provision only for the office force. But in most cases a work-bench, curb-stone, door-step or nearest grassy spot must accommodate those who eat at the works, while several cheap and not very clean looking saloons and "eating joints" serve crowds of others.

None of the plants found it necessary to increase wages on account of removal from downtown Cincinnati except the United States Playing Card Company. The comparatively small wages

of its many girl employes were advanced 20 per cent at the time of removal. Many of the employes paid carfare to reach their work when the factories were located in Cincinnati, so that the trip to Norwood, even if it does mean a longer street-car ride, does not involve added expense.

With these things in mind why is it that Norwood and Oakley are not more largely peopled by the workers in their factories? Here are work opportunities, suburban surroundings usually coveted by city dwellers, and a long trip to and from work to be rid of. Why do so many of these workers continue to crowd into Cincinnati tenements? The usual answer one gets is that many Norwood and Oakley workers are members of families whose main bread-winners work in the factory center of Cincinnati and therefore want to continue to live near it. Or, it is said, that they like the bright lights and excitement of the big city. These do not seem adequate explanations. Other cities have downtown factory workers who live on the outskirts even without the inducement of suburban employment; and other small communities have provided sufficient zest in neighborhood and town life to interest the people who dwell there.

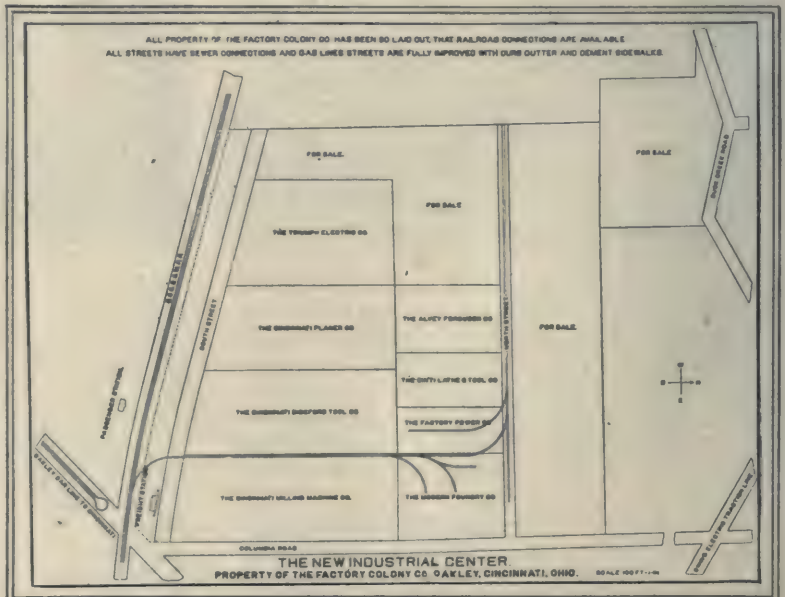

We may inquire, therefore, what efforts have been made to adapt this suburban area to the needs of the people brought together by its industries. If modern science and technical ability secured the highest degree of efficiency in plant arrangement and construction, were similar skill and ingenuity applied to the community life, to town planning, housing, health and recreation?

### A Well-Planned "Factory Colony"

As an example of foresight and efficiency in planning for manufacturing, the "factory

### THE "FACTORY COLONY"

Effective factory planning that makes sharp contrast with the lack of planning for the community life. Above, routing from raw material to finished product in the Cincinnati Milling Machine Company's plant. To the right, the "factory colony" at Oakley, a significant instance of the co-operative advantages in factory grouping. Common power plant and foundry serve all.

THE CINCINNATI MILLING MACHINE COMPANY'S PLANT AND OTHER FACTORIES IN THE FACTORY COLONY AT OAKLEY. THIS COMPANY PLANNED THE COLONY

colony" at Oakley is notable. There was little concerted action in the industrial development at Norwood. One factory after another decided to locate there. But Oakley has exhibited in remarkable degree the advantages which come through co-operation.

When the Cincinnati Milling Machine Company, in 1906, sought a new site away from Cincinnati's congestion, it found at Oakley some property used only for dairy and truck-gardening purposes. The area was more than the company needed, and its charter did not permit it to deal in real estate. Accordingly, it interested several other factory managements in the organization of the Factory Colony Company. Space has been apportioned on the basis of "first come, first served," and at this writing six plants have been built. Five moved out from Cincinnati, and one came from Louisville. The scheme has gone further and developed common means for supplying common needs through the organization of the Factory Power Company and the Modern Foundry Company, both owned by the group of factories and operated at cost. In the power company each factory has an interest proportionate to the service secured. This includes power, light, heat, water supply, compressed air, steam and pressure for sprinkler systems for fire protection. What this means in economy may be gauged from the fact that one of the plants now gets power at one and one-half cents per kilowatt hour. In its old location in Cincinnati it paid three cents. The power plant is laid out for a capacity of more than four times the present installation.

The Modern Foundry Company in a similar way serves the needs of the various plants. Through the specifications agreed upon for the construction of all the factory buildings, and through such other uniform conditions as the provision of a sprinkler system, insurance costs have been reduced to about one-tenth of what was paid on the old plants in Cincinnati.

### *An Unplanned Human Colony*

Compared with this thought-out, ship-shape, craftsman-like development of equipment to meet the common needs of these various manufacturing, town planning to meet the common needs of the people who man them, or the lack of it, in Norwood and Oakley presents a marked contrast. Only the scantiest attention has been given to it, even when the arrival of industries seemed to assure rapid town growth. Irregular farm boundaries had been allowed arbitrarily to determine streets and lines of growth. Large areas owned by one man and his heirs, and held vacant for speculation, have hampered development. Subdivisions have been laid out without any reference to each other, and the whole arrangement of the town had the appearance of a "crazy quilt," to quote the chairman of a platting commission which was established as early as 1889.

Through the commission's efforts a few streets were straightened, widened or vacated, and new ones platted with some reference to a general plan. But the lack of authority to cope adequately with the situation led this same man to declare that only "sweeping power" given to a county platting commission could protect the generations that are to follow against the selfishness of those bent on reaping profits from land regardless of the welfare of others—a remark well-nigh prophetic of the spirit which gave England a town planning act in 1909,<sup>1</sup> and which yet must be awakened in America if our cities are to have real opportunity to guide their suburban development.

This warning of nearly twenty years ago seems never to have been heeded. Subdivisions are still laid out in Norwood and Oakley in any way that suits the owner, provided the directions and

<sup>1</sup>The Province of Ontario has enacted a town planning act on lines similar to those of the British act, except that a rather large minimum street width is required. No state or city of the United States, however, has yet enacted any thorough-going legislation of this sort.

widths of streets in the older adjoining subdivision are followed. Size of lots, building lines, and other important features are subject in no way to public control, but are at the mercy of special interest or civic stupidity. A far-sighted view of community development is entirely lacking.

This is indicated, for example, by the lot widths. In older subdivisions these are fifty feet; in later ones thirty to forty-five feet; and in those most recently platted, twenty-five feet. This is not necessarily an evil. If a width of twenty-five feet is adopted with a view to scientific house grouping<sup>1</sup> it may even be eminently wise. But the crowded parts of many of our large cities will show what miserable congestion may develop on narrow lots when no adequate building restrictions are provided. In Norwood, narrow and narrower lot platting has simply followed on the heels of the growth in population because large profits could be gotten from cutting a given piece of property into more lots.

Similarly, scientific planning of street paving widths on a basis of street function, which has meant a difference of a shilling a week rent on each house in some English garden suburbs, is as little understood and applied in Norwood as it is in the average residential subdivision of our large cities.<sup>2</sup>

Most of the industrial plants which stretch along the outer edge of Norwood and Oakley have space enough for years of expansion. Ordinary business foresight took care of this. The land owned by the factories, both that already occupied and that held vacant for future needs, is worth now about \$4,000 an acre, according to estimates based on the Norwood appraisements of 1910 and the opinions of real estate men. One of the most favorably located of these factory sites cost, says the president of the concern owning it, \$1,000 an acre in 1900. This would indicate that land values in the neighborhood of the factories have advanced 400 per cent in the twelve years since the factories began to move out to Norwood.

The abode of industry was thus assured when land was cheap. Similar assurance for homes for the workers away from congested Cincinnati was nobody's concern. Blame cannot fairly be heaped upon plant managers for this lack of civic and social foresight in the industrial shift from city center to suburb. The problems connected with the removal of the plants themselves were doubtless complicated and engrossing enough to monopolize their attention. There was not the clear responsibility which rests on the single industrial establishment which builds a town for its sole occupancy. Such experiences as those

of Pullman have made industrial leaders hesitant to embark on social and civic experimentation further than the effective manning of their plants demands. The situation lays bare the need for civic leaders of larger vision than those of twelve years ago—for a "city-zen-ship" that shall be statesmanship and shall give community affairs the same degree of thought and foresight and constructive genius which the ablest men devote to private enterprise.

### *The Economic Underpinnings*

To afford a basis by which we may gauge the living opportunities which Norwood and Oakley offer their factory workers we must first know the extent of income from which rent and living costs must be paid.

According to federal census figures for 1909, Norwood factories had 507 salaried employes, and 3,907, wage-earners. The salaried employes earned \$632,000, or an average of \$1,246.55 a year. The wage-earners received in a year \$2,081,000, or an average of \$532.53 each. This amounts to an average weekly wage of \$10.24 which probably has risen in some degree since 1909. The large number of girl employes at low wages—the seven hundred at the United States Playing Card plant earn at the present time an average of \$6 a week each—tends to make the general average lower than the average amount received by the heads of families. Let us turn, therefore, to two large plants employing almost wholly men. One is in Norwood and the other in Oakley, and each employes nearly 1,000 men.

#### PLANT NO. 1. MEN.

WEEKLY EARNINGS OF SHOP EMPLOYEES.			
21.88	per cent	earn	under \$10 a week
52.69	"	"	from \$10 to \$15 a week
24.86	"	"	from \$15 to \$20 " "
.57	"	"	over \$20 a week

#### PLANT NO. 2. MEN.

WEEKLY EARNINGS OF SHOP EMPLOYEES.			
39.54	per cent	earn	under \$10 a week
40.63	"	"	from \$10 to \$15 a week
16.86	"	"	from \$15 to \$20 " "
2.97	"	"	over \$20 a week

Both of these factories employ principally skilled operatives. It will be seen that roughly a quarter of these workmen earn \$10 or under per week and that three-quarters earn an average of \$15 or less.

The cheapest housing accommodations in Norwood are three-room flats, varying from \$12 to \$20 per month according to location and convenience. A real estate agent of many years' experience in Norwood roughly classified the town's housing as follows:

#### RENTS IN NORWOOD

				\$12	to	\$20	per month
2000	three-room	flats	at	\$12	to	\$20	per month
1200	four	"	"	\$15	"	\$25	" "
800	five	"	"	\$20	"	\$40	" "
500	"	houses	"	\$20	"	\$25	" "
500	six	"	"	\$25	"	\$32	" "
800	seven	"	"	\$30	"	\$35	" "
600	eight	"	"	\$35	"	\$50	" "

<sup>1</sup>See *Scribner's Magazine*, July, 1912. *Model Towns in America*, by Grosvenor Atterbury.

<sup>2</sup>See *Width and Arrangement of Streets*, by Charles Mulford Robinson, published by the *Engineering News*. Price \$2.

These figures were shown to a well-known Norwood citizen and thought by him to be much lower than the facts would show, particularly so far as three-, four- and five-room flats are concerned. But, taking them as they stand, they show that the cheapest three-room flats cost approximately one-quarter of the income of a \$12-a-week wage-earner, while if he desires more than three rooms for his family the expense rises far above that proportion. Many families, of course, have more than one wage-earner, thus swelling the family income, but that fact makes it no easier for the head of a family in which the children are all young or going to school.

Ownership of houses in the suburbs near their work is even more impossible for the Norwood and Oakley employes. From the standpoint of risk in home ownership, they, to be sure, present

case \$2,250 is borrowed from a building loan association to be paid back with interest in installments of \$21 per month. In addition, a cash payment of \$500 goes at the outset to the builder of the house, who carries on credit the remaining \$750. This is paid in monthly installments of from \$15 to \$20. Thus, \$500 down and \$36 a month is the cheapest rate at which, under present conditions, houses may be purchased. Almost none of these houses are bought by employes of Norwood factories. A Cincinnati builder recently put up twenty-seven houses in Norwood, but not one was for a Norwood factory employe.

The situation at Oakley is practically the same, \$300 to \$500 down, and \$30 monthly on the principal with interest at 6 per cent being necessary to secure a six-room house, costing with land about \$3,600. In many cases these houses both in Norwood and Oakley are arranged for

THE TENEMENT REGION OF CINCINNATI

Almost half the workers in the factories of Norwood and Oakley live in the crowded, noisy city and work in the quiet, open suburbs.

a safer proposition than do most industrial towns, for there is a diversity of industries, and employment is not solely dependent upon the ups and downs of one business. Work seems to be comparatively steady rather than subject to the extremes of dull and heavy seasons as in the steel industry. And furthermore, the bulk of Cincinnati industries are near enough so that in case of lack of employment in Norwood or Oakley, a worker living in the suburb has recourse to whatever opportunities for work the larger city affords. It is the fact that, despite the factory growth, Norwood and Oakley have developed as residential suburbs for Cincinnati's business and salaried men to an extent that has put home ownership there beyond the reach of the average workingman.

Under present building operations in Norwood the minimum cost of a small home is about \$3,500, of which \$700 or \$800 represents cost of a lot with thirty-five feet frontage. In a typical

the occupancy of two families, the owner living in one flat and renting the other.

Nor is an extensive housing scheme now being carried out in Oakley enabling workmen in Oakley factories to live in the suburb as seems to be the current impression in Cincinnati. When the factories moved to Oakley in 1907, a tract of 110 acres—the old Oakley race track property which had fallen into disuse owing to adverse racing legislation in Ohio—was secured by the Oakley Park Company. It has built and sold about 150 houses in the last three years, but of these fewer than ten were purchased by employes of the Oakley plants. The agent frankly states that he is making no effort to interest factory employes since their wages are too low to permit them to occupy houses of the type built. Most of the house purchasers are Cincinnati salaried men who occupy half the house and rent the other half. On the thus far undeveloped property of the Oakley Park Com-

pany, extending almost to the gates of the Oakley factories, there is room for about five hundred more houses. The amazing unintelligence and cumbersomeness of our civic development is apparent in the fact that if present building plans are continued, these will afford practically no accommodations for the men and women who go to work there. They must continue, many of them, to dwell far away in congested Cincinnati, while workers in Cincinnati dwell in Oakley.

#### *The Schmidlapp Housing Experiment*

The failure of housing developments in Nor-

either suburb. Unfortunately each house is exactly like every other house in the solid rows of brick, and one fears that a few years of deterioration will make them almost as dismal as the city tenement. With exception of the end houses in each group, light and air is obtained only at front and rear.

One group contains nine houses, each having two apartments of four rooms. These rent for \$3.75 a week in the end houses and \$3.25 a week in the others. Some of the inside houses have three-room apartments at \$2.25 a week. Each apartment has a bathroom and at the rear an

ACRES OF LAND NEIGHBORING THE OAKLEY FACTORIES, WHICH ARE BEING DEVELOPED FOR COMMUTERS AND NOT FOR FACTORY EMPLOYEES

wood and Oakley to meet the needs of the factory workers has been recognized in the efforts of one Cincinnati man, J. G. Schmidlapp. He is following in the lines of the Washington (D. C.) Sanitary Improvement Company, which, in the last fifteen years, has invested nearly \$1,000,000 and erected 289 houses accommodating 578 families, yielding 5 per cent annual return on \$500,000 capital stock and earning a considerable annual surplus.

Mr. Schmidlapp has built two groups of workmen's houses in Norwood, and one group in Oakley. These provide sanitary dwellings at a rent considerably lower than that prevailing in

outside porch. Rents in another group of fourteen houses are slightly higher owing to the provision of cellars. The cost is approximately \$3,000 per house including land. In the policy of administration 5 per cent is allowed for return on the investment, and 4 per cent for expenses and depreciation. Among 104 applicants for apartments in the two groups of houses in Norwood, seventy-five were already living in Norwood, seventeen were living in other nearby cities, and twelve were living in Cincinnati. This would seem discouraging from the standpoint of inviting people away from congested areas, but the natural explanation given is that dwellers in

Norwood had become familiar with the houses during construction and were eager to avail themselves of accommodations much less expensive than those they had been occupying.

The most distinctive feature of Mr. Schmidlapp's plan—and the phase of it which will be watched with greatest interest—is his method of selling a two-family house to a wage-earner. He hopes that the income from renting half the house will enable a workman to buy his home when he could not afford to buy a one-family house.

The building expense of a double house is of course less than twice the expense of a detached dwelling; the land area and taxes are also less; the workman who takes up the proposition spends time and interest in keeping the property in good condition and keeping it rented; and gets for his pains the profits in rentals and increased land values on the extra half of his property which would otherwise go to a real estate company or large investor. In other words Mr. Schmidlapp hopes to change workmen from renters to home owners by getting them the benefits of one-ply landlords in the process. The plan he, doubtless, feels will increase the number of citizens whose property gives them a conservative interest and permanent stake in the community. He believes that he can turn over a two-family house, after payments of about ten years, on the following basis:

House having 2 three-room apartments, \$100 cash and \$4.50 weekly.

House having 2 four-room apartments, \$200 cash and \$5.00 weekly.

House having 2 five-room apartments, \$300 cash and \$5.50 weekly.

The original deposit is to be returned in case of death or in case of disability compelling purchaser to give up his contract, when such disability is not the fault of the purchaser.

These "philanthropy and 5 per cent" enterprises are being watched with considerable interest by real estate men in Cincinnati and vicinity. Those in Norwood and Oakley, how-

ever, have thus far shown no disposition to undertake similar developments, and the higher profits to be made in building homes for Cincinnati business and salaried men will likely monopolize their attention in any event. Mr. Schmidlapp's influence will count for most in demonstrating the possibilities of safe long term investment in the housing field by the executors of estates and other trust funds. Local builders have yet to be convinced that the scheme is practicable; and some of them express their opinion that it will make factory superintendents complacent in paying wages no higher than at present, and perhaps even lower, in the belief that a working man will now have an opportunity to secure housing at low rentals. These critics, admitting that their contention is sound, perhaps, lose sight of the fact that even if many more groups of houses are built by Mr. Schmidlapp, they can accommodate only a very small proportion of the total working force at Norwood and Oakley.

Social observers appreciate the value of his effort to provide thoroughly sanitary homes at a minimum of expense. One could wish, however, that even without reaching so low a rental figure, more pains had been taken to avoid a barracks-like monotony of structure. It is encouraging to know that his plans for the future promise more attractive dwellings, another step in advance. The English garden suburbs, and some developments in this country as well, go to show that it is possible to provide infinitely more attractive homes at very slightly higher cost. If wages reasonably within reach of the average workman are not sufficient to support a reasonable standard of comfort and charm in the home life of the people, the task of lowering the household standard to meet the wage scale may be a bottomless process; and constructive philanthropy could better apply itself to bringing up wage scales to a point where normal household life can be ob-

This work has borne an important relation to the development of industrial education in Cincinnati.

SCHMIDLAPP HOUSES—FRONT VIEW

tained under modern conditions. Given normal standards in house construction, the man who applies business acumen, the methods of large scale construction and the gains of interest and increased land values to bring them within the reach of the average worker and lessen their strain on his household budget is doing a large public service.

There is a general complaint that food costs as well as rent seem to be high in these suburbs in comparison with Cincinnati and even in comparison with other suburbs. A study of the prices at four grocery stores—one in Norwood, one middle-class store in Cincinnati, one near the public market in Cincinnati, and one conducted by a firm which operates many stores in the poorer sections of the city—shows that, while there is no great discrepancy, Norwood prices were almost uniformly higher. Cincinnati is one of the few cities in this country which has provided extensively public markets. This fact doubtless led Norwood to build an excellent public market building. Stalls are rented at nominal fees, but for reasons not very obvious, the anticipated lessening of food costs has not materialized.

An effort to work out a co-operative living scheme for working girls was recently started by the Schmidlapp Bureau for Women and Girls. The bureau was founded by Mr. Schmidlapp as a memorial to his daughter, and he has given it an endowment of \$500,000.

Its work is educational, employment-finding and vocational. It provides financial aid for young women to complete their education; it finds work, and studies the industrial experiences of each girl and the problems of her social environment; and through pioneer research work it is seeking to provide scientific data concerning vocational guidance. The director of the bureau is M.

Edith Campbell, formerly in the Economics Department of the University of Cincinnati, and under her expert guidance the bureau is taking an important place in the general movements toward social advance in Cincinnati. She has recently been elected a member of the Cincinnati School Board.

The Schmidlapp Bureau shares with the Union Savings Bank and Trust Company the management of the

Schmidlapp houses already described. It is in one of these house groups that two apartments have been thrown into one, and a group of working girls has been gathered together in a co-operative household supervised by a trained domestic science teacher. With the exception of a weekly house-cleaning the household work is shared by the girls. Each member pays \$1 per week rent and \$3 for board. Some difficulty was experienced at the start in getting a group of unattached girls together in Norwood to try the experiment. This was due, no doubt, to the policy of the United States Playing Card Company in employing girls living at home. The stolid reason for this policy is that it helps safeguard the force from demoralizing influences and there would obviously be no need for co-operative households if all girls were so placed. But for the self-respecting girl living alone, and solely dependent upon her own efforts the policy only serves to increase the difficulties of finding work, and there can be no doubt that it is an important money saver for the company, so far as the pay roll is concerned. The willingness of girls living with their families to accept lower wages than they otherwise would operate most cruelly in fixing a lower wage standard for all working girls.

The furnishings of the home were given by Mr. Schmidlapp, whose interest in the experiment is threefold: To provide a comfortable

SCHMIDLAPP HOUSES—REAR VIEW

place for the self-supporting girl working in Norwood where there is now practically no inexpensive boarding place; to attempt to furnish under trained supervision simple but nourishing food for \$2.75 per person per week, and to teach the careful and economical management of a home.

### *The Lighter Side of Life*

Standards of living are not wholly matters of rent and meals.

A Norwood plant manager, who complained a little because it was so hard to get employes to come out to his establishment, was asked a few minutes later how he liked the advantages of the suburban location for his work. "They are all right," he said, "but I find it hard to keep up the old interests and associations which mean a lot to me. I don't have the same chance to run across old friends and join in the things at the club."

Desire to live where "things are doing," near the bright lights, street crowds, big stores and amusements of the city center, and where friends are close at hand, is, after all is said, an important reason why many Norwood and Oakley workers do not make more of an effort to live where they work. The flats and apartment houses near the downtown section of almost any large city testify to the same sort of craving on the part of better-to-do people who find metropolitan advantages more to their liking than the quiet routine and distance from friends which the suburb enjoins. Theatres, opera, the life of the large hotels and the pleasures of the "smart set" have quite as strong a grip upon them as the cheaper amusements and "thrills" have upon the working people. Most of us have a yearning for sociability.

It is easy to say that working people cannot be tempted to live in the better conditions of the suburbs, that they find it too stupid and quiet.

COMMUTERS' HOMES AT NORWOOD

But there is little housing within the means of the factory workers.

But this is just where our civic intelligence is challenged and where our planning falls short. If it is worth while as a civic policy to encourage escape from congestion to better and healthier living conditions, it is worth while to study out and provide means whereby recreation and neighborhood can be stimulated centrifugally.

No such attention seems to have been given to recreation in Norwood and Oakley. There is a small playground, but it has poor leadership. A few band concerts are held each summer in front of the town hall, and baseball games are played between teams representing the different factories. A night school, with from 350 to 400 attendants provides cooking, sewing and gymnasium work in addition to the common school subjects. This fall the board of education, in response to a petition from some of the factory workers has opened evening gymnasium classes in a school near the factories.

But in general, the public recreation of the community is left to commercial enterprise. It consists of two motion picture shows, one air dome, a baseball park for the games of a Saturday afternoon league, and a few bowling alleys and pool rooms mostly connected with saloons. Lack of any good sized hall for entertainments, lectures, mass meetings and social gatherings has led, however, to an agitation to meet this need in a new city hall for which an issuance of bonds is now contemplated.

PUBLIC MARKET BUILDING AT NORWOOD

School authorities are aware of the value of utilizing schools for evening social and civic centers, but they point out that there are very few organizations to make use of them. Even the neighborhood "welfare societies" which took a great interest in the early civic problems of the community have nearly all died out or become inactive as municipal service has become more adequate. The possibilities of stimulating civic and social organization through promoting social and recreation centers seem unknown. One neighborhood recreation center such as Chicago now has to the number of nearly twenty might, with intelligent leadership, solve the problem. How small a proportion of the community's energy and money goes into public recreation is shown in the last municipal report where a grand total of \$140 is entered for public parks, covering only the playground above mentioned and inadequate for that, and \$40,674 stands opposite police and fire departments.

### *Public Spirit and the Suburb*

While Norwood has not adapted its community life to serve the needs of an industrial population, so far as town planning, housing and recreation are concerned, some branches of public service are well provided. Her school system is considered unusually good. Her health is her proudest boast, though the 1912 budget of \$2,040 for this purpose betokens no especial effort to conserve it and prevent dangers which would undoubtedly creep in with congestion. Water supply is of good quality, but said to be inadequate, particularly for industrial use. The rates are 7½ cents per hundred cubic feet, with 75 cents as a minimum quarterly charge. The water works are municipally owned as is also the electric light plant which supplies light at 6 cents per thousand watts as compared with the Cincinnati rate of 8 cents. Street-car and telephone franchises have involved no serious struggles, but Norwood has had to accept practically the same terms as Cincinnati. In 1900 when a new street car franchise was negotiated, the duration was made uniform with Cincinnati franchises, but two extensions of lines and a five-cent fare to any point in Cincinnati by universal transfers were secured.

It has been in the handling of the gas situation that this town has really shown its stride. Norwood secured striking advantage not only for her own citizens, but for all Cincinnati. The rate in Cincinnati had been 75 cents a thousand feet, and this was the rate which the Cincinnati company also charged the suburb. The Norwood city council encouraged an Ohio company to pipe in natural gas at 25 cents per thousand feet. To meet the competition the Cincinnati company found itself compelled to pipe in natural gas from West Virginia. The Ohio company

then sold out its rights to the Cincinnati company, but not before the citizens saw to it that the price should remain as low as 30 cents. Cincinnati was thus, through Norwood's civic alertness, enabled to secure its supply at less than half the rate it formerly paid.

Annexation to Cincinnati has thus far been successfully opposed by Norwood which recently voted against it by 2,759 to 930, while Cincinnati voted 5 to 1 for it. Oakley voted for annexation, but an injunction has blocked it thus far.

Norwood's chief argument in opposition, the fear of putting good neighborhood conditions at the mercy of a gang-ridden city, has been greatly lessened by Cincinnati's recent election of Mayor Hunt, an able young reformer who is giving the city an efficient administration. "When Cincinnati gives evidence that her reform is permanent, and when she goes in for such things as parks and schools for her whole population, we'll be glad to come in," said a fair-minded Norwood citizen who has consistently opposed annexation. Norwood's contention that under annexation there would be no assurance as to how much of her taxes would be spent locally is answered by Mayor Hunt's statement that the expense of serving territory annexed in 1911 would be \$272,329, or more than three times the revenue, \$86,284, to be gained from such territory.

### *The Metropolitan District*

The broad handling of the town planning, housing and transportation conditions in these industrial suburbs, involving the relation of industries to residential areas demands first of all a program of construction and public control in the interests of the whole body of people who live and work in them. Each community needs civic coherence. What can be done by concerted action has been shown in the "factory colony," in the Schmidlapp housing enterprise, and in the fight for gas. The need, however, is wider than this. The complexities of modern life which have made citizens so interdependent upon each other for their mutual welfare have also made the towns and flanges of a metropolitan district interdependent. Each locality has much to gain from a comprehensive plan involving all, and each has something to contribute, just as Norwood's efforts gave to the whole people of Cincinnati the boon of cheap lighting.

The exodus of industry from the congested center of Cincinnati has shown us no comprehensive and intelligent civic policy on the part of the big city to promote and guide community development. Equally in their smaller spheres, Norwood and Oakley have failed.

If the same degree of forethought, skill, intelligence and enterprise, which was applied to

the planning of the "factory colony," had also been applied to the scheming of the community life of Oakley and Norwood, the environs of Cincinnati might now have developed the most interesting and significant industrial suburbs in America, might even have shown us our nearest approach to the garden suburbs of England in point of co-operating land ownership and building as well as in physical arrangement. With broad fields, trees, gentle hillsides, and a ravine with a water course, nature has done her part to provide beauty. But, except in the efforts of Mr. Schmidlapp, not the slightest attempt has been made to solve the problem of the workers' household in these surroundings near his work. The recreation of the working girl seems to

have received scarcely a thought. The removal of the factory to the rim of the big city is not an adequate solution of our civic-industrial problem if it leaves the worker's home in congestion<sup>1</sup> or even if it transplants it to a region where the whole fabric of community life is left to remain undeveloped.

The same foresight and intelligence which is so skillfully applied to the planning of industrial expansion should be utilized in the great concentric opportunity to shape civic and social conditions in the outer belts of growth.

<sup>1</sup>The following was displayed at the recent Cincinnati municipal exhibit. "According to last figures available, 1900, in Toledo, 4 per cent of all families were living in houses of three or more families; in Indianapolis 6 per cent; in Detroit 7 per cent; in Columbus 8 per cent; in Cleveland 13 per cent; in Louisville 17 per cent; in Buffalo 24 per cent and in Cincinnati 44 per cent.

## THE SALEM TRIAL

JAMES P. HEATON

"JOSEPH J. Ettor, look upon the foreman. Mr. Foreman, look upon the prisoner."

The two men gazed at each other—the buoyant Italian and the shrewd Yankee.

"What say you, Mr. Foreman, upon your oath—is the prisoner guilty as charged?"

"Not guilty."

Such was their verdict—four carpenters, a hair dresser, a sail maker, a leather dealer, a stock fitter, a morocco dresser, a grocer, a driver, a lamp worker—the men at whose hands the three chief labor cases<sup>2</sup> growing out of the Lawrence strike were brought to a conclusion November 26; cases which, more dramatically than any since the Haymarket riots sent four men to the hangman, hinged on the question of how far labor leaders can be held responsible for acts of violence committed in the midst of a strike.

After ten months in jail and fifty-eight days of trial, Ettor, Giovannitti and Caruso left the court house free men<sup>3</sup>. There were the joyous hugs and kisses of their fellow-countrymen, but the feeling of comity and good will, after the long months of controversy in the mill districts, was not limited to these. As the trial had drawn along, public opinion in Salem, despite the somewhat antagonistic attitude of the chief newspaper and occasional disquieting rumors of a plot for a jail delivery, had grown more and

more favorable toward the defendants. One phase of it was reflected by Juror No. 6. "If a thousand Americans had been treated the way those fellows were treated, there wouldn't have been a mill left standing in Lawrence," he declared in recounting his sayings in the jury room. The friendly attitude, however, did not always mean a conviction that the accused men were innocent of all offense. It did represent a strong belief that the state had overshot the mark in getting full capital indictments against Ettor and Giovannitti, who were not present at the time of the shooting. The belief of the mill operatives in Lawrence that they were being held in prison "on a trumped-up charge of murder," originally brought as a piece of anti-strike tactics, has been shared by attorneys, newspapermen, ministers and students of public affairs, who have followed the proceedings.

"The best thing of all," to quote the dean of the newspaper correspondents, as he was congratulating Ettor and Giovannitti, "is that everybody seems happy. I enjoy a court trial assignment which ends like this. I have just been the rounds to say goodbye, and found everybody, including the judge, sheriff, court officers, and all the attorneys, in the best of good humor."

So it was that everywhere people sprang up to shake the hands of the three prisoners as they left the court, and on the sidewalk outside a battery of photographers, jostled by impatient and elated textile workers, waited for their game. The acquitted men started over to their lawyer's office, but the crowd fairly blocked the little one-track street of Old Salem into which they turned, until a friendly Salvation Army captain bade them come to his hall. Here an impromptu meeting followed, and soon out from its windows flanked

<sup>1</sup>See Legal Aftermath of the Lawrence Strike, by James P. Heaton, THE SURVEY, July 6, 1912.

<sup>2</sup>To the surprise of nearly everybody Caruso, though under a separate indictment for an assault to kill, was released on his own recognizance. As soon as he had given his oath to stand trial when summoned, he worked his way to the side of his wife, whose face lit up with a smile of content. Ettor and Giovannitti charged, along with Haywood and Glannini, with a conspiracy to intimidate Lawrence workers, were bailed by Helena S. Dudley, of Denison House, Boston, and Mary Kenny O'Sullivan, one of the old line labor leaders and an organizer of the Women's Trade Union League of America.

by gospel mottoes gushed the rousing strains of the Marseillais.

The whole Lawrence struggle has been full of contrasts. There were the contrasts brought out by the strike itself. Here was a typical New England manufacturing city, with its "Dublin" of Irish, its French "Canucks" and Nova Scotian "Blue Noses" from across the Canadian line, suddenly overwhelmed by an influx of Latin and Slavic peoples; its hum-drum civil government bewildered, taxed to the breaking point by a tug-of-war between new and disruptive industrial forces. Here were the great textile interests, which had baffled tariff reformers and old-line craft unions, suddenly bearded by their unskilled day laborers.

In the trial at the sleepy county seat came more contrasts. There are three court houses in Salem, side by side, erected at different times in the past seventy-five years. And back of them range a dim succession of court rooms reaching in imagination to the trials of the Salem witches. It is in this town that the preachers of the new industrialism, of syndicalism, and the latest revolutionary doctrines of the world's labor movement, were before the bar for bedeviling workmen in the minds of the grand jury. It was to the individualistic traditions of Puritan New England, to the principles of the revolutionary fathers which he believed are today threatened by foreign malcontents, that the district attorney made his plea when summing up the case. It was to the tidings of a world-wide working class rebellion in the name of industrial brotherhood that the prisoners made theirs.

But the contrast which reached furthest and deepest, perhaps, in its practical social significance lay in the new conception the trial has afforded the new wage-earners in the textile towns of what democracy stands for in America. The strikers at Lawrence had felt the force of government in the swinging clubs of police and in the prodding bayonets of the militia. They had chafed when that force barred parents from sending their children out of town, and had voiced their wrath when it was embodied in the unnecessary midnight arrests of young working girls. They had seen the government of the native-born in one day sentence a score of foreign rioters to serve a year's sentence in the House of Correction, and they had seen it falter in the case of Breen (school committeeman and son of a former mayor), who was convicted of planting dynamite to discredit the strikers,—falter and let the man off with a fine.

Now they had a new, potent embodiment of the old Bay State, not in the prosecution, but in the even tempered New England judge of the old school, and in the twelve "good men and true" who sat, listened and coolly made up their verdict.

There have been those who have felt that the

fabric of the commonwealth of Massachusetts has been imperilled not only by new doctrines of social revolution, but also by the almost instantaneous recoil of the authorities against what they have deemed crime and sedition. It was recognized by all participating that the conduct of these cases could either win the respect of the mill workers of New England or plant and spread distrust. That the Superior Court of Essex County measured up to its responsibility for the maintenance of the reputation of Massachusetts tribunals for probity and judicial acumen was attested by Ettor himself in a statement at the conclusion of the trial. A former district attorney of the county, who is also a former judge, discussing the case in his office just after the trial was over, rejoiced because he felt the outcome answered completely those who feared lest public opinion in Essex County was so prejudiced against Ettor and Giovannitti as to make it difficult to secure for them a strictly fair hearing.

While there will be some in both camps who will claim that the three men got off because of the fear of what might have happened had they been sentenced to death, there has been borne in upon a great middle group, and with them upon thousands of alien workers, an abiding sense that American justice can weather times of industrial stress.

The trial opened on September 30 after a postponement which was requested last May by the defense. There has been misunderstanding about this delay. For this the defense committee of the strikers' is largely to blame, as in their appeals for funds they held up Ettor and Giovannitti as martyrs kept in jail through the dictation of the money powers. One appeal, issued while the trial was on, made necessary an awkward explanation to the court by the attorneys for the defense.

The trial itself went over much the same ground that was covered in the inquest before

While the fund raised by unionists and Socialists throughout the country for the defense of Ettor, Giovannitti and Caruso did not approach in size that collected by the American Federation of Labor for the McNamara brothers, it did permit the engagement of five attorneys, whereas the state was represented by but two, District Attorney Atwill and his assistant.

The floor leader of the corps of lawyers for the prisoners was W. Scott Peters, a former district attorney, dubbed familiarly by his successor and pupil as "the old fox of Essex County." Caruso was represented by Joseph H. Sisk, an attorney who has figured in many Massachusetts murder cases. For his personal attorney Ettor had John P. S. Mahoney of Lawrence, who was the first lawyer of standing to be associated with the operatives and early in the strike became their counsel. The two other men in the legal force of the defense were George E. Roewer, Jr., a Socialist of Boston, and Fred H. Moore, a member of the Industrial Workers of the World, from Los Angeles.

The attorneys were aided in the selection of the jury by Robert Reid, a former Salemite who investigated the records of all the eligible jurors as he had done in several other big cases in New England. Practically a week, not counting a long intermission for enrolling a second panel of 360 jurors, was required for the selection of the twelve men who were to decide the fate of the three prisoners. The large representation of workmen on the jury reflects the successful jockeying of the defense. Though the judge refused to allow the lawyers for the prisoners to examine the jurors about their financial investments in Lawrence woolen mills, the jury was satisfactory to the prisoners.

Police Magistrate Mahoney in Lawrence, February 9. In a clash between the police and a crowd of strikers on the evening of January 29, Anna Lopizzo was killed. Ettor and Giovannitti who, as Industrial Workers of the World leaders had come from New York to throw themselves into the strike and weld it into their movement for revolutionary industrial unionism, were charged with inflaming the actual murderer by a propaganda of violence.

The commonwealth obviously faced the task of proving two things. One was that strikers, or their sympathizers, fired the shot. The other was that a convincing connection existed between their acts and those of the strike leaders, a point involving far-reaching issues of strike leadership and responsibility.

The evidence on both points proved insufficient. The man who fired the shot was not surely identified. He was described by the state as Salvatore Scuito or a "person unknown." Scuito was never apprehended and it was not for weeks that Joseph Caruso, an Italian workman who before the strike had been working in the Lawrence mills for a few dollars a week, was arrested as a principal. Witnesses for the state testified that a shot aimed at Policeman Benoit had missed its mark and killed a fellow striker. The defense produced witnesses who swore that Policeman Benoit himself fired several shots toward Mrs. Lopizzo. The police denied this. To refute the imputation of the defense, the state showed that the bullet which killed the woman was of different caliber than the official police arm of the Lawrence force. The trial did not bring out strong evidence definitely connecting Caruso, charged as a principal, with the actual marksman. The most damaging testimony against him was that he stabbed Policeman Benoit, and an indictment for assault with intent to kill is pending against him. He claims an alibi; and it is to be noted that up to the time of his arrest he had made no effort to leave Massachusetts.

As evidence and proof of a propaganda of violence, the state introduced testimony concerning speeches made by Ettor and Giovannitti. The natural and intended consequence of these, the district attorney argued, was an organized attack upon the street cars to intimidate those going to work and the disturbance on the evening of January 29 when Anna Lopizzo lost her life.

Only one markedly inflammatory statement to the strikers was attributed to Giovannitti. Two detectives in the service of the Callahan agency declared that in a speech in Italian he told his listeners to sleep in the daytime and prowl around at night like wild animals. The witnesses admitted that they had destroyed their notes of the speech. One of the few other points which were seriously urged against him was his signature on a justly censured circular for which he and Ettor disclaimed responsibility.

Partly at least because Ettor's speeches were delivered in English, the brunt of the evidence was directed at him. The doctrines of direct action held by leading exponents of the Industrial Workers of the World were read into the record, and Ettor's position in the Anarchist wing of the industrial unionists was made clear. Stress was placed upon statements quoted from him that Lawrence would be an unhappy city and that the strikers would keep the gun shops busy. By the first of these, according to the defense, Ettor referred to an impending strike of the power-house employes which would have left Lawrence in darkness and without street-car service. He contended that the second statement was his way of protesting against the issuance of revolver permits to special policemen and mill representatives. If the strikers asked for the same privilege, he argued, their wholesale applications would show how dangerous it was to allow private individuals on either side to carry deadly weapons in a time of industrial conflict. The plain advocacies of violence to be found in St. John's history of the Industrial Workers of the World were declared by Ettor to be personal views of the author, with which he did not agree and along which the Lawrence committee had not acted. The defense produced ministers, whose veracity the prosecution admitted, who testified to the innocent intent of Ettor's speeches. And finally the judge's charge removed the possibility of death for Ettor and Giovannitti because it limited the jury to a verdict of murder in the second degree.<sup>1</sup>

The great strength of the defense, proved to be the testimony of these two men themselves. Exact in details, Ettor gave a wonderful exhibition of memory. Day by day he recalled not only the events that had taken place, but recited the words of his speeches.

"Do you remember," Mr. Attwill would say, "that in the police court I asked you so and so, and you replied so and so?"

"I do not," Ettor would counter. "I did say in substance what you have just read, but it was in answer to another and a subsequent question, not the one with which you seek to connect it."

In a long and weary cross examination Ettor was master.

When the trial was all but over, the two Italian labor leaders, moved by what proved to be a true inspiration, disregarded the advice of their coun-

<sup>1</sup>From a legal standpoint, the prosecution, despite able personal work by the district attorney, did not make out a strong, compelling case. A number of close observers believe that the defense could have safely rested when the prosecution did and omitted all evidence in rebuttal. Some of the state's best witnesses were shown to have been convicted of various offenses so that their testimony was discounted.

The defense, however, partly offset this advantage by clumsy handling of their case. Perhaps this was due to lack of perfect team work between the five attorneys representing the prisoners. Some of their witnesses played into the hands of the state. One of the attorneys for the labor leaders, largely through overwork and worry, failed to take full advantage of his opportunities.

sel and made the most dramatic plea for freedom or for death that has been heard in Massachusetts within the memory of lawyers and veteran newspapermen. In an impassioned speech of mingled defiance, persuasion and appeal, Ettor protested against being tried for his social ideals. He put it:

"If you believe that we should not go out with our views, I only ask that you will place the responsibility full on us, and say to the world that Joseph J. Ettor and Arthur Giovannitti, because of their social ideals, became murderers and murdered one of their own sister strikers, and you will by your verdict say plainly that we should die for it. . . . I neither offer apology nor excuse; I ask no favors; I ask for nothing but justice in this matter."

But after all, Ettor's speech was not the one which carried away the hearers and left a spell over the court room till the trial was finished. Speaking publicly for the first time in English, Arturo Giovannitti, slender, pale, trembling, courteous always rather than assertive, showed himself truly the poet who lives, as well as writes with ink on paper.<sup>1</sup> His final sentences choked

<sup>1</sup>Excerpts from the verse Giovannitti wrote in prison were published in *THE SURVEY* for November 2.

up some of the reporters, busy as they were trying to take them down:

"And if it be that these hearts of ours must be stilled on the same death chair and by the same current of fire that has destroyed the life of the wife murderer and the patricide and parricide, then I say that tomorrow we shall pass into a greater judgment, that tomorrow we shall go from your presence into a presence where history shall give its last word to us."

"In twenty years of reporting I have never heard the equal of that speech," said a veteran reporter, at the end of the trial. And, as a final bit of contrast, the old court crier, stocky of build as Joe Ettor himself, but clear-skinned, sharp-nosed and with the look of the fifer in the familiar prints of "The Spirit of '76," opened toothless gums and droned the formula which has closed the sittings of the Massachusetts courts of even handed justice since the founding of the state:

"Hear ye; hear ye; all persons having anything to do before the honorable, the justices of the Superior Court now sitting in Salem, draw near and give your attention. Know all ye that the September term of the Superior Court is now adjourned without day. God save the commonwealth of Massachusetts."

## BOYS AND LOCK-UPS

LOUISE DE KOVEN BOWEN

PRESIDENT JUVENILE PROTECTIVE ASSOCIATION

**T**HE Juvenile Court Law of the state of Illinois extends to all boys under seventeen and all girls under eighteen years of age. It should be amended so that any person under twenty-one years may be brought into this court, rather than into the police court. At present, if a boy just over seventeen commits a crime, he is tried in the criminal court and thus identified with the worst criminals in the community.

Some time ago the attention of the Juvenile Protective Association was called to the large number of "juvenile adults"—that is, boys and girls between the ages of seventeen and twenty-one years of age—who were confined in the county jail. The association made an investigation and found that in the year 1911, 1,328 boys and 61 girls under twenty-one years of age were confined there.

It decided to study the cases of one hundred of these boys. This inquiry took the investigator into the police stations where the boys and girls are first taken when arrested. Some of these police stations are indescribably bad; the cells are in the basements which are dingy, damp and unsanitary and generally unfit for human habitation; the surface of the brick walls is rough and unclean; very few of the cells

have any sanitary conveniences; most of them have either buckets which are unspeakably vile, or troughs which are supposedly flushed with water. As a rule, the sewage is entirely neglected.

Many of these cells are not only filthy but they are breeding places for contagious diseases. In one station there are eight cells in a row, five for men and three for women; there is a trough running through these cells which, according to the attendant, "works very badly." This lack of proper provision for prisoners is not only a public nuisance, according to the Chicago code, and a crime against those incarcerated in the cells, but a menace to the community at large.

According to the Police Department report for 1911, 81,648 persons were locked up in the police stations that year. The greater number of them were kept in the cells over Saturday and Sunday nights, these nights being in the words of the police "the busiest evenings of the week." Of this number 9,840 were women and 1,380 young girls. Under the above conditions one can realize the utter degradation of a "lock-up" over night in one of these stations. To appreciate fully the danger these cells are to the community, it must be remembered that a large number of innocent people are confined

there. Out of the 81,648 people arrested last year, 49,934 were discharged by the municipal court when their cases came up for trial; these people were presumably innocent. Of the women alone, 1,920 were arrested only to be held as witnesses. Would such inefficiency be tolerated in other enterprises, public or private? Undoubtedly if the police were not promoted according to the number of arrests made, so large a number of innocent people would not be subjected to this unpleasant experience.

Again, the police officers frequently make arrests without warrants. This, of course, is "permissible by anyone for a criminal offense committed or attempted in his presence, or when he has reasonable ground for believing that the person being arrested has committed a crime," but it is unusual and dangerous, as a case like the following will show.

Two young girls recently came to Chicago from a neighboring town, hoping to find work. They lived with their sister, a working girl, in two cheap but extremely clean rooms in a respectable lodging house. They were unable to find work and were entirely dependent upon the meager income of the younger sister. One night they met, through a friend, a young man who invited them to dinner. The hungry girls accepted with pleasure, but when, at the close of the evening, the young man wished to return with them to their room, the girls protested and forcibly locked the door against him. The man threatened to have them arrested before morning and kept his promise, for at four o'clock a police officer appeared at the door without a warrant, and took the girls to the police station where they were lodged in a cell for the remainder of the night. They were given bread and water for breakfast and were told that if they wanted coffee or anything else they must pay for it. The effect of this experience upon two young and innocent girls can well be imagined.

The cells are often so crowded with inmates that it is impossible for them to sit down. The writer has seen them in this condition. There are ordinances requiring that lodging-houses provide 400 cubic feet of air for each inmate, but there are no laws or ordinances requiring that similar provision be made for prisoners in the police stations. The drinking cups and dishes are never sterilized; they are used indiscriminately by all the inmates, many of whom are afflicted with venereal diseases. The Board of Health has the right to quarantine a place where contagious illness is found, but many of these police stations which are simply breeding places for disease are left untouched! Our Illinois law forbids the use of the common drinking cup in public places; should it not go farther and provide for the sterilization of eating utensils in jails and police stations where not

only the innocent, but also the morally defective, should at least be protected from physical ills?

Another wrong committed in these stations is the failure to make a proper classification of prisoners. At present, comparatively decent men are put in with the indecent. Innocent girls and prostitutes are often cellmates!

Out of the hundred cases investigated, ten boys complained of police abuse; six said that their arrest had not been reported to their parents, one mother only learning of the arrest of her child through the newspapers. There are many serious charges against the police officers; one boy was beaten with a billy and sand bag, knocked down three times and kicked—all in an endeavor to make him confess to something he had not done. Another was taken by the throat, hit on the mouth and a tooth knocked out. Another was taken into a small room and beaten with a billy, this in an effort to get information against other boys. Another had cold water poured over him with the threat that if he did not confess he would be treated in the same way with hot water. Such methods are sure to arouse hatred and opposition and will certainly never increase the boys' respect for the law.

Another injustice in the police stations is the "mugging" system. When a boy or a man is arrested and held to the grand jury by the municipal court, his photograph and measurements are taken, an impression of his thumb is made and these are placed in the rogues' gallery. The captain of the identification bureau stated that in 1911, 5,338 cases were brought to this bureau for photographs and description. Out of this number 2,383 were found guilty and sentenced to some penal institution; the other 2,955 were discharged, presumably innocent, but their pictures and descriptions remained in the rogues' gallery. It also appeared that the poorer prisoners who were unable to secure bail were "mugged" while awaiting trial by the criminal court, and those able to find someone to go on their bond were not subjected to this disgrace. Are we so proud of our criminal records that we must add to their number by putting a stigma on innocent people from which they can never escape?

The investigation also showed that first offenders in the jail were often treated by the court with the same severity as those brought in for the third and fourth time. There seems to be great inequality in the treatment of prisoners charged with the same offence, some first offenders being sent to prison and others, brought in for the third and fourth time, being placed on probation.

For example, out of ten accused persons brought in for the first time on a serious charge, only one was put on probation; the others were held over to the grand jury or convicted. Of five who were brought in for the second time, two were put on probation, and out of three

brought in for the third time, one was put on probation. In other cases boys would be held awaiting the action of the grand jury for weeks, or even months, and then the grand jury would find that there was no evidence against them. Out of eight cases held to the grand jury by one judge, three were dismissed because no bill was returned, two were found not guilty and one was discharged by the criminal court.

I recall one especially pathetic case where a boy had been arrested charged with a certain crime. He declared his innocence and was held without bail. Our association became interested in him and he was allowed to leave the jail, giving his own bond for his reappearance. The charge preyed on the boy's mind; he could not sleep or eat and became pale and thin, the shadow of a possible conviction darkening his life. The day that the grand jury returned no bill finding the evidence insufficient to hold him to the criminal court he was found dead in his room with the gas turned on; he had ended his life because he could not bear the suspense and thought of a possible prison sentence.

The association also found that there was great exploitation of boys in the county jail by attorneys who sought them out promising to "get them off." In many cases the attorney made no effort to defend the boy. In others, he took money from the parents and never appeared when the case was called for trial. In this connection, does it not seem as if it would be advisable to have a public defender for the poor people who are arrested and brought into the county jail? We have a public prosecutor, why not a public defender?

The investigation emphasizes the fact that only three out of the hundred boys had a trade. Only six had been allowed to work at the occupation which they really desired. Most of them had been put to work at anything obtainable. Sixty-six had begun to earn their living at fourteen years of age or younger. According to the government reports, the wages of unskilled laborers who leave school before they are fourteen increase slowly from \$3 to \$10 per week until they are twenty years of age. Here they remain stationary until they are forty years of age when their earning capacity again begins to decline.

Out of the 1,328 boys in the jail, 721 had been engaged in unskilled occupations. Nineteen boys had wished to become machinists; out of this number, four drove wagons, one was a farmer, three were messenger boys, one an office boy, four were laborers, three were errand boys in stores, one was a chauffeur and two were grocery clerks.

This study of one hundred cases shows the need of some plan which would make it easier for prisoners to be released on bond between the preliminary hearing by the municipal judge and indictment by the grand jury. The amount of

bond is often very high; in one case \$3,000 was required as bond for a \$40 larceny. The parents of these boys are often unable to secure bondsmen and their grief at being parted from their children, and their feeling of disgrace at leaving them in jail, can well be imagined.

Many of the boys in the jail were found guilty of serious offences, but a large number—599 out of 1,328—had been arrested for their first offence. One of the boys arrested had started to go fishing and had stolen a ride on a freight train. Finding that the train did not stop at the little lake where he intended to fish, he pulled the air brake and got off. He was promptly arrested and charged with an "attempt at train wrecking." Conviction was followed by sentence to prison. The Juvenile Protective Association produced new evidence and the state's attorney changed the charge. A motion was made to vacate the order of the court and the boy was put on probation. He has made good in the position found for him, and the state has secured a good citizen and has been saved the burden and expense of a criminal.

Unfortunately, the law does not take into consideration whether the prisoner is young or old, a first offender or a hardened criminal. It does not provide any means by which the judge can learn his previous history, his heredity or environment. It is exactly the same, someone has said, as if a physician administered the same medicine to every patient when his temperature rose to a certain height, without making any inquiry as to symptoms, previous history or what led to the present illness. Many first offenders are not criminals by choice or at heart; they have yielded to some sudden and overwhelming temptation. If given another chance, if put under wise probational guidance and their environment readjusted, they would become good citizens.

On the contrary, with a prison sentence, the criminal comes forth hardened and disgraced, his hand against every man's and feeling that he has paid his full debt to society. It is said that nine-tenths of the serious crimes in England are committed by men who have served one or more terms of imprisonment. It therefore seems as if our present system should take more into account the human and individual side of the problem, prescribing such preventive and other measures as would seem best for the good of the person and the welfare of society. Such reflections are the result of the study of boys in the jail and police stations of Chicago, presumably typical of the thousands of boys found under similar conditions in every large city of America.

## THE CHRISTMAS SEALS

PHILIP P. JACOBS

PLAYING "post office," not exactly in the osculatory manner in which it is done in the common parlor game, but in a way somewhat similar, was a game by which some of our mothers and grandmothers, and even some who read this page, helped to make a million dollars during the Civil War.

It was in 1862, when the northern hospitals were being taxed to their utmost to care for the thou-

sands of sick and wounded soldiers returning from the war that

some women in Boston and Brooklyn almost simultaneously hit upon the idea of having fairs, the features of which should be post offices where anyone could get a letter from anybody he wished to hear from, provided he

would pay the postage. Postage was in the form of "sanitary fair stamps" of varying denominations. The price was fixed by the generosity of the buyer.

These stamps were the forerunners of our popular Red Cross Seal and were the first of the thousands of charity stamps which now are sold all over the world. The Brooklyn fair is memorable for the \$400,000 realized, largely through the stamps sold. In Boston, Springfield, Albany, Stamford, and scores of other places sim-

6

ilar fairs were held with like success, so that over a million dollars was collected between 1862 and 1865.

After the Civil War the stamp idea was forgotten until in 1892 when the Red Cross of Portugal revived it in its campaign for relief funds. Again the popularity of the appeal was demonstrated, and since that time, the "charity stamp" has found vogue in almost every part of the world from Iceland to Australia and from Russia to California.

The variety of purposes for which these stamps and seals are sold is almost as great as the number of places selling them. For example, soldiers' stamps are sold in Italy, Hungary, Roumania and elsewhere. In Austria there are over thirty different kinds of stamps for children's hospitals. Germany has 300 or more kinds of

*Wohlfahrtsmarken* sold in almost as many different ways. In England missionary organizations and churches sell stamps for their special funds. Stamps for memorial funds and stamps commemorating some special event such as the coronation of King George V., the proceeds of which are used for charitable purposes, are common also. In Roumania, Denmark, Russia and other European countries, special

7

9

10

11

12

13

8

14

stamps of this character are good for postage, the additional charge for the charitable fund being added to the ordinary postage cost.

Practically all these European stamps, however, are sold throughout the year, and except in a few instances, sales campaigns at certain seasons

of the year are not undertaken. Notable exceptions are in Norway, Sweden and Denmark, where special stamps for tuberculosis funds have been issued since 1904, and where active campaigns during the holiday seasons are usually carried on. The movement is waning, seemingly, in these countries each year, largely because other national movements are taking their place.

The United States has led the world in demonstrating the possibilities of an organized movement for the sale of seals or stamps. When, in 1907 Emily P. Bissell of Wilmington, Del., seized upon Jacob Riis's suggestion in the *Outlook* that someone in this country pattern after Norwegian and Swedish tuberculosis stamps, little did she think of the possibilities that she had opened up. From a sale of \$3,000 in 1907, limited to a very small area in and around Philadelphia and Wilmington, the Red Cross Seal sale last year reached a total of over \$330,000 and spread into almost every part of the United States, including our insular possessions and the Canal Zone. Nearly \$1,000,000 has been realized since 1908, when the American Red Cross issued, at Miss Bissell's persuasion, the first seal for the benefit of the national anti-tuberculosis move-

ment. And, if the present organization is any indication of success, the sale this year should exceed by several thousands of dollars that of last year.

A few of the factors that have contributed to the success of the Red Cross Seal campaign should be noted. First, there is the careful and energetic organization, beginning with the national agent and running down through state agents, and local agents to the army of nearly 50,000 sub-agents. Next, the vital publicity work on tuberculosis with which the six weeks before Christmas is turned into an educational campaign; and third, the distribution of the proceeds. By far the largest percentage, from 75 to 90 per cent. of the receipts, remain in the local communities where the seals are sold. Hundreds of local forms of anti-tuberculosis work have been financed in this way. Indeed, it is not too much to say that in some of the states leading in this campaign the anti-tuberculosis movement would be poorly organized today if it were not for these Red Cross Seals.

A  
CHRISTMAS  
MYSTERY  
PLAY AT  
DENISON  
HOUSE

LAURA E.  
LOCKWOOD  
WELLESLEY COLLEGE

CHRISTMAS week at Denison House in Boston, the college settlement on Tyler Street, is full to the last moment. I asked the privilege of residence during this week, but I admit with the idea of remaining merely an on-looker. I found myself, however, before the end of the first day swept into the current of life, filled with the spirit of service and busy every moment with hands and head. I saw in a new light the problem of helping the peoples of various nationalities to become like us in sympathy and citizenship.

The men and women who interested me most were of the Syrian group. Their dark, eager faces and bright black eyes, their enthusiasm and earnestness made work with them an exciting pleasure. In 1910, they formed, with the aid and co-operation of their friends at Denison House, a neighborhood club called the *Geimaat Surea Americana*. This club, meeting once a month, numbers at present eighty-five members, and is composed of men and women, both young and old. The meetings are devoted to reading, to music, to short speeches, on various civic or educational topics; and they always close with a social hour of conversation and neighborly talk. Occasionally a hall is hired, and the club invites all the Syrians to listen to addresses by prominent men and women of Boston on the educational or industrial opportunities offered by the city. These open meetings are well attended, and the men and women listen with an interest which clearly shows their eagerness to learn the ways of their adopted country.

Perhaps the most ambitious undertaking of the *Geimaat* was the giving, during Christmas week of 1911, of Miss Buckton's play of Eager Heart. That love of the dramatic, which is so fundamental in us all, Denison House recognizes and uses wisely to hold and to entertain the many young people of the neighborhood. So the club

wanted to give a play, and Eager Heart was chosen because it seemed peculiarly to lend itself to an oriental interpretation. The play being chosen, a committee of three was appointed to have full charge of the work. This committee consisted of Rasheed Abdounour, Nasim Khouri, and Gertrude Tebbutt. Rehearsals began November 15, and had to include not only the regular work of interpreting lines, character, and action, but also the correct pronunciation of English. All the parts, except that of Mary, were taken by young men. The task from all points of view seemed exceedingly difficult, but success was made possible by the devotion of the committee and the two coaches,—Mr. Clark for the dramatic action and Mr. Updegraff for the English enunciation; and by the faithfulness of the cast in attending rehearsals and in following with intelligence the instructions given.

The costumes were all loaned by members of the colony, and so much was zealously pressed upon the committee that double the number of actors could well have been provided for. The various articles of furniture for the stage—table, lamp, rugs—were also from the homes of the people. Denison House has no room large enough for dramatic purposes, and, while all the rehearsals took place at the settlement, the play itself could not be given there. Hence a neighboring church with a seating capacity of about four hundred was hired. The young Syrian men, under Mrs. Tebbutt's direction, decorated it with Christmas greens, built a small stage in front of the platform, massed a number of little evergreen trees at the side of the stage to screen the musicians, put up the curtains, and arranged all the furniture.

The play was given three times, on the evenings of December 28, 29 and 30, once as a dress rehearsal and twice as a regular performance. The house was full on each of these three even-

#### THE CASTE OF EAGER HEART

A Christmas mystery play, produced by Syrians at Denison House, Boston.

ings, and many who wanted to see the play could not obtain tickets. The Syrians on the committee guaranteed half the expenses, and no admission fee was charged, as they wished especially that the play should be the contribution of the club toward the entertainment of the Syrian colony. The half for which the American part of the club agreed to provide was contributed by friends of the members. The tickets then being free must be distributed, and one of the most difficult tasks of the committee was the wise distribution of these eagerly desired favors.

The play, as I witnessed it, seemed to me very impressive, because of the simplicity, dignity, and sincerity with which the parts were taken and the lines spoken. These young men wore their dress of course with such ease as could never have been acquired by American youths; they were unaccustomed to the stage, yet they stood without self-consciousness, moved naturally and without awkwardness. The English words, it is true, were not always pronounced with exact correctness, although far more so than I had expected, but they were always easily understood. The play was, however, excellent chiefly because the actors truly understood and felt the spirit of the Christmas story of the Christ, and with unaffected earnestness conveyed that feeling to the audience. I had seen the far more elaborate presentation of this same play by Americans in Copley Hall, but that rendering was by no means so impressive as was this. The Syrian faces, the oriental costumes, the simply spoken lines, the dark, eager faces of

the audience gave unity and intensity to the thought of the expected appearance of the great King and of his simple coming. The music, rendered by a group of Syrian girls under the leadership of Marguerite Fiske, with Elizabeth Lincoln and Bertha Bigelow as first and second violin, admirably introduced, interpreted, and supported the lines of the actors.

The audience, four-fifths Syrian, listened intently to the end of the program, although few of them could have understood all the English words and phrases, and some of them did not understand any at all. Nearly all the men speak English, it is true, but to use a language in everyday affairs, and quickly to grasp the unusual words and groupings of words in a play are two very different things. Before each act Dr. Khouri told in Arabic the story of what was to follow. Yet even so some restlessness would have been excusable, for the play has little striking action and the plot evolves slowly. The quiet attention showed respect for the play and interest in this undertaking of the club. The next morning I asked the keeper of a small shop whether he had seen the play. His face brightened, and he answered at once, "Oh, yes, very good, very good. I go again tonight, if I can get ticket." And this seemed to be the sentiment of all those present.

The hearty co-operation of Syrians and Americans in this colony certainly shows that each nationality appreciates the other, and that each is grateful for what the other brings to the common pleasure and the common education.

## AREQUIPA SANATORIUM

WHERE A TUBERCULOUS PATIENT CAN BE CURED WITHOUT EXPENSE TO HIMSELF OR ANYONE ELSE

\* RICHARD C. CABOT, M. D.

**A** SANATORIUM where patients can earn the cost of their maintenance, where they can sit at ease out of doors all the year round in one of the loveliest spots of beautiful California and make pottery so finished and so exquisite that the demand for it exceeds the supply,—that is what Dr. Philip King Brown has established at Arequipa, an hour by rail from San Francisco, near the little town of Fairfax, in Marin County. It sounds too good to be true, and I could scarcely have believed it if I had not seen it and lived near it for some weeks last summer.

Patients do some work at other sanatoria. They work at Frimley in England, for instance, and at Endawood near Baltimore, but there they work for their health and earn nothing. They work at the Oakes Home in Denver, at Rutland, Mass., and at Trudeau in the Adirondacks, but what they earn in these hospitals does not pay their bills.

What is done at Arequipa is done, so far as I know, nowhere else in the world.

The great curse of tuberculosis to all but

the rich (in whom it is relatively rare) is not the physical suffering it entails, but the serious expense of so long and wearing an illness stretching over months and years and the ravage which long idleness makes in the patient's character. Despondency pulls down some patients as seriously as the disease itself. Restlessness drives others into every sort of vice and folly which sanatoria endeavor in many ways to conceal and control. To conquer these evils through work, and still more through the encouragement given patients by the money which they earn, is Dr. Brown's great achievement.

How is it done?

In the first place, through the energy and ingenuity of his superintendent, he gets his milk, cream, eggs and butter direct from the farmer and without the intervention of any middleman. The village middleman tried hard to conceal the source of his supplies, but the superintendent scoured the country on horseback till he found it. This saving and the warmth of the climate are probably the chief elements which keep the total cost of care at Arequipa at \$7 a week,

DINING ROOM FIREPLACE

laundry included, the lowest figure that I know of in institutions giving a high type of care, such as Arequipa provides.

Next Dr. Brown succeeded through the commercial value of the pottery made by the patients. There are no invested funds and no income for the institution except the sale of pottery and the money paid in by friends of patients who are not well enough to work. Yet now at the end of its first year (October, 1912) there is no deficit and no debt. This is due chiefly to three people, Philip King Brown himself, Frederick H. Rhead, head of the pottery work, and Nora Harn-don, superintendent of the sanatorium.

Mr. Rhead came from Staffordshire, England (Arnold Bennett's country) and represents the fifth generation of potters in a single family. While head of the department of pottery in the People's University at St. Louis, he passed through San Francisco on a lecturing tour, fell

SOME OF THE OUTPUT

in love with California and with Dr. Brown's idea of self-support for tuberculous patients, agreed to give up his position and handsome salary in St. Louis and undertake the task of establishing a self-supporting pottery as part of Arequipa Sanatorium. All that he asked was a guarantee of his living expenses for six months. Within six months he said he hoped to make the work self-supporting; within twelve months he actually did so. This extraordinary success has been due to Mr. Rhead's expert knowledge of pottery, to his unusual skill as a teacher of untrained girls, to his genuine interest in the problem and to his tireless industry. At present the demand for the pottery exceeds the supply. San Francisco dealers are eager to get it and pay for it as soon as they receive it.

But are there no dangers to the girls' health in this work? None, I believe, under the careful medical supervision which they receive. A trained nurse, herself a patient, works in the shop and watches the effects of the work upon the girls. Each begins with an hour's work daily. Her temperature is taken before and after her work and if any fever follows work she is taken away from the shop and not allowed to go back till she can do so without producing any fever or other sign of overfatigue. The girls are paid by the piece, but few work more than four hours a day and none of them work on Saturdays or Sundays. In these few hours weekly, most of the girls can earn enough (after the first few weeks) to pay all their expenses at the sanatorium.

The dangers of clay dust and lead poisoning are avoided by cleanliness and an abundance of fresh air. The main work room is open on two sides and another work room on four sides. The climate makes it possible to do this work out of doors almost any day in the year. Moderate temperature, plenty of sunshine, no dampness or fog (such as San Franciscans have to bear in summer) makes Arequipa an ideal place for such work. Perched among live oaks on a hill side overlooking a beautiful valley, its lovely situation has no doubt an influence in keeping the patients happy and content.

Thirty-five acres of land for the sanatorium were given to Dr. Brown by Henry E. Bothin of Ross, a neighboring town. Mr. Bothin heard of Dr. Brown's project and was so much impressed by it that he called upon him and offered the land quite unsolicited.

Dr. Brown accepts as a rule only incipient cases. He has room at present for only twenty-three patients at a time. Yet here as in every other sanatorium it is hard to get them to give up work and face the task of treatment while still in the early stages of the disease. In the hope of solving the different problems of getting hold of the girls before it is too late to cure them, Dr. Brown has laid the matter before the organizations of employes in some of the San Francisco department stores, and these organizations have now established the precedent of paying at Arequipa the board of members of their organization who have acquired tuberculosis (after at least one year's membership in

the organization) and are not able to support themselves in the pottery.

The Pacific States Telephone Company has also maintained one of its tuberculous employes at Arequipa and indicated its willingness to do more. This sort of connection with the employes of large business concerns is one that is essential so long as the majority of doctors cannot or will not recognize tuberculosis in its early stages, and cannot or do not persuade patients to undergo sanatorium treatment.

The care of the tuberculous in California is still on a commercial basis. Except for the rich, there are only a few small sanatoria. The City and County Hospital in San Francisco admits

who supplied warehouses in many parts of the Pacific Coast and Middle West requesting a contract for a larger allotment of the output.

But to me one of the most impressive things about the Arequipa Sanatorium is the fact that it is the work of one busy doctor who raised the money to build it (about \$25,000) within a few months, and now superintends it by a weekly visit and many telephone messages. Building was started with only \$10,000 in sight. Yet now at the end of its first year the institution is in a flourishing condition and free from debt.

Indeed it has flourished so well that "cured" patients do not want to leave it and go back to stenography, telephone operating or house work.

PATIENTS  
AT  
WORK

so many tuberculous patients in the last stages that the death rate has reached 20 per cent a month. A hospital where one-fifth of your companions die each month is not an inviting place to go for treatment and in fact few go there if they can possibly help it.

I passed a considerable part of three days at Arequipa and during that time never heard a patient cough. I found the buildings of the best modern type, the table excellent and the patients more cheerful and lively than in any sanatorium that I can remember. The pottery that I saw them making was so beautiful that I could hardly believe that these unskilled girls could produce it. I saw a letter from a dealer

They prefer to earn their living in this beautiful and cheerful place by making pottery. Two such cured patients are now living in the neighboring village of Fairfax and coming daily to work at the sanatorium pottery. Just the right thing for them; just the way to prevent a relapse of the disease. But obviously if many girls did this, there would soon be no room in the pottery for patients still under treatment. Hence, Dr. Brown has been forced to turn away girls whom he would gladly keep in the pottery were there room for them without crowding out the patients.

This dilemma has suggested to him the build-

ing of a large pottery, distinct from the sanatorium workshop but under the same management. Here the apparently cured tuberculous patients, the deaf, the partially crippled and other handicapped persons will supply the labor and reap the benefits. Dr. Brown has no desire to employ healthy persons or to compete in the industrial world; he wants to continue the experiment of trying to make handicapped people

self-supporting, and he believes that if the tuberculous can supply the labor of a self-supporting pottery such as he is now maintaining, it must be possible to get as competent help from the deaf or from the other members of the physically handicapped group.

A Utopian project some will say. But is it more Utopian than what has already been established at Arequipa?

## HOUSING THE RUSSELL SAGE FOUNDATION

ROSCOE C. EDLUND

ASSISTANT TO GENERAL DIRECTOR RUSSELL SAGE FOUNDATION

**G**ROUND was broken in July for the Russell Sage foundation Building, New York, and concrete foundation piers are now being put in. When the building is completed all the departments of this organization which require office space in New York will be housed under one roof. Five and a half years ago the Foundation, then at the beginning of its work, had but two small offices. Two years later, although it was carrying on important investigations and assisting campaigns of education and improvement in many places, its regular staff occupied only four rooms. Now, with three departments on different floors of the Bank of the Metropolis Building in Union Square, with another occupying a floor in the Metropolitan Tower, and with two others, the library and the administrative offices, on three floors of the United Charities Building, the members of its staff, upwards of a hundred in number, look forward to being in closer touch with each other's activities in quarters specially designed for their work. The new building should mean increased efficiency in the Foundation's work and a wider and closer co-operation with others who are engaged in "the improvement of social and living conditions in the United States."

The departments of the Foundation include: the Child Helping Department, which is endeavoring to improve conditions surrounding dependent, neglected, and delinquent children; the Department of Child Hygiene, whose aim is to promote public health, recreation, and education, especially of children; the Charity Organization Department, whose aim is to promote the better organization of charities; the Division of Remedial Loans, which is conducting a campaign against loan sharks and encouraging the organization of remedial loan societies; the Investigation of Women's Work, which is gathering facts regarding the conditions of work of women in New York; and the newly organized Department of Surveys and Exhibits which will be a clearing house for advice and information on social surveys and exhibits. Space will also be provided in the new building for the administrative offices of the Foundation and for its editorial staff.

The site is the southwest corner of Lexington

Avenue and East 22d Street, diagonally across from the United Charities Building, where the central offices of the Foundation now are.

With a frontage of ninety-five feet on East 22d Street, the building has a depth of sixty-six feet along Lexington Avenue and runs back to the Princeton Club, which occupies the rest of the street front between it and Gramercy Park. A large court to be cut from the southwest corner of the building above the first floor, together with a small open area adjoining the Princeton Club on the west, assures to every room abundant light and air.

The building is to be nine stories in height, but the substructure will be made strong enough to bear three stories more in case the work of the Foundation expands so as to make this additional space necessary. It will be constructed of Kingwood sandstone, a light brown stone with a pinkish tinge that as yet has been used for only one building in New York, the Synod Hall of the Cathedral of St. John the Divine now under construction. The blocks will have the natural rough face with deep rustication. The architect, Grosvenor Atterbury, is also the architect of Forest Hills Gardens, the suburban development of the Russell Sage Foundation on Long Island. The design of the building is in restrained Florentine style. There is little ornament save the shield above the main entrance and shields around the second story. Loggias overlook the street from the library in the two upper stories.

On the main floor of the building along the Lexington Avenue side will be a lecture room with a hundred seats and outside entrance to the street. The south side of the floor will be occupied by a large exhibit hall. The platform in the lecture room will be movable and the two halls may at any time be thrown into one, ready for a lecture, an exhibit, or a reception.

Offices for the departments of the Foundation, committee rooms, and workrooms, will occupy the second, third, fourth, fifth, sixth, and seventh floors. In the eighth and ninth stories will be the library. On the ninth or mezzanine floor will be a lunch room and a rest room for women. The roof will be arranged for various uses. The building is to be fireproof, with a fire-tower separated from it by brick walls.

A CHECK, A CARTOONIST, AND A CHARITY ORGANIZATION SOCIETY

## LABOR, IDLENESS AND IMPRISONMENT

Condemning the contract system but declaring that even contract prison labor is preferable to idleness, the special committee created at Omaha a year ago by the American Prison Association made report at the recent annual meeting in Baltimore. The Maryland Penitentiary was cited as an illustration of the evils of the contract system. A combination of the state use and state account systems was recommended.

It will be recalled that this committee was appointed last year in spite of the fact that prison labor did not appear on the program of the association, and only in response to a strong undercurrent of feeling that was brought to the surface by an appeal from Kate Barnard, commissioner of charities and correction of Oklahoma, who urged the association to investigate this subject. Frederick H. Mills, sales agent of state prisons of New York, was made chairman. The five other members were Joseph P. Byers, secretary of the New Jersey State Charities Aid and Prison Reform Association; Miss Barnard; Samuel Gompers, president of the American Federation of Labor; J. T. Gilmore, warden of Central Prison, Toronto, Canada; and Albert Garvin, warden of the state prison, Wethersfield, Conn. Nothing was said about the continuation of the committee, whose investigations were to extend over one year. The association adjourned this year without reappointing it.

Three evils in the contract system were singled out for mention in the committee's report:

In making such a contract, the state abdicates the very position which gives it the right of relationship as a police power.

It uses the sovereign power of the state to encourage unfair competition with its own citizens.

It loses control over the integrity of the prisoner as a workman and the power of dictation over the integrity of his work.

The report declares that the employment of prisoners should be directed entirely by the state and that the products of their labor should be disposed of by the state, and takes the position that

"it is possible for every state having a population of 2,000,000 inhabitants or more to employ all its convict population in manufacture of articles for the use of the state and its political divisions."

In support of its argument for the state use system, illustrations were drawn from New York where it was introduced fifteen years ago in the state institution. It will be recalled by SURVEY readers that a special commission, appointed by Governor Dix to examine the department of state

prisons in New York last spring has criticised the methods of administering the law on the ground that while it created a potential market for prison products, amounting to \$20,000,000 a year, the prison administration had failed to develop this large market or contest with private purveyors for important lines of government supplies.<sup>1</sup> The present committee, in passing on this situation in which its chairman is the central figure, makes answer that the law contemplates primarily the employment of the prisoners and that the sale of the product is incidental. "It is not the intention of the law that the prison should reach out for more than enough work than is necessary to keep the prisoners employed," it declares.

The committee illustrates the state account system by a description of the Minnesota State Prison at Stillwater, where this system was introduced in 1891. Since then the profit to the state from the binder twine plant alone has been over \$1,600,000 and the prisoners have earned from ten to fifty cents a day, according to their diligence and ability. Meantime, criticism has been directed against the state account system as applied there, both on the ground that the work does not fit the prisoners for productive labor once they are liberated and on the ground that it is not right that the state should realize a profit from the labor of convicts who themselves receive but a pittance. In answer to the second point, the report says:

"If the convict is employed in quarrying rock or some other equally unproductive labor, the state is put to a large expense for the maintenance of the prison, but then there are no critics to charge the state with robbing the unfortunate convict of his rights. But, let the state establish a modern industry, whereby it may employ its convicts on productive labor and by the profits of this industry support the institution without calling upon the taxpayer to foot the bill, even though that labor may be much less tedious than the monotonous rock-breaking and of much more value to the convict, and what is the result? The whole system will be criticised by those who have not taken the time to make a study of the prison labor problem. Their whole argument is based on the false premise that it is wrong for the state to receive any profits from the products of the prison labor. The compliance with this premise would result in inefficiency while efficiency is the keynote of our modern industrial system."

There seems to be something of a gap between this reasoning and that quoted with reference to the New York administration.

The final recommendation of the committee on the question of prison labor is as follows:

"The prisoners in every state should be so classified and grouped that labor, always directed

<sup>1</sup>See THE SURVEY for April 13, 1912, p. 94.

by the state, can be provided suitable to the needs of each class of prisoners. A certain proportion of prisoners in each prison should be employed at farm work, road building, erection and other outside work. Another, and larger group, including all the remaining population, should be employed at productive industries in the manufacture of general merchandise, selected both with a view of trade instruction and utility of product. The products of such employment should be sold to and used by the state, so far as possible, and wherever the needs of the state are not sufficient to absorb the product they should be supplemented by products that can be used within the state where they are manufactured."

At this point the report trenches on the old line of conflict between prison administrators and the labor unions. Both the prisoner and the free man are regarded by the committee as having a right to work. The problem of prison labor, therefore, says their report, becomes one of adjustment to the right level. "This adjustment can only be made by the state and whenever it surrenders its control of this adjustment, it does an injustice to all its citizens."

In singling out the Maryland penitentiary as probably the best example of a highly developed contract prison in the country, the committee quotes the annual report of the warden of that institution to the effect that the prisoners had earned during the twenty-four years of his incumbency practically the same amount—over \$500,000—which had been paid into the state treasury. The committee then points out that whereas it is usual to employ from 20 to 33 per cent of the whole number of prisoners in the upkeep of the institution, only 7 per cent are so engaged in the Maryland institution, the other 93 per cent being on contract. No time, it is declared, is allowed for relaxation, "and the work hours are limited only by sunlight." The pay received by the prisoners is then shown to have been given them at the expense of certain necessities which are supplied to the prisoners free of charge in some other states. The amount of money given to discharged prisoners in Maryland averages much less than elsewhere, and the difference in the total cost of these items makes up, the report says, nearly the amount of money turned over last year to the state. On the opening evening Governor Goldsborough told the delegates that he had recently appointed a commission to investigate the Maryland State Penitentiary and to present a plan for modernizing prison methods in the state. The governor declared his unalterable opposition to the contract labor system.

While the discussion of prison problems at the recent conference of governors at Richmond, Va., with its flare up on lynching by Governor Cole Blease of South Carolina and its subsequent disavowal of his position by the other gov-

ernors, including several from his own section of the country, attracted a wider publicity in the newspapers, it did not take the wide range afforded by the program at Baltimore. Feeble-mindedness in its relation to penology was exhaustively discussed. It was declared that there are 200,000 feeble-minded persons in the United States and that fewer than one-third are in institutions. A disproportionate share of these seem to have been placed in penal institutions, for Hastings H. Hart, director of the Department of Child Helping, Russell Sage Foundation, estimated that 25 per cent of the adult prisoners in state prisons are feeble-minded. In many juvenile institutions, he said, the percentage runs as high as fifty and he cited one institution in which it reached sixty-eight. The number of feeble-minded women who secure husbands, it was declared, is three times that of feeble-minded men who secure wives and feeble-minded women of child bearing age should therefore be our first care. More thorough psychological examination of all law breakers was urged by such specialists as Henry H. Goddard of the New Jersey Training School for Feeble-minded, William Healey of Chicago and Warden Fernald of the Massachusetts Reformatory. Their demand was insistent that those who are shown to be sub-normal mentally must be segregated in institutions for permanent custodial care. There is still reluctance on the part of many wardens and superintendents, however, to accept the conclusions of these men concerning the extent and nature of feeble-mindedness in criminals.

The value of outdoor work on farms, roads and buildings was a matter of general agreement among the prison administrators. The inebriate is in especial need of the sun and the open air.

In this connection, it was contended that the honor system, even in case of short time prisoners in workhouses, is entirely practicable. This system does not mean that men must be trusted a hundred miles away from the prison, though this has been successfully done in Oregon. From many parts of the country came wardens who told of daily trusting several hundred men on work close to the prison without attempts at escape. Kansas, Washington, Colorado, Arizona and the District of Columbia are only a few of the states which have recently adopted this plan. At Comstock where Warden Homer is in charge of the latest New York state prison, a Saturday afternoon ball game has become a regular reward of good conduct on the part of those so trusted.

### SOCIAL INSURANCE AND THE "DOCTOR'S FUTURE"

Abraham Jacobi, trustee of the New York Academy of Medicine, a physician who can look back on a long life of activity in progressive movements in medicine and out, warmly congratulated the academy at its recent anniversary meeting on having fallen in line behind the economist and the reformer. Indeed, the drift of the papers at this session on the "doctor's future" was nothing less than an advocacy of making medicine a part of statecraft and the doctor a public servant of infinitely more importance to the commonwealth than the politician in Congress. Ideas travel fast, and both speakers of the evening, Charles L. Dana and Algernon L. Bristow, laid down as a pattern suggestive for America the system of social insurance which has recently gone into effect in England.

Dr. Dana saw in the future a general practitioner whose work should be largely prophylactic. Working in co-operation with him, he saw a body of specialists very much larger and better equipped than we have to-day, who should get their training through a perfected hospital system in use by practically all the sick. He noted that already the tendency toward institutional care in sickness is well under way; and he noted also that such care, or care by the nurse in the home, is beginning to supplant cure by drugs, and that a decrease in the number of physicians is being accompanied by better training of those who graduate from the medical schools.

The physician of the future, Dr. Dana believed, in his prophylactic function, should have the care of more than merely the living individual. He should be the great eugenicist, the Æsculapius who would appear side by side with Venus in every true and realistic love story, to protect the race yet unborn. The prophylaxis of the physician-statesman of the future, would be still broader; he would be the public sanitarian. The food and drug supply would come

under his supervision, and he would supervise conditions both of labor and of recreation.

Dr. Bristow discussed that development of the medicine of the near future which both he and Dr. Dana considered the most important—social insurance for those whose very poverty makes the family physician an impossible luxury, and who today have to fall back upon the medical benefit society for such half care as it gives in time of illness. In the single state of New York he showed that two races alone, the Jews and the Italians, have three hundred thousand members in sick benefit societies. The only alternative that the future offered to people thus circumstanced was, he believed, to depend on the overworked, ill-paid, inefficient lodge doctor, or to provide mutually for themselves through social insurance.

For the physician himself he believed that social insurance held no menace, but, rather, a promise of a surer means of earning a livelihood.

### BRITISH SOCIAL INSURANCE AND THE DOCTORS' UNION

The interesting negotiations between the British Medical Association and the Chancellor of the Exchequer, with respect to the provision of medical service under the new Insurance Act<sup>1</sup> reached in November a point where the government made a compromise offer to the doctors organized in the British Medical Association. The offer was rejected and the association has been allowed till January 15 to confer with the government on the points at issue.

The alternative in case of failure to come to an agreement on that date is the development of a state medical service to serve the great groups of men and women who are insured under the act. The terms of the rejected offer itself are so much better, from the standpoint of the doctor's pocketbook, than the original proposal of the government as to show the effectiveness with which one of the old professions can adopt union methods. The total amount which the compromise offer proposed to pay annually for each insured person was 7s. for the doctor, 1s. 6d. for drugs, and an additional 6d. to be used for drugs if needed, otherwise added to the doctor's fee. This would be a total of \$2.25 per annum per capita, and in addition there would be a separate fund to meet epidemics involving an abnormal demand for drugs. This improved pay would, however, be given for improved services.<sup>2</sup>

The doctors were, according to the government proposals, to issue certificates to enable insured persons to secure sickness or disablement benefit; they were to keep records of patients and of illnesses, and the commissioners were to be responsible for a heightened standard of treatment

<sup>1</sup>See THE SURVEY for September 7, 1912, p. 691.

Jacksonville Metropolis.  
"NUF CED."

Sid Turner in the Newburgh Journal.  
IF—

#### AT THE COUNTER AND THE SHOW WINDOW

and for surer diagnosis. If these terms cannot be amended to the satisfaction of the association, a state medical service is to be organized, which Lloyd-George has sketched as follows as applied to a town of 200,000 inhabitants:

"At the head of the service would be a principal medical officer, who would be responsible for the working of the service and would be not only a skilled clinician thoroughly competent to supervise and appreciate the work of his subordinates, but also a highly efficient administrator. Immediately under him would be a staff of skilled specialists, who would help the general practitioners of the service in any case of difficulty. Then would come the general practitioners of the service, of whom some would be junior practitioners, and others senior practitioners of wide experience. These would work on an organized system, proper provision being made for night calls and other emergencies, and they would be assisted by an efficient staff of nurses. Their work would be done under competent supervision, and they would be able promptly to secure skilled assistance in cases of difficulty. Such a service would naturally work in close co-operation with the public health authority and the education authority."

The *London Nation*, commenting on the proposals of the government, even as they now stand, calls them undeniably generous. They would insure an income of \$2,450 for every thousand insured persons, which sum includes extras and

mileage. It is estimated that one doctor could well do the necessary work in a village of moderate size which, with surrounding hamlets, might number two thousand souls. His income would be increased by at least a part of the 6d. allowed for additional drugs if necessary, and there is also the maternity benefit, a part of which goes to the doctors for their services.

The *Nation* predicts that for the doctors to continue resistance and thus permit the inauguration of a state service will spell ruin to their association, a collapse of the organization, and an internecine war, the effects of which will endure for years. Acceptance of the terms with such amendments as the government can afford to accede to, even though it involves a surrender of some minor details, means, on the other hand, to quote the *Nation*, a triumphant and early success of the largest measure of social reform that England has ever seen.

#### DOPE, DIPLOMACY AND A DELIBERATIVE CONGRESS

In his first message to Congress this year, President Taft called especial attention to the fact that Congress has been overnegligent in its attitude toward the anti-narcotic legislation which has been before it for some time, the passage of which he recommended in an earlier communication. The situation is a curious one, and

illustrates the slow acting nature of the federal law-making body. Moreover, it is an internationally embarrassing one, since this government took the initiative in the International Opium Conference of two years ago, and is now affording the spectacle of refusing to do its share of work in the establishment of a reform which its diplomatic representatives have ardently advocated.

There are now before the lower House two bills recommended by the International Conference. Both these measures were introduced in June, 1912, by Representative Harrison of New York. One provides that a heavy internal revenue tax shall be levied upon smoking opium manufactured in the United States; the other imposes a tax upon and regulates the production, manufacture, and distribution of opium, morphia, coca leaves, cocaine, chloral, cannabis, their salts, derivatives, or preparations. It is believed by experts that the passing of these bills would do much, to use President Taft's words, 'to correct the deplorable narcotic evil in the United States.' He further points out that they have behind them "not only the moral sentiment of the country, but the practical support of all the legitimate trade interests likely to be affected."

#### BOOKS AND PRISONERS

Plans are on foot for the establishment by the New York Public Library of carefully selected branch libraries in the penal institutions of the city. In many of these the inmates remain only a short time, but there are at least six in which residence is for a period long enough to make consecutive reading among well-selected

books quite possible. It is not unusual for city libraries to maintain "traveling libraries"—sets of books regularly replaced by other sets—in jails or prisons, but so far as is known, no place has yet established actual branches such as are scattered about the larger cities for use by local neighborhoods. Various plans for the supervision of the proposed branches have been suggested, one being the appointment of a superintendent to have general charge of all with "trusties" as librarians in each branch.

The need of the man in prison for wholesome and informing reading matter, and the deplorable scarcity in our prisons of books answering that description, as well as the availability of trashy or unsuitable material, are forcibly brought out by Miss Curtis elsewhere in this issue. An interesting corroboration of her conclusions is furnished by an intensive study made recently by Frederick W. Jenkins, librarian of the New York School of Philanthropy library, of some of the penal institutions in New York and read at the recent meeting of the New York Library Association at Niagara Falls. Comparison was made at this conference between the prison library and the prison school, which in many places has been raised to a reasonable degree of excellence. The prisons of New York state have paid citizen instructors in charge of their schools. Yet it was pointed out that the library is often guarded by an ignorant convict who exercises his small power autocratically. Not only the place of long detention needs books, it was said; the men in the jails must be allowed to read also. Here was declared to be a splendid field for co-operation with local public libraries.

Mr. Jenkins found that the books at the work-house and the penitentiary on Blackwell's Island were the best of the collections, but still nearly worthless. Of the 650 books in these two places the only ones of value, he declares, are a few novels given by the New York Public Library. Fully 90 per cent, he goes on,

"are of the Sunday school story type of fifty years ago. They have been donated by persons at the time of some house-cleaning or house-moving period—The Next World Interviewed; Angel's Song; Little Prudy's Dotty Dimple; School Girl's Garland (published in 1864); Above Rubies, a Memorial of Christian Gentlewomen; Which: Right or Left (published in 1859); Thoughts on the Death of Little Children (published in 1861); How Readest Thou (published in 1854); Violet's Idol; Wheat or Chaff (published in 1853).

After expressing the hope that the time is near at hand when the person in charge will have power to destroy as well as to save books intended for prison readers, Mr. Jenkins utters this anathema:

"I trust some dire end awaits those people who send their gifts, often utterly worthless material,

to the prison and the reformatory. There is nothing worse than this, unless it is the act of him who goes in person and distributes thousands of sheets of religious literature, reminding the man to whom it is given of the number of talents which he has wasted. I have listened to the flatulent remarks of such people. Men and women of this stamp and the books which they give constitute the most serious menace to good work among prison libraries. Much of the so-called religious literature distributed is absolutely worthless, unreadable by the inmates, and represents sheer waste of time and energy on the part of the distributors. Worse than this, the broadcast distribution of leaflet and pamphlet makes extra work for the prison officials. It is thrown unread on the floor and adds hugely to the waste matter that must be removed. Is it any wonder that the warden does not welcome the general diffusion of literature? All this should be stopped, and no distribution made except through the library."

In answer to the question, What books are really needed? Mr. Jenkins enumerates three kinds; first, those aiming to teach English to foreigners. This applies especially, of course, to institutions where there is a considerable percentage of immigrants, such as the prison on Blackwell's Island, where there are many Italians and Germans. Not a single book teaching English to Italians is to be found there, yet the half dozen German books have been read out of their covers. Mr. Jenkins's second suggestion is vocational books, dealing with plumbing, stenography, carpentry, etc. It is for these two classes, he finds, that there is the greatest demand from prisoners. Third, he emphasizes good novels—"novels of real life without a moral printed on every page, dealing with real people under real conditions." Finally, he urges that the desires and tastes of the men themselves be studied. Let the library represent an intelligent response to an ascertained demand. Three hundred volumes, he thinks, is enough for the shelves of any prison. A printed catalogue should go into every cell, and it should contain an invitation to the prisoner to make his reading wants known. In conclusion he says:

"Of course, no appeal, however sincere, can reach all or even the great majority, but it may go far. I am told that the men sometimes mutilate the books; so do the readers of any public library. I am told that they underline certain passages of personal interest; not all who do this are in jail. And finally I am told that the men show their disapproval for some of the literature handed out to them by spitting in the book and calmly returning it. In polite society this could not be countenanced, but after an examination of the library on Blackwell's Island, I am of opinion that such an act shows a valuable power of discrimination; it is proof that the man doing it is capable of and deserving of something better."

## BROADENING INDUSTRIAL EDUCATION

WINTHROP D. LANE

Any change in our educational system is the vital concern of the social worker. Among the changes proposed at the present time, none is perhaps more drastic than the one vaguely described as industrial or vocational education. The philosophy back of this suggestion, and others growing out of the same observed social needs, is that education, taken in its broadest sense, is co-extensive with environment. In this view, education ceases to be a mere preparation for life and becomes life itself, to use a phrase made current by Prof. John Dewey. It is this philosophy which is increasingly leading educators, social workers and others to try to recast the public educational system so that it will offer to a maximum degree the actual environment of life.

Where in this scheme of recasting does vocational education take its place? Distinction should be made between what are called prevocational and vocational instruction. One of the proposed means of securing greater harmony between the public school system and the actual environment of life is the making over of the elementary curriculum to include, side by side with reading, writing and arithmetic, training in manual dexterity, in the purposes and use of tools, and perhaps in some of the elementary processes which may be found to underlie modern

trades. The need for and nature of such prevocational instruction, the purpose of which should be not to fit for specific vocations but only to secure a more all-round development of the child during the age of eight or ten to fourteen, were discussed in the recent conference held in New York.<sup>1</sup>

Another proposed means is that of real vocational education, the purpose of which shall be to fit for successful wage-earning occupations, and which shall begin where elementary education stops for large numbers of American children, namely at the age of fourteen, and continue for two or four years, as may be found necessary.

This second proposal was thrashed out at the sixth annual meeting of the National Society for the Promotion of Industrial Education, last week in Philadelphia. In spite of the phrase "industrial education" in the title of the society, it was vocational education which was discussed and which was defined to include the following three forms of specialized training, the controlling purposes of which are to fit for useful occupations; industrial education, designed to meet the need of the manual worker in the trades and industries; agricultural education, which fits for occupations connected with the tillage of the soil and the care of domestic animals; and household arts education.

The facts showing the need for instruction of this sort are substantially the same as those cited to prove the need for prevocational instruction, namely the glaring unfitness of boys and girls who leave school at fourteen to do the work which nearly all of them go into, with the consequent shifting from job to job where nothing is learned and advance is impossible. A hopeful sign at Philadelphia was that these facts were taken for granted. No one thought it necessary to demonstrate the need for vocational education.

Few thought it necessary, moreover, to question the purpose of the education to be given. Debate was chiefly over the machinery for administering it and the training of teachers to impart it. It was generally assumed that the purposes of vocational education, beginning at the age of fourteen, shall be to fit for specific and limited occupations, such as plumbing, tin-smithing, dairy farming, etc. There was little, if any, reference to the suggestion that perhaps what the boy or girl of fourteen, who has had only such elementary instruction as the present school system affords, most needs is greater training of the brain through the hand, greater training of observation, of ingenuity, of imagination and even of logical thought through a general acquaintance with materials and machines. It seemed also to be taken for granted that one's bent is quite determinable at the age of fourteen,

in spite of the fact that Prof. George M. Forbes of the University of Rochester described how only fourteen out of eighty-three boys who had received fairly adequate instruction in specific vocations in a Rochester school were later found to be following the trades which they had there learned. Criticism of the discussion on these grounds was accompanied by the further suggestion that even if we are to train youths of fourteen for specific occupations, we have not made a sufficient study of industry to decide what should be the content of vocational courses, nor just what it is that rapidly changing trades require to be taught; the point being that it is perhaps unwise to set up an elaborate scheme for teaching something until you know what you are to teach. The answer made to this was that a beginning must be made, as it already has been made where such schools have been established, by teaching what is actually done now in the factory, the shop and on the farm, and that the broader educational content of the courses will then be worked out as industry is more intensively analyzed and the common elements of trades are discovered.

Among the teachers, school administrators, social workers, manufacturers and law-makers gathered together in Philadelphia there was practical unanimity of opinion that vocational education aiming to fit for trades must be publicly provided for and that this provision must be made jointly by the states and local communities. In a statement of principles advocated by C. A. Prosser, secretary of the society, and later adopted by the members, it was held that local communities should be permitted, if they so desire, to initiate and maintain schools entirely apart from state support and supervision, yet it was declared that state aid would be found necessary to stimulate and encourage them. The amount of state aid should be, in general, sufficient to furnish this encouragement and to justify participation on the part of the state in control and administration, but not large enough to sacrifice local initiative. Both Mr. Prosser and Edwin G. Cooley, former superintendent of schools in Chicago, thought that the best results are secured when the local community is required to furnish the school and equipment and pay one-half of the operating expenses. This also was embodied in the statement adopted.

Chief among the questions relating to the machinery for teaching vocations was that which asked whether it is better to set up vocational schools as integral parts of the present secondary school system, or as a dual system provided for by distinct laws, under distinct supervision, housed separately, and having nothing in common with the present school system except public support. John A. Lapp, secretary of the Indiana Commission on Industrial and Agricultural Edu-

<sup>1</sup>See THE SURVEY for November 23.

cation pointed out that Massachusetts began several years ago with separate schools under separate boards, both state and local, but changed to permit either a separate school or a school as an integral part of her former system. Wisconsin has adopted the separate school idea and such a plan is proposed in Illinois. New York, New Jersey, Ohio and Maine on the other hand, make the work a part of their old systems. This is the recommendation of the Indiana commission of inquiry appointed last year.<sup>1</sup> On behalf of the separate school Mr. Prosser urged that that plan leaves the vocational school freer at all times to realize its dominant aim of preparing for definite occupations. In justification of joint administration Mr. Lapp thought that it is easier to modify existing school courses to meet vocational needs than to create new courses and that greater harmony in public education will result. The one-system plan is favored by the majority of educators connected with the present school system, a notable exception being Mr. Cooley. The trend seems to be in its direction.

Whatever the system of administration, the vocational school, it was insisted, must approximate the actual conditions of the workshop, the home and the farm. If it be an industrial school, it must forego the formal air of the school room and realize the freedom which surrounds the bench and lathe. In the accomplishment of this, of course, the teacher will be the vital factor, and so there was earnest debate over the kind of teacher required for this new type of instruction.

Emphasis was laid on the need of teachers who can make competent craftsmen of their pupils. Mary Schenck Woolman, president of the Women's Educational and Industrial Union, Boston, and Florence M. Marshall, principal of the Manhattan Trade School for Girls, New York, who spoke from the standpoint of girls, together with David Snedden, commissioner of education for Massachusetts, and Charles R. Allen, agent of the Massachusetts State Board of Education, who spoke from the standpoint of boys, were united in the opinion that so far no satisfactory method of producing such teachers has been worked out. "At present," said Mr. Snedden, "we are obtaining teachers much as the early settlers obtained their food—we are trusting to an accidental and variable supply produced by no effort of our own." All four of these speakers agreed that they can not be secured by drawing on the regular public schools and giving a little additional training to the instructors there found, nor can the present normal schools turn them out. They must be trained specifically to meet the pedagogical demands of the vocational school, which has problems peculiar to itself. We shall have to go direct to the industries themselves, said Mr. Snedden, and select experienced workers with a gift

for teaching. For such workers we can then provide evening courses of instruction in such pedagogical problems as the organization of courses, methods of instruction and class management. Attendance at these classes can then be followed by employment as assistant teachers in actual vocational schools. Thus a normal training will be added to craftsmanship. In the evident distress over the failure so far to secure even good instructors in trades, it seemed to be regarded as unimportant that the teacher should be alert to the cultural value of all work; that he should keep his students' minds open to the onward movements in the conservation of material and in mechanical invention; that his personality might become as vital a factor in success as that of the teacher of history, literature and language.

A final point under discussion was one which has long been the subject for debate in connection with industrial schools in reformatories. What shall be the output of the vocational classes and how shall it be disposed of? Shall it be commercial, and sold on the open market in competition with other products, the proceeds of the sale being used to defray school expenses? Helen R. Hildreth, director of vocational training for the Women's Educational and Industrial Union, Boston, and E. H. Fish, director of the Worcester Trade School for Boys, Worcester, Massachusetts, urged that only by making commercial products can the schools supply those conditions to which the successful wage-earner must be accustomed when he leaves. The work of the school must be put upon a business basis, said Mr. Fish. Miss Hildreth went so far as to insist that products should be turned out for which definite orders have been taken. To this Harry S. Bitting, president of the Williamson Free School of Trades, Pennsylvania, objected that when a contract is entered into, the fulfilling of that contract then becomes the absorbing aim of the instructor and his attention is diverted from the primary task of teaching. Discussion at Philadelphia failed to bring agreement and the question is evidently an open one. The experience of our prisons, now slowly adopting the plan of selling their products back to the state and its political divisions, may hold a suggestion for the vocational schools of the future which shall find created wealth hanging heavy on their hands.

## WHAT THE CONVICT READS

FLORENCE RISING CURTIS

Instructor University of Illinois Library School

There are about fifty thousand men and women in the state and national prisons and reformatories of the United States. Under the operation of the present laws, from 70 to 80 per cent of these are confined from one to ten years, at the expiration of which they will

<sup>1</sup>When ready, copies of their report may be secured from Mr. Lapp, State Library, Indianapolis, Indiana.

come out into the world again. The prison doors are opening daily to the man who is going out with the prison label still upon him, for the new clothes taken from the piles in the outfitting room are recognized at once by both the policeman and the saloon-keeper. Ignorant, untrained and uncontrolled, he came into prison chafing at the "hard luck" or the "spite" which had put him behind the bars. Detaining him for one year or for ten has made little difference, if he comes out with the same standards of conduct, the same ignorance and lack of control.

When the evening and Sunday hours may not be spent in handicraft, the prisoner eagerly avails himself of the opportunity for reading. The circulation per capita of the books in the prison libraries is largely in excess of that reported by the public libraries of the country. Books serve to occupy his mind during the long silent hours of the day; the scenes are lived over again, the arguments debated, the characters of the history, biography or novel are real companions to these men taken away from neighborhood and family life.

If the prison library has been the dumping ground for gifts of literary rubbish, if the books which are purchased are cheap in tone as well as in price, if the language is vulgar, the characters and situations low and suggestive, the prison is providing bad company and poor ideals for the men who are sent there for correction and reformation.

A study of the catalogues of twenty-three prison libraries shows that this is a matter which should receive attention. These were limited to no one section of the country, eight being in the East, twelve in the Middle West, two in the West and one in the South. With few exceptions, they are far below the grade of the average public library of the same size; the classes of history, biography and travel, which should be especially strong, are often filled with out-of-date and unreadable books. It is surprising that detective stories figure largely in the fiction lists, for it would seem dubious policy to furnish stories of crime which suggest ingenious plans and point out the weak spots in the method of their execution.

Books which emphasize sensual details are surely not good mental food for men taken out of normal human intercourse and shut away with their thoughts, yet the prison libraries contain the novels of the modern "realistic" writers: Lucas Malet, Robert Herrick, Robert Hichens, David Graham Phillips, Robert W. Chambers, George Gibbs and many others. Elinor Glyn's *Three Weeks* is probably not on the shelves of a single American public library, but it is listed in three of the twenty-three catalogues examined. Such books as George Moore's *Evelyn Innes* and

Sister Teresa, Anatole France's *Red Lily*, and Smollett's *Peregrine Pickle* and Roderick Random, interesting and often harmless to some, are of questionable moral tone for such readers. Fiction of inferior merit, with characters and situations often at variance with real life, fills page after page with such alluring titles as *Wife in Name Only*, *Between Two Sins*, *Maid, Wife, or Widow*, *A Woman's Temptation*, *Sharing Her Crime*, *Lost for a Woman*, *The Changed Brides*, and *A Beautiful Fiend*.

The make-up of the prison library catalogue is seldom good; of those examined, only fourteen were classified and in many cases the divisions were too general to be of much value. Two were arranged only by author, four by title only; two had no authors given, and one of these was arranged in the order of the receipt of the books. In many catalogues the printing was poor and the entries inaccurate. In one, the books seemed to have been classified by the sound of the title as the section of "Religious Books" included *The Sorrows of Satan*, *The Breath of the Gods*, *The Conquest of Canaan*, *The Little Minister*, *The Choir Invisible*, and *The Fruit of the Tree*.

The tabulation which follows shows the result of an investigation of these twenty-three library catalogues, applying to them the same tests that a librarian would use in judging the catalogues of as many public libraries. In the cases where a large section was labelled "Miscellaneous" or "General," the lists were gone over carefully, in the effort to decide the character of the books which belonged to each particular class named in the table. The libraries listing no foreign books are in states where it is probable that some foreign nationalities are represented in the prison population.

THE LIBRARIES OF TWENTY-THREE AMERICAN PRISONS

	CHARACTER OF BOOKS					NUMBER OF LIBRARIES
	Good	Fair	Poor	None	Few	Many

Magazines .....	4	5	7	7	4	
Fiction .....	2	6	15		2	2
In Foreign Languages ....	4	6	6	11		

These libraries have received in bulk a large number of the old Sunday School collections of out-of-date religious and temperance books; they are decidedly lacking in readable informational literature—biography, travel, science and books on present-day invention and progress. Such literature is especially needed here, for it is the experience of those in charge that prison men tire of stories, and crave more solid reading.

## INTERSTATE IMMIGRATION, LAND AND LABOR PROBLEMS

FRANCES A. KELLOR

Chief Investigator Bureau of Industries and Immigration,  
New York Department of Labor

Following the three interests represented in its organization the National Conference of Immigration, Land and Labor Officials,<sup>1</sup> representing thirty-eight states, is now at work on a federal bill to be presented to the new administration, creating in the department of labor, which it is hoped will become a fact during this session of Congress, a bureau of distribution which will deal with interstate immigration, land and labor problems, and which will co-operate with the various states in their work within state limits.

This bureau will be concerned wholly with matters in this country. In matters of immigration it will include the supervision and protection of admitted immigrants in transit and the establishment of branches of the bureau for this purpose at re-distribution centers; the licensing and regulation of steamship ticket agents doing an interstate business; the distribution of school children's names from ports of entry to school authorities, and the investigation and adjustment of interstate complaints and difficulties which now arise. That this latter field is large is seen from the fact that in the past year the New York State Bureau of Industries and Immigration has been called upon in hundreds of cases to adjust matters between residents of California and Pennsylvania, and between the North and South in such matters as steamship tickets, lost baggage, lost relatives, colonization, employment contracts made in the agencies in one state and consummated in a far distant state.

In the matter of labor, it is proposed that this new bureau shall include and extend the work of the present division of information, which now has one branch office in New York for distributing labor; shall license and regulate all private agencies doing an interstate business, and shall favor and co-operate with state free employment

bureaus in furnishing a reliable governmental clearing house for labor.

The enormous frauds now practiced by some land and colonization companies and the inability of the states to reach settlers and farm laborers make it necessary for this proposed bureau to have the power and facilities for registering and furnishing information on lands offered for sale. The bureau is also confronted with the need of working out some plan of having the federal government adopt a method of providing long-time, low-interest loans to settlers for the purpose of aiding them to purchase land and make improvements on it or to discharge indebtedness on the land. It also proposes to make an investigation of such governmental methods in use elsewhere.

All of these matters are interstate, and no existing bureau is dealing with them. They are fast becoming difficult problems to handle. This bureau will have the opportunity to work out real measures for the relief of congestion, at the same time safeguarding the persons distributed and making state connections which will give them a fair chance for prosperity.

In its program for state activities the conference set itself the task of making a study of existing governmental agencies in the states and in co-operation with state authorities to secure sufficient appropriations, and new legislation for whatever is needed. It will endeavor to have established bureaus of labor where none exist, and bureaus of immigration where needed. It has adopted minimum standards for the establishment of free employment agencies and the regulation of private agencies. It is also at work on means of getting the settler upon the land, and of safeguarding him in his purchases and settlement. In this respect it has taken up the matter of state advertising, the registration of lands for sale, the approval of form of contracts for the sale of land, the inspection of advertising material and prosecution of fraud and the publication of accurate information concerning the land for sale.

The need of a standard and the extension of this state work in order that there may be co-operation between the federal and state governments, may be seen from the fact that no state now safeguards purchasers of private lands, nor adequately reaches the settler through its present advertising. Sixteen states have free employment bureaus, with no means of co-operation between them; eighteen states regulate private employment agencies, though in nearly one-half of these only a license fee and bond is required and there is no inspection provided for enforcement of the law; thirty-five states are dealing with the problem of labor with the greatest variation in scope, powers and appropriations. One state has an industrial commission; six have

<sup>1</sup>The officers and executive committee for 1912-13 elected at the second conference of the organization held in Chicago in November were:

Honorary President: T. V. Powderly chief of the Federal Division of Information, Washington, D. C.

President: John R. Commons, member Wisconsin State Industrial Commission, Madison, Wis.

Vice-President: J. F. Denochand, secretary, Louisiana State Board of Immigration, New Orleans, La.

Treasurer: Charles F. Gettemy, director, Massachusetts Bureau of Statistics, Boston; and

Secretary: Frances A. Kellor, chief investigator, Bureau of Industries and Immigration, Department of Labor, New York.

Members Executive Committee: Robert N. Lynch, member California Immigration Commission, San Francisco; John Nugent, commissioner of Immigration in West Virginia, Montgomery; Charles Harris, director Kansas Free Employment Agency, Topeka.

labor departments; eleven combine labor, industry, commerce, agriculture and immigration in some form or are limited to statistics and factory inspection. Seventeen, including some of the largest industrial states, operate as bureaus of labor statistics, some of them under limited and obsolete laws, exceeding their powers to meet the situation where there are able men at the head, or falling back on the limitations of the laws where special interests control them. Some of the labor bureaus are purposely crippled in appropriations and exist chiefly on paper.

The conference hopes to be able to establish four centers, under the supervision of its secretary and executive committee, to deal with its program: one in the East, one in the South, one in the Central West and one in the far West. These centers will take up the immediate work of study, standardization, legislation, education and publicity.

## SOCIALISM AS A PEACE MOVEMENT

SOLON DE LEON

*[The name De Leon is one to conjure with among American radicals. The author of this interpretation of the economic and political bearings of the international working-class movement against war is son of Daniel De Leon, the long-time leader of the Socialist Labor Party of the United States.—Ed.]*

Two hundred or more Socialists—the “arch enemies of society,” the “preachers of hatred and discord”—seated in the Burgvogteihalle at Basel, Switzerland, in solemn deliberation as to how best to utilize the unity of the working people of their respective countries to prevent the Balkan firebrand from scattering seeds of war throughout Europe—such was the spectacle presented on November 24 by the Ninth International Socialist Congress, a special session called in place of the regular tri-yearly meeting which was to have been held in Vienna in September.

It is too early yet to have details of what they did at the congress, but judging from the demonstrations at Paris on the Saturday following, where 100,000 men, women and children gathered to hear the returning delegates, an energetic “war against war” must have been decided and entered upon.

Even before the Congress met, the demonstrations had begun. Early in November huge meetings were held by the Social Democrats all over Austria, one of the countries closely concerned in the embroglio, at which the orators called upon their hearers to hamper in every possible way all military movements, and to sub-

mit passively to capture if finally dragged into action.

The special congress was the result of a meeting of the International Socialist Bureau, the executive body of the international movement, at its Brussels headquarters near the end of October. At the bureau meeting thirty-three delegates were present, representing fourteen countries, and the proceedings were full of interest. Vaillant, indomitable old veteran of the Paris Commune, declared it the duty of the working class everywhere to make it clear to the governments that foreign war might mean the outbreak of domestic revolution. Adler, Social Democratic leader in the Austrian parliament, took the position—“the Balkans for the Balkan peoples, and no intervention.” Even Kautsky and Molkenbuhr, attached as all Germans are to their Fatherland, enthusiastically told of the efforts of their comrades at home to maintain peace, and pledged a continuance of those efforts. The outcome was the proposition of Vandervelde, the Belgian deputy, to call a special congress

“solely to consider the international situation, and to decide upon common action by all the national sections against war.”

The bureau agreed, and issued a manifesto which says:

“Let the proletariat stand up against the policy of war with all the power of proletarian organization, and with all the mass action at its command. Let it cry out with all its voices, let it indicate by all its actions, that it will not allow itself to be hurled into stupid and sanguinary conflicts.

“Down with war!

“Long live the International!”

It is no new thing, this activity of the Socialist movement to suppress or prevent war. A year ago, when France and Germany were ready to fly at each other's throats over Morocco, who was it helped the respective governments “count five-and-twenty” and settle the affair without plunging two nations into mourning? It was the working people of the two capitals, listening by hundreds of thousands to exchange-speakers from across the borders, and applauding to the echo their appeal to answer the call to arms by refusal to mobilize against their brothers of another language.

July, 1909, saw the King of Spain summon out his troops for an African campaign—ostensibly to avenge the death of four soldiers at Melilla, in reality to enable a society of French and Spanish mine owners to operate in that district. That same month saw the people of Barcelona and the surrounding district rise in mass, declare a general strike, and refuse to march to the war. Catalonia, of which Barcelona is the capital, is

the leading industrial province of Spain, and an old center of radical and Socialistic thought.

It is said that, during the Russian-Japanese conflict, Russian peasants had to be herded with the bayonet to the recruiting stations, and that even when placed face to face with the Japanese in Manchuria they had to be driven into battle with whips. The year of that tremendous war was also the year of the most tremendous Socialist uprising a Czar of all the Russias ever had to withstand.

In June of that same year Norway declared its independence of Sweden. The war drum was beaten in Stockholm. "Revenge" was to be taken. But the workers of both countries had something to say. Demonstrations under Socialist auspices, in which thousands participated, protested against bloodshed to settle the dispute. When the Swedish Riksdag met in extraordinary session, the King counseled peaceful measures, and the storm was allayed.

What means this incredible refusal of the workers to get themselves shot at the behest of their governments? It means that the spirit of Marx is mighty yet and growing mightier. The old International has gone down, but a new one is risen in its place. A movement millions strong throughout the world today proclaims its belief that, "Workmen of all countries unite!" is not an empty phrase, but the "*In hoc signo vinces*" of a new social era. The abolition of the profit system in its entirety is decreed; war, being one of the most gruesome manifestations of that system, must perish.

No sketch of Socialism as a peace movement would be complete without reference to the monumental figure of Gustave Hervé, the incarnation of anti-militarist propaganda in France, and indeed in Europe. A professor of history and a lawyer, he has thrice been prosecuted and once served a prison term for his advocacy of anti-patriotism, as he calls it. In 1905 he signed a poster calling on the recruits not to join the colors. Hear him as he addresses the Paris jury in his own defense:

"The nation for you, Mr. Advocate-General, is a kindly mother; for us, a step-mother, a shrew, who detests us.

"Patriotism is for you a sentiment, natural and profitable; for us, it is a fool's trap.

"We may retain for the town or village where we were born, where we grew up, where we suffered or loved, a deep affection, a natural and even instinctive feeling which is in no way akin to your love of country; but we have lost all sentiment of love for such countries of privilege and iniquity as are the great nations of today.

"For us, the world contains but two nations: that of the favored of fortune, and that of the dispossessed, whatever may be the language which they speak, whatever the land

which gave them birth. Our compatriots are not the capitalists of this country, who would massacre us if they could, as they massacred the fathers of the Commune; they are the class-conscious proletarians, the Socialists, the revolutionists of all earth, who are everywhere waging the same battle as we for the inauguration of a new society.

"In case of an order to mobilize, we would seize the moment to attempt the revolution, to place our hands on the social wealth usurped today by a minority. We would transform the dwelling-houses today belonging to individual landlords into common property. We would operate the factories, the mines, all the great enterprises, through our trade unions and our technical engineers. Our unions would conduct the great storehouses and marts as immense co-operative establishments. By a more equitable and rational organization of production, we would bring about a society in which there would be wellbeing, science and beauty for all, a society better than the present even for your sons and daughters, a Socialist mother-country which would be beautiful enough and good enough to warrant our taking arms to defend it, whether against invasion or against bourgeois intrigue.

"Rebellion sooner than war!"

Not a bad object, surely, however much one may be inclined to disagree with the means. This is the "horrid doctrine of anti-patriotism" to which both the French Socialist Party and the General Confederation of Labor, the latter half a million strong, are committed; on account of which the French government recently compelled the school teachers' union to withdraw from the confederation. Not only has the doctrine taken hold of the ranks of workers in the trades and professions, the armies also have come under its influence. The *Internationale*, which is heard with increasing frequency and power in America (witness Lawrence and the recent suffrage parade in New York), bids fair to supersede the *Marseillaise* as the Socialist anthem. It contains a stanza, prohibited in France and little known here, which runs:

"The kings, they smother us in gun-smoke,  
Oh, peace between us, war to them!  
The strike! Apply it to the armies,  
Fire in air, break ranks again!  
And if still these cannibals and tyrants  
Would of us make 'heroes' curst,  
Soon shall they learn that our own generals  
Will taste our rifle fire the first."

Such is the new conception of solidarity that is permeating the ranks of labor everywhere. Like it or not as we may, it is a factor to be reckoned with, and many a Socialist bases upon it his claim to being a member of the greatest peace movement on earth.

## EDITORIAL GRIST

### THE FAMILY—THE COMMON DENOMINATOR IN SOCIAL AND RELIGIOUS WORK

GRAHAM TAYLOR

It is strange that the family should have been so long ignored that it has become the most latent and unutilized of the primary factors and forces upon which social and religious progress depends. For, it is the most originating and persistent, the most formative and final of all the forms of our social organizations. However we date or account for its origin, the family has certainly furnished both the initiative and type of church and state. Interdependent though state, church and family have ever been, yet religion has always rooted in the home—the church has always been cradled in the household. It is the more conceivable therefore to imagine religion surviving the loss of the church than the loss of the family; to think of restoring the lost church from the surviving family, than the lost family from the surviving church.

The scriptures of the Old and New Testaments would fail to reveal God and our relations to Him and to each other were we to eliminate all the family terms from them by which our spiritual relationships are revealed. Are not these family terms the well-known quantities by which those unknown relations are revealed?

Forms of religious faith and organization have come and gone, political power and control have passed back and forth from autocracy to democracy, from republic to empire, but the family relationship has persisted, essentially unchanged, however changing the forms of marriage itself have been. As the most primitive and persistent form and force of human life, therefore, we should expect the family to reassert its social significance, primacy and supremacy. And it is so doing by becoming the common denominator of social work in the three equations which state the problems common alike to the church and the community.

1. To set a human standard for life is the first and perhaps the greatest of social problems. And the family furnishes both church and community with the test and task of setting it.

Religion sets the maximum standard in that heavenliest family type of life to which man can aspire—fatherhood like that of the heavenly Father, motherhood like the brooding mother heart of God, marriage like the mystical union between Christ and his bride, the Church, brotherhood such as only the children of God can have,

homes like the household of faith, and yet a heaven that shall be as homelike as only our "father's house" can be. The family is the common denominator of the heavenly ideal and the earthly reality whether you look to the heavenly to set the standard for the earthly, or to the earthly family to set the type by which the heavenly ideal is to be interpreted.

Equally significant is the present tendency of the community to fix a minimum standard below which it cannot afford to have family life fall. This is the incentive for limiting the hours and kinds of work for woman, so as to protect and promote her mothering the child; for relating the rate of wages to the cost of living, so as to fix a minimum wage that will keep earnings from falling below the possibility of family life; for infant welfare work, so as to reduce the death rate of little children and enhance their right to be well born and to get a fair start toward a normal life; for the protection of the child's play time, growth and schooling, so that the shop will not rob the child of its home or the home of its child. Below such a motherhood, birth-right, standard of family living, and adolescence, the community cannot afford to have human life fall. But it is the family life that measures the minimum, up from which the community thus encourages the standards of living to rise.

2. The very task of substituting other agencies to take the place of the family when it has failed or been lost, which is undertaken both by church and state, emphasizes more and more how indispensable the family form of association is recognized to be. The orphan asylum or "home," even at its best, has been found so unhomelike and such an inadequate substitute for the household that it is considered to be the better policy only to gather them there and keep them long enough to be placed out in the foster homes of families who assume their care or adopt them. The "cottage" plan of grouping and housing inmates of children's institutions not only, but those of asylums for the insane, hospitals for the sick, colonies for the epileptic, and reformatory farms are superseding the congregate plan. This recurrence to the lost or incapacitated family form of life in the effort to substitute the next best thing for it is the significant emphasis which modern scientific philanthropy is placing upon the family itself.

The very clubs and other reputable substitutes for home shelter and family circle are attractive to those deprived of, or temporarily detached from, these natural associations just in proportion as they are homelike. Even the saloons, brothels and other disreputable resorts which appeal to the man away from home, the stranger in the strange city, the starved hearts of the lonely, and others without the restraints and sup-

ports of kindred and father's house, point their appeal by simulating the appearance of homelikeness, offering bread but giving a stone, tempting with an egg which turns out to be a scorpion.

Nothing but the nearest thing to the home itself can be substituted successfully either for real family life or for those perversions which pervert virtue itself into vice, love into lust. The evangelistic use of the family, the efficacy of the home in rescue, the preoccupying, prepossessing, restorative resources of the household have not only not been exhausted, but have very seldom been applied. Neither the "mission" apart from the church, nor the church apart from the missionary spirit, is adequate to the rescue of the lost. Missions can at best be the vestibule of churches, and the vestibule fulfils its function only by leading into the dwelling. The mission is likely to be all "gate" and not "the way." Many a church is all "way" and "no gate." Only a homelike church which is a mission and a mission which is a homelike church can be the home of the soul. Little more than "foundlings" are the new born who are left on the doorstep of the mission to live. Cardinal Manning well said that such converts "are exposed to the last peril of the spiritual life—the storm in the harbor." When the prodigal comes to himself he needs to go to his father. The "lost" are "found again" only when we home them.

3. The third point at which the family becomes the common denominator in the social solution of the problems of human life is where it is necessary to supplement and assist the home in fulfilling its functions.

Here the whole cluster of agencies tributary to the family test their social efficiency by their actual success or failure in rehabilitating, encouraging, equipping and enabling the family itself to fulfil its own function. The midwife and the doctor, the hospital and the nurse, the infant welfare station and the day nursery, the school and the playground, the public library and the neighborhood center, the health and building departments and the housing reform associations, the local improvement society and the town planning commission, the municipality and the state legislature, the nation and the church are alike weighed in the balance and found wanting or fulfilling their function just in proportion as each protects and promotes the family, conserves and perfects the home.

So at last both the church and the community seem to be starting over again, where each alike began, to renew their strength by serving the families of the people. And that church or state serves itself the best that serves its families the most. That local church or local government best fulfils its function which builds family life up out of itself and not itself up out of family

life. Thus only can either of them protect or promote the perpetuity and progress of the community and religion.

## THE RINGING CALL FOR SOCIAL SERVICE

FREDERIC ALMY

Secretary Buffalo Charity Organization Society

Social workers can serve their cause well by spreading broadcast the remarkable social service report just published under direction of the Men and Religion Forward Movement.<sup>1</sup> It is a pity that this Protestant movement could not include the older Roman Catholic church and the still older Jewish church, but it is no small gain in the world that the Protestant church is at last willing to co-operate with itself. Coming from all Protestant denominations, in all quarters of America, such a report might have been expected to be conservative or timid. It is the opposite. It is a ringing call, not from social workers to the church, but from the church to the church, for social service. It goes to every little hamlet in the land with the *imprimatur* of the church, making social service an orthodox duty. Even where the churches do not budge, they must at least change front so that the next step will be our way. Copies should be sent to active church members and pastors of every faith. Every society should order some.

The report contained in Volume II of the series is by a committee of which Henry Sloane Coffin of New York is chairman, and which includes Washington Gladden, Graham Taylor, Walter Rauschenbusch, Charles R. Brown, Edward T. Devine, Frank Mason North, J. Howard Melish and more. The little volume of 180 pages includes also brief addresses by Jane Addams, John Mitchell, Dr. Gladden, Dr. Coffin, Prof. Rauschenbusch and others. It costs a dollar, and is invaluable.

When the "fifty-seven varieties" of the Protestant church pull in fifty-seven different ways at fifty-seven different times for the causes which they all have in common, it impairs both church unity and church efficiency. Moreover, when social religion supplements and re-enforces individual religion, as social medicine has supplemented individual medicine, sin and vice in the community will begin to yield as disease is yielding. Individual character often overcomes bad conditions, but so do bad conditions often overcome character, especially in children who

<sup>1</sup>Social Service: Volume II of the Message of the Men and Religion Movement. 180 pp. Price \$1 postpaid.

There are seven volumes of the Messages of the Men and Religion Movement: Congress Addresses, Social Service, Bible Study, Christian Unity, Boys' Work, Rural Church and The Church and the Press. Published by the Association Press, 124 E. 28th St., New York. \$4 the set.

are weak; and towards bad conditions the church is but just beginning to do its duty. If the churches of America come to feel that social work for the poor is God's work, and that it is part of their work to inspire and support it, then, and not until then, organized charity will cover the land as the Young Men's Christian Associations have covered it.

When social conditions become intolerable to the conscience of the nation, as was the case with slavery, some solution will have to follow. Inexorable necessities are always met. The church has the ear of the rich, who more than the poor are responsible for the causes of poverty. The rich create conditions of labor and life from which the poor often cannot escape.

The conscience of the nation is already stirring. Politics has at last come into social work, the chambers of commerce are coming in, the labor unions are in, the Young Men's Christian Associations are extending their various social interests—"Everybody's doing it, doing it, doing it." If the Protestant churches can only be made to hear the report made to them by the Men and Religion Movement, we shall see a rapid gain for the religion of Christ's second commandment: "Thou shalt love thy neighbor as thyself." This commandment "is like unto the first," and translates it into action.

A few extracts from the report will show its quality:

"At the present hour the world is blessed by widespread discontent. . . . We are to spiritualize this discontent." (P. 9.) "Social responsibility is the chief sacrament of religion in our age." (P. 15.) "The problem of housing and of food prices concerns the church. 'I was hungry and ye did not give me to eat.' When the food and fuel of the people are made artificially dear for the inordinate enrichment of powerful groups, there is no doubt where the church of Jesus Christ should stand." (P. 21.)

"The most fundamental form of social service is to put a stop to unearned profits. . . . If any one claims any part of the land as his own his rights are subject to the needs of the common welfare, and he must render to his fellows a just equivalent for the special privilege he claims. The moral title to property rests on social service." (P. 27.) "Industrial democracy is our Christian destiny, and henceforth a man's Christianity will have to be measured to some degree by the intelligence and enthusiasm with which he sets his face to meet that destiny." (P. 29.) "The workers must be granted an increasing share in the government and control of their common work." (P. 30.) "The organization of labor has come to stay." (P. 31.)

"Surely the church should legitimize play, and glorify it. . . . The ethics [of baseball]

are low. If play is vital in the lives of boys and men this important game must be saved. The church can provide, in co-operation with other agencies, the moral leadership in athletics in America." (P. 58.) Sections follow on dancing, the drama, the home, the income, health, sex-education, etc.

"The discharge of one's civic duty is a most vital part of Christian consecration." (P. 71.) "The rehabilitation of families and the complete elimination of pauperism is the goal." (P. 81.) "It is important that the churches should be led to recognize the necessity for some central organization in all the large cities corresponding to the office of the associated charities already established in many places." (P. 82.) Such an organization "can maintain a staff of experts. . . . The day of the amateur is over in all the more serious lines of effort. . . . In the difficult work of relief men and women who have studied these problems under competent guidance, and who are familiar with the best methods employed in other cities, are indispensable. In this central office records can be kept," etc. (P. 82.)"

"The one great thing which the Men and Religion Forward Movement has done for the American churches is to set blazing before them the truth and the tasks which are suggested by this phrase 'social service.' This truth they can never again deny, these tasks they can never again evade, without the consciousness of apostasy. . . . Religion will either mean a great deal more in America in the next ten years than it has ever meant before, or it will find itself, before the end of that time, in the way of meaning nothing at all." (P. 90.) "There are still millions of church members in America who need to be convinced that the kind of work to which Jesus Christ devoted a large part of his time is Christian work." (P. 94.)

"It is not the church's function, any more than it was her Lord's, to give specific directions to its members for the readjustment of civic or business life. . . . Service, not leadership, is the church's mission." (Dr. Coffin, P. 115.) "This movement has made the social gospel orthodox in the church. For a long time we had been regarded as heretics." (Prof. Rauschenbusch, P. 121.)

Prof. Rauschenbusch prophesies "that within a short time a reactionary movement is likely to take place," and that "one of the first things we have to do in the service of this movement is to stand up against that reaction when it comes." If social workers would delay or prevent such a reaction they must not only be efficient; they must match in some degree the humility, sincerity and courage shown by the leaders of the church in this movement. As Dr. Coffin says, of the church, social workers also must seek "service, not leadership."

## THE NEW YORK 54-HOUR LAW

JOSEPHINE GOLDMARK

National Consumers' League

"When I went to school, forty years ago, the last word in political economy was *laissez faire*, or letting people do as they like. The experience of fifty years has taught us that the millennium doesn't come from letting people do as they like, so legislatures have taken steps to protect those who need protection; but the judges, who were mostly educated about forty years ago, are still talking about *laissez faire*."

"This issue affects no individual woman, but the human race, and the human race has got a right to defend itself."

"What right have the judges got to read their individual conceptions into the constitution? If you go back to the original meaning of the Bill of Rights, 'liberty' meant freedom from physical restraints; not the so-called liberty of contract."

Five years ago such remarks would doubtless have been held as disrespect, contempt of court, by most New York lawyers. But a judge can scarcely be in contempt in his own court, and these observations were made, not by any lay critic of the judiciary, but by Justice Blackmar himself, sitting in the Supreme Court of New York State on November 29, 1912, to hear argument on the constitutionality of the fifty-four hour law for women.

This law, as is well-known, was enacted last winter by the New York legislature, and limits to ten hours in one day and fifty-four hours in one week the employment of women in manufacture. It is similar to the statutes of Massachusetts, Michigan, Ohio, Missouri and Utah (except that the last two states prohibit more than nine hours' labor in one day).

The New York law is thus in good company and can be considered in no sense radical. Indeed, it lags behind the other statutes which include women not only in manufacture, but in a variety of other occupations. And two states, California and Washington, are still further in advance in affording to working women by law a protection which workingmen have secured for themselves by trade agreement in many great industries—the eight hour day and forty-eight hour week.

That the New York statute is similar to laws in other states is of course in no way conclusive in the case at bar, except in so far as it bears on the reasonableness of the act. And it is precisely to emphasize the reasonableness of the act that Assistant District Attorney Egginton, who argued the case before Justice Blackmar, has filed with his brief a compilation of the laws of all the states, restricting the hours of labor of women. He has filed also a copy of Mr.

Brandeis's brief, submitted to the United States Supreme Court in the Oregon ten-hour case.

The New York law went into effect on October 1, 1912. Candy manufacturers proceeded at once to test its constitutionality. A test case was brought in Brooklyn, where William Hoelderlin was arrested on October 7 for violating the law. He was released on a writ of habeas corpus, and now seeks to have the writ sustained and the law declared invalid.

The attack upon the law centers upon two judicial decisions, holding invalid two previous labor laws. The first was rendered in 1905 by the United States Supreme Court in the bakery or *Lochner* case, overthrowing the New York statute which limited to sixty hours in one week the employment of men in bakeries. Certainly the opinion in this case (written, as Justice Blackmar vivaciously exclaimed, by "that fine type of the old school lawyer, Justice Peckham") might carry weight if it had not been subsequently overruled, so far as women are concerned, by the Supreme Court itself in the now famous case of *Muller vs. Oregon*. The latter decision settled in 1908 for all time the right of a state, under the federal constitution, to limit the hours of labor of women in order to protect the public health and welfare.

The second decision by which Mr. Talley, counsel for the candy manufacturer, seeks to bolster up his case is that of the New York Court of Appeals which, in 1907, declared invalid the law prohibiting the employment of women at night in factories. Again there is set forth in his brief the employer's concern for the "rights" of his woman employe upon whom "the doors of the factories are closed," after she has worked fifty-four hours a week, and 'who "must walk out of her place of employment . . . while her fellow workman may continue on with his work" for a quite unlimited number of hours, a privilege which the working woman, if allowed to speak for herself, usually declines with emphasis. The district attorney, in his brief, points out that the case at bar is concerned solely with the fifty-four hour law, that the prohibition of night work is not in question and hence the Williams decision does not affect the present case.

He goes further and significantly submits that the New York Court of Appeals would today uphold the entire New York law including the prohibition of night work. For the reasoning in the Williams decision "is adopted completely from that of the United States Supreme Court in *Lochner vs. New York*." Since the latter court has itself "completely repudiated the doctrine of the strict property right in labor contracts with respect to woman and her calling, and in view of the fact that throughout the country the many cases in the various states . . . have followed the doctrine of the *Muller vs. Oregon* case and up-

held the constitutionality of the acts, it is submitted that today the Court of Appeals, if the question were squarely presented to it, would reject their reasoning laid down in *People vs. Williams* and adopt that of the United States Supreme Court as expressed in *Muller vs. Oregon* and uphold this entire act with respect to adult females as valid legislation."

The candy manufacturers contend further that the law is discriminatory, because it exempts the canneries from the restriction of hours. Yet as the district attorney shows in his brief similar exemption of the canneries has, since the Oregon decision, been held constitutional by the Supreme Courts of Ohio, Michigan, California and Washington, on the ground that the legislature had the right to use its own judgment in deciding to what classes of employment the law may reasonably apply.

The candy manufacturers announced that, in order to show that the cannery were unfairly favored, they would file with their brief the report of the New York State Factory Investigating Commission, whose investigators have found in-

tolerably long hours of labor prevailing in the canneries of the state. Justice Blackmar expressed doubt whether he could properly take into account a document which was not in existence when the act in question was passed and which does not contain matters of "common knowledge" but the results of a subsequent investigation.

Justice Blackmar announced that his decision would not be rendered for several weeks, as he is about to sit in the Appellate Division. If his informal words in court count for anything, he means to decide the case on its broad merits instead of on narrow technicalities. "Do you think I need the courts to tell me that?" he exclaimed, interrupting the district attorney's plea that the overwork of women saps the vitality of the race, "every human being knows it."

Thus a technical expert shows his impatience with technicalities, as against the deeper elemental facts of life which underlie them. Such elemental facts, known like hunger and thirst to "every human being," are the real issues in the Hoelderlin case.

## THE TREND OF THINGS

### LEADERS IN THE MONTH'S MAGAZINES

**UNKNOWN HEROES OF INDUSTRY.** By Hugh C. Welr. *Technical World Magazine*. Tells of some commonplace every-day trades which carry in their processes dangers of insidious disease often more deadly than the ordinary industrial accident. The article tells the dangers, the pictures point out some of the cures.

**INSURANCE FOR WORKINGMEN.** By Burton K. Hendrick. *McClure's*. In healthful contrast with the pitiful human stories that were written under the old liability system, Mr. Hendrick tells just what the compensation laws already passed have done to ease physical pain by providing peace of mind.

**BURNS OF THE MOUNTAINS.** By Emerson Hough. *American*. The story of a Cumberland mountaineer, a man of the breed of Lincoln, who is trying to free the native American people of the Southern Appalachians from the "white bondage of arrested civilization." Powerful in body and powerful in mind, they lack schools, roads and money.

**OUR PRISON SWEATSHOPS.** By Julian Leavitt. *Pearson's*. The secretary of the committee on prison labor of the National Consumers' League again takes up in this series the subject of prison labor and its effect on prison life to which he first gave publicity in the *American*. In this first article he shows contract prison labor as a traffic in men for gain, hardly less shameful than the white slave traffic in girls.

**THE INASMUCH MISSION.** By Blair Jaekel. *World's Work*. Four "buns of the uttermost, guttermost type" drifted into the same mission, where gradually, to use their own words, the saving power of Christ worked upon them and they came together, resolved to carry this power to others in like case. The result was the Inasmuch Mission, the story of whose two years' work is told by a friendly observer.

**TUBAL CAIN.** By Walter M. Urban. *Atlantic*. An attempt to estimate the moral and social philosophy expressed in the art and literature of the new labor movement, in its bearings on the society of the future.

**MY LITTLE SISTER.** By Elizabeth Robins. *McClure's*. The first installment of what promises to be a disturbing piece of fiction, which essays to show how fashionable houses of prostitution are recruited.

**GOOD WILL TO WOMEN.** By Ida M. Tarbell. *American*. An account of some of the human material Dr. Davis has to work with in Bedford Reformatory, and how she works with it.

"WE heard of the mountaineers in the Civil War," says Emerson Hough writing in the *American* on the work of the Cumberland leader, J. A. Burns, "when a hundred and twenty thousand of them fought for one flag. Then we forgot them." He continues:

For many decades we have had no news regarding them, save garbled news about their feuds and moonshining. Moonshiners? Yes, but Prohibitionists. Illiterate? Yes, yet wise in the loyalty which has held them to the flag and to the government, a loyalty which by some strange intuition they have retained through a century of isolation. Slave-owners? Never, but workers themselves. Feudists? Yes, but carrying on feuds as a religion. In short, a half million splendid Spartans living in a rough land two hundred by six hundred miles in extent, and held in the worst of bondage for more than a century; while meantime our civilization, first simple and strong, now mad and sordid, has roared on across the land.

Mr. Hough retells in Burns's own words the story of the meeting in an old mill-building when this Cumberland mountaineer called his treaty meeting for the gathering of the clans in 1899. They were twenty-odd men on a side, about equally divided:

"It was a mighty quiet meeting. They sat, all armed, squatted on opposite sides of the great room in the old mill, and Burns,

feudist, mountaineer, schoolteacher, preacher, got up now and addressed them.

"He said to them that they were all rearing their sons for the slaughter, that they were living as heathen, that it was all wrong, and that there was only one way to right the wrong. He told them the only thing to do was to educate the boys, and the only way to do that was to bring in a college for their education. He said that he had no money, but was going to start a college, and asked if they cared to help him. That was in 1899, two years after the killing of Tom Baker. I have visited Tom Baker's home, have eaten with Tom Baker's daughter, now married and a Hensley by name. Crane Creek Valley, late bloody, is now quiet again. They say that feudism and moonshining is done in Clay County; and they date back to 1899 and the meeting in the mill.

"We keep treaty pens. We make paintings of historical events. There is no pen preserved by which these feudists made their marks on this charter application. There is no painting of that scene in the old mill on the bank of the Kentucky River. Fifty men, silent, armed, fearless, ignorant, illiterate men, fifty yearning, ambitious, anguished men, held in the thrall of a false idea, yet ambitious for their sons—fifty men ranged half and half, opposite each other, silent, alert, watching one another, and listening to the first prophet of the Cumberland Highlands—ah, that was a picture! 'I didn't know what they were going to do,' said Burns, 'but I was right glad when Lee Combs got up, and when Dan Burns got up too, and they met in front of me. They did not draw, but they shook hands. Then I knew that Oneida College was going to be a success.'

"So they signed their charter and went home; and the Baker-Howard feud has halted since then, and feudism and moonshining have passed in Clay County."

\* \* \*

**THAT** is a great saying of Arthur Young, the cartoonist of labor conditions.

"Not art for art's sake," says he, "but art for man's sake."—*Coming Nation*.

\* \* \*

**IN** this month's installment of the series on The Battle Line of Labor (*World's Work*), Samuel P. Orth quotes a picturesque characterization of the strike-breaker from the head of a detective agency:

"They are a wandering class. Some have a past, some are ex-union men who went to work contrary to instructions and were ostracised, moved away from their old home, and are doing this as a sort of way of getting even with the unions. Most of them love adventure and, when the danger is over, get restive. I have had them come to me, after things got quieted down on a job, and ask, 'Say boss, ain't there some place

where there is something doing, it's too church-like here.'

"They get their fun out of the danger, are used to guns and clubs, and can hit hard when necessary. They have a sense of loyalty that is remarkable. They obey orders like soldiers, and you can't tell me they do this just for the money there is in it. I have been followed many times, have had five men attack me in the dark, have had a price on my head, have had my men followed by four or five to each man. I have had men clubbed, stabbed, and shot; and their orders are to return the compliment. I have sent men out of besieged works with orders to do business, if they were attacked, and I have myself used the gun. It is war and excitement, and when a bunch of infuriated men are after you, you use the weapon and don't shed tears."

A circular advertising the services of these stalwarts reads:

"Secret men attend all meetings and report proceedings. The service possesses the equipment, such as Winchester rifles, police clubs, cots, blankets, etc., to handle any sized trouble."

\* \* \*

**THIS** human interest story of the operations of the Washington Insurance Law is told by Burton K. Hendrick in *McClure's*:

One of the most contented and useful citizens of the state of Washington is Edward Sweum, for many years an industrious worker in the lumber-camps. As Sweum sits day after day in his pretty mountain shack, however, there is little about his outward appearance that suggests any adequate grounds for contentment or self-satisfaction. In place of arms, this once hardy lumberman has merely two useless stumps; one is cut off at the shoulder and the other at the wrist. Sweum can not dress himself, feed himself, hold a book or a newspaper; unless, as he himself optimistically says, "I could yust find one of dem artificial hands, so I could put on my clothes and eat my foodt," he will remain a helpless cripple for life.

And yet, hard as seem his circumstances, Sweum has certain marked compensations. He owns, free of mortgage, his little home and its surrounding acres. Instead of being a charge upon his relatives or upon public charity, Sweum is still the financial mainstay of his family. His calamity has not driven his wife to the wash-tubs, and his children, comfortably clothed and adequately fed, are still regular attendants at the public schools.

In Sweum the state of Washington gives the nation an illustration of a new sense of governmental responsibility. That a man can have both arms cut off, and his family still maintain its dignity and integrity—herein the state has made a striking contri-

bution to the cause of advancing civilization. Washington, in a word, has a new law which compels employers of labor to make financial provision for injured workmen. Edward Sweum was the first to go upon this pension list for total disability.

\* \* \*

THE *World's Work* characterizes as the "beginnings of a revolution" the system of agricultural and domestic training quietly set into operation by Wisconsin, and already being copied by nine other states. "The Wisconsin schools," says the *World's Work*, "are coeducational, with courses of two years; the entrance requirement is work equal to the eighth grade of the public schools; the state gives \$4,000 to each every year and a county tax yields the rest of the money. The faculty of the Dunn County school, for example, consists of the principal, who teaches field agriculture and horticulture, a teacher of agricultural engineering, a teacher of animal and dairy husbandry, a teacher of domestic science, and a teacher of history, economics, and English—three men and two women. Last year there were 84 students. In another school there were 153. The buildings of these schools range in value from \$20,000 to \$60,000; the cost of maintenance, from \$6,000 to \$14,000."

\* \* \*

JULIAN LEAVITT ends his first prison labor article in *Pearson's* with a practical suggestion aimed to stimulate local prison reform organizations. Says he:

The contract system exists to-day, either openly or in disguise, in the twenty-three states named in the following list.

If you live in one of these states you can, individually, start a movement in the right direction by writing to the secretary of your local prison reform organization, asking him

1. Whether he knows what is going on in the prisons of your state?
2. If he does know, is he giving the facts proper publicity?
3. If he does not know, is he taking any steps to find out?

Missouri	Tennessee
Nebraska	Vermont
New Hampshire	Virginia
New Jersey	West Virginia
Rhode Island	Wisconsin
South Carolina	Iowa
Alabama	Kentucky
Connecticut	Maine
Delaware	Maryland
Florida	Michigan
Illinois	Minnesota
Indiana

"WHY is Ann B. here?" asks Miss Tarbell, writing on the Bedford Reformatory in the *American Magazine*. Ann's story is one of a dozen which will give those who

Alice Beach-Winter

Courtesy of The Masses

"Quit cher bellerin'! Look what I gotta carry! Look what we all gotta carry!"

read them a glimpse of the human problems to be studied in the laboratory for social hygiene at Bedford described in THE SURVEY for December 7. She has the look of innocence, and is lovely as women rarely are—oval-faced, delicate and gentle, red-brown eyes that are clear and direct, hair that matches and coils in knots almost too heavy for her little head to carry. Why is she here? Certainly not for shameful living! Here is her story:

Her parents, decent and hard-working at the start, quarreled. At twelve they put her into an institution where for a year they visited her. Then they separated, finally. Ann is now nineteen, and she has never seen them since. The institution doubtless did the best it knew for her. It fed her, clothed her, taught her fragments of things, and she worked it out—washing dishes, scrubbing floors, and making beds. At sixteen they "found her a place." But what kind of a place could she fill? No decent one, unless there was a woman at its head who saw in her an opportunity and an obligation and was willing to give of her time to train her and save her. She was turned from kitchen after kitchen as "ignorant," though she did her best.

She had as hazy ideas about morals as about housework—the catechism doesn't mean much save to those who have tasted life—and when given warning for the third

or fourth time, a janitor offered her a home with him; she took it gladly. He tired of her soon. *But he had taught her how to earn her living, something which neither Christian institutions nor Christian housewife had done.* She applied the teaching quite naturally, and on the whole happily. She was no longer met with scowls and cross words, and it was not so dull as the asylum and the solitary unfriendly kitchen.

\* \* \*

**T**HE *Literary Digest* translates excerpts from an article by Leonie Sienicka in *La Revue*, on the songs of Siberian prisoners or vagabonds escaped from prison. Their accompaniment is the comb or the clanking of chains, as musical instruments are forbidden in prison. Mme. Sienicka thus describes a concert given by a Russian composer who had collected many of these Siberian melodies and songs:

The "March of Irons" will linger in my memory forever. Imagine a chorus chanted with closed lips. Sounds thus produced resemble groans. . . . As accompaniment the sharp shrilling of combs, like the wail of the north wind in a bank of reeds. And to mark the rhythm the sinister clauking of the chains shaken by the arms they hold in gyves.

Unforgettable orchestra! A young girl of sixteen fainted during the execution of this march. Within the hall every face was pale, every lip quivering with emotion.

Here is one of the songs, a funeral dirge for an escaped prisoner, a vagabond on the steppes:

To-day, when the dawn broke  
I buried my pal.  
Not far from the bend of the road  
I put him in the cold grave.

No funeral bells were heard,  
No songs for the dead . . .  
But our mother, the frozen earth, took  
him forever  
Received him without priest and with-  
out candles.

I have kindled upon his tomb  
The trunk of a young birch-tree.  
And I have wished for my vagabond pal  
That he may rest in peace.

**LYMAN ABBOTT**, looking back over sixty years' citizenship, thus formulates the message of the Nineteenth Century to the Twentieth in the *Outlook*: Says the Nineteenth Century:

We have made a political union; you have to make a vital union out of a heterogeneous population.

We have liberated the slaves; you have to teach this Nation how two races, preserving their racial purity, can live happily, hopefully, and prosperously together on a basis of mutual self-respect.

We have organized industry on a basis of selfishness; you are to pervade it with the spirit of love and service.

We have banished famine and are banish-

ing pestilence; you have to banish poverty and war.

We have opened wide the doors of the school-room and given intellectual instruction to a great ignorant population; you have to learn how to supplement that intellectual education with moral training.

We have taken from our fathers religious liberty, perfected and completed it, and handed it over to you; it is for you to bring together the several members of conflicting churches and unite them in a common effort for what Mulford has well called the "Republic of God."

\* \* \*

**S**ING a song of farmers,  
Up at early morn,  
With four-and-twenty chores to do  
Before the breakfast horn.  
When the breakfast's over  
There's little to be done,  
Except to plow the fodder  
And let the harrows run,  
And mow the sheep and prune the beets  
And curry up the swine,  
And shear the hens and dig the hay  
And shoe the gentle kine,  
And saw the wheat and rake the rye  
And wash and dress the land,  
And things like that which city folks  
Can never understand.

—Life.

**W**ITH respect to the rise in general prices, Prof. Irving Fisher holds that "the end is not yet in sight." The index numbers of Bradstreet and the *London Economist* show that the price level—an average of several commodities in common use—of the first eight months of 1912 was 5 per cent in America and 6 per cent in England above the year before and the highest point yet reached in this generation.

Donahy in the Cleveland Plain Dealer  
WHEN MOTHER GOES TO MARKET

## PERSONALS

**NO MINISTER**, I believe, was ever a truer teacher and exemplar of a socially applied Christianity than Robert Collyer, who died on November 30 last, rich in honors and in years. His theology was all summed up in the simple phrase "the Fatherhood of God"; his religion was never interpreted in any other terms than the Brotherhood of Man; his life was one long service of the needs of humankind.

His lowly birth and early experiences in the mill and at the forge were the guarantee of his uncompromising democracy, and the source of his life-long interest in, and service of, the so-called lower classes of our two greatest cities, Chicago and New York. His father and mother were both orphan apprentices in the factories of Fewston in Yorkshire, and in the case of neither parent could he trace his descent back more than a single generation. At eight years of age, owing to the necessities of the family, he was himself put to work in the factories, where he remained for six years. "The hours," he tells us in his *Memories*, "were thirteen a day five days in the week, and eleven on the Saturday—rising at six in the morning and out at eight in the evening, with an hour for dinner. And if we got a chance to sit down for a few moments when the overlooker was not round with his leather strap to lay on our small shoulders, we were in luck." Speaking to me once about living his life over again, he said that he would gladly do it all, except these six dreadful years, for which even added blessings could not compensate.

At fourteen he was apprenticed to a blacksmith, and from this time until his entrance into the ministry, in 1859, he labored at the forge. At intervals when the smithy was idle, he made hay in the fields, carried a hod for bricklayers, dug wells, worked on the turnpike, and broke stones. Thus did he know the joys and sorrows of the laboring man if ever a clergyman did, and was uniquely fitted to serve their needs and voice their aspirations.

Beyond his actual experiences, however, was a temperamental attitude toward religion which gave him a supreme interest in its social aspects. "I never cared for what we call dogma," he writes in his autobiography; "I preached about the life that now is, because this was what always lay near my heart." It is not surprising, therefore, to discover that he was an ardent Abolitionist in the early days of ill-repute; that he began his professional work, not as a preacher, but as a minister-at-large to the poor; that he was released from his parochial duties during the civil war to go to the front as a nurse and agent of the sanitary commission in the hospitals and on the battlefields; that he was the official representative of the state, commissioned by the governor, in times of devouring floods in southern Illinois; that he was one of the commanding figures in Chicago in the terrible days following the great fire; that throughout his life he was

1823—ROBERT COLLYER—1912

an untiring servant of the needs of men, whatever their class or condition or church. Religion means nothing, he always declared, unless it be made practically useful in the work of individual and social betterment.

The social question, as we know it today in all its complex ramifications, had scarcely appeared at the time he was laying by the active labors of his ministry. Our modern scientific methods, our elaborate machinery of investigation and accounting and relief, and our radical movements for the extension of governmental functions to social needs, would have bewildered him, had he known or studied them. The social question of his period of activity had hardly reached beyond the question of the helping hand and consecrated heart of the individual. But as he was faithful to the social work of his day, as defined and understood, so he would have been faithful to the social work of this day, had this day been his. As it was, even in his extreme old age, every cry of justice which reached his ears awoke a response in his heart. Every appeal for human betterment had his sympathy. He never was happier than when I invited tuberculosis experts, child labor reformers, peace advocates, etc., into our pulpit. A church aloof from the world of men was to him an abomination—a church in and for the world of men, at once an ideal and a reality.

JOHN HAYNES HOIMES.

[Church of the Messiah, New York.]

THE Frank Wayland Higgins Memorial Hospital was formally presented to the city of Olean, N. Y., recently by Mrs. Frank Sullivan Smith of Angelica. Mrs. Smith is a sister of the late Governor Higgins of New York. The new building is a general hospital of forty beds. In its planning careful study was made of the latest methods of hospital construction. It filled up immediately, and the operating room has been engaged nearly every day.

At the dedicatory exercises Homer Folks of the State Charities Aid Association said: "A hospital prevents suffering, conserves strength and vitality, relieves bitter poverty, adds to the sum-total of our knowledge of the causes of illness, and thus aids in the prevention of the innumerable evils due to disease. In doing these things through the uncounted years of the future, this hospital will accurately and worthily express the great motives and purposes of Governor Higgins' life."

\* \* \*

THE Women's Board of Home Missions of the Presbyterian Church voted recently to send to the schools under its jurisdiction, a special lecturer on eugenics and sex hygiene. Irene Earll, lecturer on the staff of the Society of Sanitary and Moral Prophylaxis, was chosen and is now in the field, with headquarters at Asheville, N. C.

\* \* \*

HAMILTON HOLT, editor of the *Independent*, is one of the three judges under the protocol of the cloak, suit and skirt trade in New York. His confreres are lawyers, and they form a permanent tribunal ready to make final decisions on issues which are raised by either employer or employe and which the two parties to the protocol are not able to settle between themselves.

To illustrate the sort of decisions which come up and also the niceties of the position of a layman who must act as the deciding voice between lawyers of such stands as his fellow members, Louis D. Brandeis of Boston and Morris Hillquit of New York, Mr. Holt tells how they settled a moot question as to the burden of proof.

A man who is discharged by his employer, under the protocol, has the right to appeal. Such a case failing of adjustment reached the three judges. The point was whether the burden should rest on the employe to prove that he ought in all fairness to be reinstated; or on the employer to prove that he was justified in discharging the man. Mr. Holt talked it over with Mr. Hillquit in New York, and they were of one mind. Then a letter came from Boston in which Mr. Brandeis took the opposite point of view. The lay member found himself impressed with Mr. Brandeis's logic, and he went backward and forward, something of a football between the two men of law. To help clear his mind before casting the decisive vote, he called on his father, Judge Holt of the Federal Court, who, he found, agreed with Mr. Hillquit; but Dean Kirchwey of the Columbia Law School, to whom he also appealed, lined up with Mr. Brandeis. Then Mr. Holt be-

thought him of the fellow members of his college class—such of them as had gone into the legal fraternity—and wrote them all letters. The answers came back about evenly divided. Here seemed to be a cleavage that was about to rend the legal profession as well as the garment industry.

Finally Mr. Brandeis came on from Boston, to meet with his fellow members at the City Club, as the issue seemed an important one. Mr. Holt was perhaps five minutes late in getting there, and was fairly staggered when he found that his two fellow members had come to an entire agreement between themselves before he arrived. Their solution was simple. They had decided that it was up to the workman to turn in all the proof he could muster to go to show that he should be reinstated; and, on the other hand, that it was up to the employer to turn in all the proof he could muster to go to show that the discharge should hold. And then the arbitral court, with the facts from both sides completely before them, could pass on the case.

So the protocol in this garment trade still stands, however much the legal profession may be racked in its own mind on an abstract question of law.

\* \* \*

KATE BARNARD, state commissioner of charities of Oklahoma, has been in New York recently, and Dr. Robert E. Ely of the League for Political Education gave a luncheon which proved to be a remarkable mustering of the nations—a Finnish exile, a Japanese professor, a Russian revolutionist—so the people ran around the table. This circumstance prompted Martha Berry of Georgia to tell an interesting experience she had had in a New York settlement. Governor Wilson has said that the difference between a stump and a Georgia Cracker is that the stump sometimes moves. Miss Berry described to a room full of East Side children just what new and wonderful things a chance at schooling means to the native-born youngsters of the stagnant country districts of the South. She told it in story fashion, and while the head of the Rome School is an old hand at making raids on fashionable gatherings of New York people of means, she made no financial appeal to this little audience. She noticed, however, some of the children going out and in, and at the close of the evening a much soiled and bespotted handkerchief was passed up to the speaker. In it were pennies—the pocket pieces of all nations—German, Russian, Italian, Austrian and American, a gift quite out of their hearts, deep out of their pockets, from the children of the world to the children of America.

\* \* \*

A "HERO of peace" was recently described by Alfred C. Reed in the *Outlook*. This was Dr. Thomas Brown McClintic of the United States Public Health Service, who during the last year eradicated the tick, the cause of a virulent fever much like typhoid, from an infected area in Montana, but himself fell victim to the disease. "As it went, it struck down the man who had conquered it."

## COMMUNICATIONS

### ERADICATING THE SOCIAL EVIL

TO THE EDITOR:

I am interested in your warfare against vice and would like to submit in the following form the reasons for my belief in the eradication of the social evil:

American  
Effective  
Reasonable  
Advantageous  
Desirable  
Important  
Christian  
Timely  
Imperative  
Obligatory  
Necessary!

PAUL E. DUBOIS.

[Union Theological Seminary.]  
New York,

### THE NEW YORK COURT OF APPEALS

TO THE EDITOR:

Verily, yea verily, Mr. Devine is "agin" the New York Court of Appeals. I awaited, with interested expectation, the encomiums which I thought he would surely shower upon its enlightened decision in the Fitzwater case. But, 'twas a case of budding hope crushed to earth again. He still laments. His quarrel with the justices now is that they most naughtily refuse to "retrace their own steps in contrition and remorse," that forsooth they still decline to hold an employer, who is free from negligence and in no way at fault, liable for all injuries received by his employees. If this is to be done—I quite agree with Mr. Devine that it should be—the courts should not do it. The people, and the people alone, by the legal and orderly process of state constitutional amendment, should inaugurate such a fundamental proposition. The situation in the Knisely and the Fitzwater decisions, on the one hand, and the situation in the Ives case, on the other, bear no more resemblance or analogy, from the legal and juridical viewpoints than crickets do to doughnuts.

I. MAURICE WORMSER.

[University of Illinois.]

[Our correspondent is mistaken. I am not "agin" any court; but I am unalterably and indignantly against certain decisions which that court has made. I rejoice in the conviction, now confirmed by positive evidence, that those decisions are not regarded in other jurisdictions as good law, and that one of them at least is no longer good law here. It is the Court of Appeals itself, and not this commentator, that connected the Ives case with the Knisely and Fitzwater cases. Justice Cullen expressed the opinion that the present attempt to divorce compensation from negligence is due in part to the fact that the courts have refused damages even when there was negligence. Mr. Wormser, I am glad

to see, apparently agrees with me that this is a mistake. I agree with him that legally and juridically—I will add sociologically, morally and logically—the two questions have nothing to do with each other. The step in advance taken by the Court of Appeals in the Fitzwater case is only a baby step but it is in the right direction; and my intention was to express, as to this decision, all of that ardent, pent-up enthusiasm, which is at any moment equally ready to burst forth whenever the court decides to reverse its position in the case of the Gerry Society, in the Grimmer case, in the Jacobs case, or in the Ives case.—E. T. D.]

### OF VERDICTS

TO THE EDITOR:

I hardly know in what terms to refer to Everett P. Wheeler's letter in *THE SURVEY* for November 30. I am no lawyer, but I have been instructed that it is a principle in law to assume innocence until guilt is proven. That it is merely fair to suspend judgment, and so I must confess that Mr. Wheeler's letter shocked my sense of justice. He says he has served on law reform committees "for a good many years in promoting the work of reform in the administration of criminal justice." How, then, can he in his next sentence use these words: "I have no doubt that Giovannitti finds it very uncomfortable to be in jail. But he ought to have thought of that before he committed the crime of which he is charged. But that is the question to be determined by the jury." Exactly so, and it just happens that the jury brought in a verdict contrary to Mr. Wheeler's. The jury agreed with Miss Sumner. Probably Giovannitti was as little uncomfortable in jail as though he had reflected before going there upon the possible consequences of being charged with a crime he did not commit. Certainly before going to jail his mind was preoccupied with the wrongs and sufferings of others rather than with such speculations as Mr. Wheeler suggests.

CAROLINE B. LA MONTE.

Bound Brook, N. J.

### A SETTLEMENT IN TURKEY

Those who read Emily Ray Gregory's appeal for Social work in Backward Countries' may be interested to know that a young Armenian woman, who graduated a "Heart Christian" from the American College for Girls, Constantinople, is a pioneer in settlement work in Turkey. After her graduation she started a school which proved very successful. Hearing of a village in Central Asia Minor, where the people had had no instruction to uplift them, and were living degraded lives, she asked that a missionary be sent them. When no one could be found to go she decided to give up her school and go herself to live and work in Chalgara, a village so inaccessible that the last day's journey had to be made on donkey back. She sent on word she was coming and asked that a room be cleaned for her. An effort in this direction was made, and although a high ideal was not reached the attempt was encouraging.

<sup>1</sup>See *THE SURVEY* for September 14, 1912, p. 745.

Here Miss K. lived for a few years without any helper, giving object lessons of cleanliness and friendly neighborliness.

"You cannot teach Christianity," she said, "until you first teach self-respect."

In a letter received this year she writes:

"Indeed there are some changes in my neighborhood, and among my friends and girls. They try to be clean so I feel myself rewarded. I did a great deal of washing and scrubbing floors my first years, and it was like an object lesson to the women, and some have clean houses, clothes, hands and face now.

"My villagers will not be extremely poor if they have some kind of home industry. The women know how to weave some coarse cloth which they use for their households. I got some cotton and tried to make them weave for me. At first they had many excuses and did not like to work. But after some months several came and asked for work. I hope it will spread in the village and many more will work and earn some money. I had an instrument brought with me which set up the warp for the loom which is a great help, making weaving easy and successful.

"There are sixty girls in my morning school. my old girls can read and write easy things, know verses from the Bible and can sing hymns."

This is certainly practical "social work in a backward country." L.

#### A NEWARK MENDICANCY SQUAD

TO THE EDITOR:

Would it be possible for me to get a half-dozen more copies of THE SURVEY of October 26? You will be interested to know that our police commissioners have appointed a mendicancy squad (two plain-clothes men), and that the article describing the Baltimore mendicancy plan crystallized the matter. I would like to put it into the hands of all the police commissioners, judges, etc., concerned. The two men are intelligent and capable, and the plan promises to work out satisfactorily.

A. W. MACDOUGALL.

[Secretary Bureau of Associated Charities.]  
Newark, N. J.

#### COUNTY CONFERENCE OF CHARITIES AND CORRECTION

TO THE EDITOR:

Fitly supplementing the educational work attempted by the national and state conferences of charities and correction, the times are favorable for extending this work to the local community life of the people by the organization of county conferences of charities, correction and health.

The county is the unit of state government and in the larger cities which conduct business under independent forms of charter government, the union of research and relief in manner to make all reports county reports is a simple matter of detail.

In Minnesota the county commissioners in sparing numbers share in the deliberations of the state conference. The effort to organize county conferences in the larger counties has

begun, and will be pressed to a successful development.

The state board of health does not enjoy the merging of health interests under the titles of charities and corrections, and hence the addition of the word "health" to the name of the county conference. Township organizations to gather information, and distribute literature giving advice to every home concerning the methods for battling and baffling disease can be fostered by the parent county conference.

Delegates from the county conferences carrying their reports and problems to the state conferences, and delegates from the state conferences carrying well-digested summaries of these reports and problems to the national conference, cannot fail to mark a beginning of the co-ordination and co-operation, vital to progress.

The national conference will readily adapt its plans to needs thus developed, and will be stronger in public esteem because of the encouragement of a definite plan of social welfare work which reaches to the homes of the people through the channels established by themselves. Let us begin the organization of county conferences of charities, corrections and health.

C. E. FAULKNER.

[Superintendent Washburn Memorial Orphan Asylum.]  
Minneapolis, Minn.

#### PRIVATE PROPERTY IN LAND

TO THE EDITOR:

In your issue of September 14 is a letter on Abolition of Poverty from John K. Lewis, Santa Barbara, Cal., which contained the only reference to the "fundamental injustice of property in land" that I have seen in your paper.

I read THE SURVEY every week; it is doing splendid work. But what is the underlying cause of most of the problems with which THE SURVEY deals? Why do we need minimum wage boards, laws to regulate the hours and conditions of working women and children; why, indeed, need any child in the land work, or any married woman outside of her own home? Why is the cost of living high and getting higher until even people who do not belong to the laboring class find—like A. S. W. in your issue of October 26—that living on a salary has become a problem? In the final analysis, private property in land is the cause of it all, or nearly all. Why do vast armies of working people have to live on the terms of the steel magnates, the coal barons, the oil kings and others like them, but because these have a "corner" on the iron, the coal, the oil, etc., provided by nature? In other words, because, by being primarily great land owners, they possess the things that the earth holds for all, and that all must use to live.

We cannot abolish poverty until land values are properly taxed, so that no one can afford to hold more land than he can use, and we must also remit all other taxes so that labor shall receive the full value of all that labor creates. Until land and labor are thus freed we must expect the industrial problems of today to grow more complex and the suffering they cause more widespread.

Troy, N. Y.

ELLEN A. FREEMAN.

## JOTTINGS

### COUNTY INDUSTRIAL TRAINING SCHOOLS

County industrial training schools for boys was one of the suggestions made at the recent South Carolina Conference of Charities and Corrections. In making it Professor Wallace of Spartanburg, who has seen the evil effects of premature labor by untrained children in his own state, urged industrial training for all children. Deaconess Sands who, as welfare worker in the mill village of Graniteville, has seen at first hand the reaction of labor conditions on the workers, urged a state industrial school for white girls. A more direct interest by the state in educating its Negroes was called for by N. W. Brooker, president of the South Carolina Prison Association, who declared that homicide and other crimes are not decreasing and that only through education can they be made to do so.

### WORKHOUSE FOR DELINQUENT HUSBANDS

On October 1, a law went into effect in Prussia, which allows the courts to send a man to the workhouse on the complaint of poor relief officials, if he fails to support his family properly. The man's surplus earnings from work in the workhouse are used for the maintenance of his family.

### A GROWING LIBRARY

While the average public library throughout the country is rapidly increasing the number of its books on civic and social subjects, the more specialized sociological libraries are multiplying and growing also. A recent report of the library conducted by the New York School of Philanthropy and the Russell Sage Foundation declares that the shelves now contain 10,000 volumes and 15,000 pamphlets. Special classes of books in which the library is particularly strong are—city problems, charities and correction, housing, civic welfare and recreating, health and disease, vocational training, vagrancy, church socialization, labor conditions, with special collections on child labor and women in industry, social progress and reform. Seven bibliographical bulletins were prepared and printed during the year as follows: farm colonies for vagrants and convicts; vocational guidance; selected list of books on social subjects published in 1911; juvenile delinquency—causes and treatment; social aspects of town planning; improved housing; feeble-minded children—education and training.

### CENSORSHIP FOR FILMS

Saxony and Bavaria have established bureaus of censorship for moving-picture films. In Berlin also strict censorship exists and the number of cinematographs decreases every month on this account and on account of rules for fire protection, exclusion of children during evening hours and prohibition of smoking.

### CHILDHOOD'S BILL OF RIGHTS

The "Bill of Rights for Childhood," written by V. H. Lockwood, has begun going the rounds in Indiana lately. It has been adopted as a slogan by the state federation of women's clubs and three sermons were preached on it during the recent conference of charities and correction. Every child has the inalienable right, it declares,

To be born right.

To be loved.

To have his individuality respected.

To be trained wisely in body, mind and spirit.

To be protected from evil persons and influences.

To have a fair chance in life.

### MORE HOUSES AND TWO WAYS TO GET THEM

"What we need is more houses, not the regulation of existing houses," said Frederick C. Howe, director of the People's Institute, New York, recently at the Massachusetts Conference of Charities and Correction. To his mind "more houses" can be secured in only two ways—state or municipal building or taxation of land values. For twenty-five years," Mr. Howe went on, "we have treated the symptoms of the housing problem rather than the disease itself. Our efforts have been directed to sanitary regulation, to the control of private initiative. As a consequence, we have increased building cost; that in turn has increased rent. Increased rent in turn has meant greater congestion. The city itself must enter the competition as a housebuilder or must tax land values so that men cannot sit idly on vacant lands which should be used for the proper housing of the people. For a score of years, Germany and England vainly attempted to solve the problem by regulation just as we have done. But rents continued to increase. The proportion of income paid for rent continued to rise. Finally, in Germany and in England, both about the same time, old methods were changed, and the cities, boldly, courageously and intelligently, proceeded to build houses themselves or to encourage co-operative building. Germany supplemented this policy by taxing unimproved lands at twice the rate of improved lands, as well as by the unearned increment tax, first adopted by Frankfurt in 1904 and now made an imperial tax covering all the towns and cities in the empire. The land taxes in the English budget of 1909 have led to the breaking up of estates and the opening up of the land to use, showing the effect of land value taxation on speculation.

Mr. Howe's statements were of particular interest to a Massachusetts audience because the state for several years has been committed to the policy of state aid for the construction of houses for workingmen.

### SUBJECTS FOR PRIZE ESSAYS

The London School of Economics and Political Science, Clare Market, Kingsway, London, England, will award a social research prize of £100 for the best monograph on an assigned subject written during the session 1912-1913. The following interesting choice of subjects is offered:

"1. An analysis, quantitative and qualitative, of the annual consumption of wealth in the United Kingdom, showing in what the total product of commodities and services actually consists, and how and by whom it is 'consumed,' and as far as concerns any parts of it, with what unsatisfactory or positively deleterious results.

"2. The actual working and ascertained results of the Old Age Pensions Act; with suggestions for its improvement.

"3. A survey of any village or small town in Great Britain accompanied by an estimate of its characteristic advantages and its limitations, with suggestions for improvements (a) from within, (b) from without.

"4. A new factory bill, which should, without adopting any new principle, by appropriate technical clauses in parliamentary form, extend and make applicable to every section of employed persons in the United Kingdom all the various protective provisions now applicable only to particular sections in the existing Factory, Workshops, Truck, Shop Hours, Railway and Mines Regulation, Trade Boards, Merchant Shipping, and similar acts; with a view to securing by law to every worker such a national minimum of education, sanitation and safety, leisure and rest, and subsistence as is already prescribed by law for some workers.

"5. Whether, and if so in what manner and to what extent, the best economic use of land in Great Britain, urban or rural, is prevented by (a) considerations of sport or pleasure, (b) restrictive covenants in leases or other conditions of tenancy, (c) life interests, trusts and other forms of limited ownership; and (d) the system of assessment and rating, and other methods of taxation.

"6. Whether, and if so under what circumstances and to what extent, the agricultural industry as it is or as it might be carried on in Great Britain could afford higher wages to those engaged in it."

#### JEWISH FARMERS IN CONVENTION

The fourth annual convention of the Federation of Jewish Farmers of America was held in New York, November 17 to 19, in the Educational Alliance Building. At the opening session Rev. Nathanson read the memorial service in memory of Isidor Straus, Ida Straus, Morris Loeb, David Blaustein, and Arthur Reichow.

Discussion of the work of the purchasing bureau of the federation which buys fertilizers, seeds, agricultural implements, etc., at wholesale, and sells them to the farmers at lower prices than they could otherwise be obtained brought out its value. The bureau also acts as a clearing house for new and better methods of agriculture.

Co-operative credit unions, long in existence in European countries, a national movement for which is now being pushed in this country, is another of the federation's activities. Started with the help of the Jewish Agricultural and Industrial Aid Society, eight of these Credit Unions have now been established, four in New York and four in Connecticut. Small loans at short notice and upon easy terms are supplied. Religious in-

struction for the children of Jewish farmers and various social activities are other phases of the work of the federation.

Resolutions were adopted by the convention to petition Congress to consider the subject of agricultural banking, particularly the establishment of co-operative credit unions; and to hold an agricultural fair and bazaar in New York City in 1913, where products raised by Jewish farmers will be exhibited and sold directly to city consumers.

#### IMMIGRATION LEGISLATION

Representative Henry, chairman of the Rules Committee of the House, has stated that every means at his command will be given to aid in the passage of the Dillingham immigration bill, which passed the Senate last summer. This bill includes an illiteracy test requiring that aliens coming to the United States shall be able to read and write in the language of their country. Certain exceptions are made for countries where there is religious persecution. Opposition to this measure is illustrated by a recent caucus of the Democratic representatives from New York state, which met in the office of Governor-elect Sulzer, and, it is announced, unanimously voted to stand out against the bill. The situation, therefore, is at this writing a confused one. As the legislative mechanism of the House is of such a nature that it is perfectly possible for three or four powerful members to hold up legislation indefinitely, it is within the range of likelihood that the bill will go over till next session at least.

# INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

## Child Labor

National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

## Recreation Bibliography

Division of Recreation of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. Pamphlet containing a list of the more formal publications, with annotations, and an extensive list of magazine articles dealing with the subject of recreation. Price 10 cents per copy.

## Tuberculosis

National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M. D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual Transactions and other publications free to members.

## Working Women

National Women's Trade Union League, to better industrial conditions through organization and legislation. Information given. "Life and Labor," events in industrial world. Three months for 25c. Mrs. Raymond Robins, Pres., 127 N. Dearborn St., Chicago.

## Prison Labor

National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph.D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

## Child Helping

Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York.

Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

## Conservation of Infant Life.

American Association for Study and Prevention of Infant Mortality, 1211 Cathedral Street, Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request.

Studies preventable causes of death and illness; urges birth registration, maternal nursing, parental instruction.

## Sex Hygiene

Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies.

Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

## Mental Hygiene

National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene, State Societies for Mental Hygiene.

## Women in Industry

National Consumers' League, 106 East 19th St., New York. Mrs. Florence Kelley, Gen'l Sec'y. 87 branch leagues. Reports, pamphlets sent on request. Minimum membership fee \$1.00 includes current pamphlets. Minimum wages boards, protection of women workers, pure food, sweatshops, etc.

## Young Women

National Board, Y. W. C. A., 600 Lexington Ave., N. Y. C. Official magazine: *The Association Monthly*. Pres. Miss Grace H. Dodge. Gen. Sec'y., Miss Mabel Cratty. The advancement of Christian Social Service. Free literature (all departments).

## The American Seamen's Friend Society

Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y. The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

## Recreation

Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y.

Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

## Mental Deficiency

The American Association for the study of the feeble-minded, publishes the proceedings and papers of its annual meetings in the *Journal of Psycho Asthenics*. Address Dr. A. C. Rogers, secretary, at Faribault, Minnesota.

## School Hygiene

American School Hygiene Association. Pres., David L. Edsall, M. D.; Harvard University Medical School; Sec'y., Thomas A. Storey, M. D., College of the City of New York, New York. Yearly congresses and proceedings.

## National Health

Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York.

To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

## Evening Clubs for Girls

National League of Women Workers Hotel Savoy, New York. Organizing Sec'y., Jean Hamilton. Recreation and instruction in self-governing and self-supporting groups for girls over working age. Monthly magazine—"The Club Worker" Twenty-five cents 1 year.

## Labor Legislation

Workmen's Compensation; Industrial Hygiene; Labor Laws. Official publication: *American Labor Legislation Review*, sent free to members.

American Association for Labor Legislation, Metropolitan Tower, New York City. John B. Andrews, Secretary.

## Short Ballot and Commission Government

The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

## Municipal Problems

National Municipal League, 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

## Charities and Correction

THE PROCEEDINGS of the National Conference of Charities and Correction sent free to each member. BUREAU OF INFORMATION on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 5, 1913.

Believing that the "reasoning" of both the Suffragists and the Anti-Suffragists is wrong,

MRS. MARGARET DELAND  
PRESENTS

### THE THIRD WAY IN WOMAN SUFFRAGE

outlining a plan by which men—for Mrs. Deland says "the men must decide it"—can reach the wisest solution of this problem, while now they are urged, teased and confused by a loud and clamorous lot of women on one side and "a brainless femininity" on the other. In this carefully thought-out article, the author of "The Iron Woman" makes a distinct contribution to the equal suffrage question. It is published in

The Curtis Publishing Company, Independence Square, Philadelphia

## THE PITH OF IT

"IT IS within the power of man to rid himself of every parasitic disease," said Pasteur, and as if to justify his words, London has within two decades virtually cut her death rate in two. But this is only the beginning of what we may expect in the prolongation of life, thinks Irving Fisher, who surveys the whole public health movement in this issue. P. 370.

SENATOR LAFOLLETTE has introduced a bill into Congress limiting the hours of working women in the District of Columbia to eight in one day and the number of days to six in one week. P. 344.

WHEN Governor Baldwin, of Connecticut, in discussing modern ideas of prison reform before the House of Governors, scored "sentimental humanitarians and theoretical psychologists," many wondered whether he possibly had in mind Governor Shafroth, of Colorado, who told of trusting 400 convicts on the roads with no other guards than trustees; or Governor Eberhardt, of Minnesota, who said he would like to see prisoners get more pay and the state less profit from their work. The governors effected a permanent organization. P. 347.

A NEW spirit in factory inspection has appeared, says Irene Osgood Andrews; it is the spirit of co-operation and education, and at least three states have started out to attain it. That it is necessary Mrs. Andrews shows by briefly summing up the tale of miseries annually caused by accidents to workers. P. 355.

"A BOY has a right to grow up," said a speaker at the housing conference, "in a neighborhood where he can identify his home without looking at the number." As Jacob Riis puts it, the "most determined note was to call for a general housing law to cover all the land and the dwellings thereon, in the interest of all the people." P. 349.

THE physicians of Great Britain have been carrying on an animated discussion about the fees under the new Insurance Act. Meanwhile their fellow-craftsmen in the United States are looking at the larger significance of the law—declaring, to quote one writer, that it indicates—"an assumption, on the part of the government, of the responsibility of providing proper medical care for citizens who are financially unable to secure it for themselves." P. 367.

WOMEN in blue coats have appeared in the East, three of them having been attached to the regular police force in Baltimore City. On the Pacific coast, where they have become numerous enough to hold their first annual conference, they declare that women are of more value than men in remedying the vice conditions of a city. P. 345.

IN SINGLING out for attack such specific evils as child labor, overwork, underpay and ill health, the Federal Council of the Churches of Christ in America made important additions at its recent quadrennial meeting to the declarations of social faith already enunciated by other religious bodies. An "ecumenical council" is the phrase used by our correspondent to describe the world breadth of the outlook there found. P. 368.

DECLARING, among other things, that almost all European and American precedents are against forcing the cost of accident compensation back upon the workers, I. M. Rubinow argues the advisability of rejecting the brewers' compensation and pension plan. Hugh F. Fox, of the Brewers' Association, replies that the plan was carefully drawn by competent actuaries and that Mr. Rubinow, also an actuary, is not sufficiently familiar with the brewing industry to predict how it will work. Pp. 360, 363.

## THE COMMON WELFARE

### HOME WORK AND THE HOLIDAYS

The Christmas spirit in New York has been disturbed by the hearings on home work before the State Factory Investigating Commission.<sup>1</sup>

The sanitary conditions described have been of the sort to give fidgets to shoppers of wearing apparel. But it has been the facts as to pay and hours, under which women and children do this work sent out to the tenements by various lines of factories, which have reached to the conscience of the community.

The conditions are themselves more or less an old story to readers of *THE SURVEY*, but the season at which they have been brought out has gained an altogether new reception for them. Moreover, new and startling instances of how not only the cheap lines to be bought on Fourteenth Street, but the goods to be bought at certain Fifth Avenue shops with exclusive names are frequently worked on in tenements, have been gathered by a special staff, working under Elizabeth Watson.<sup>2</sup>

One of the commission's investigators found that some of the handmade linen of the "richest babies" in America was made in a home not subject to inspection. A good part of the "French" handmade or hand-embroidered underwear, bed and table linen comes to us from the tenement house, as does the hand embroidery on our "best" shirt-

<sup>1</sup>See *THE SURVEY* of March 18, 1912.

<sup>2</sup>The early part of Miss Watson's investigation was exhibited last spring and described in *THE SURVEY* of April 6 last. The distinctive thing about the exhibit was its coherency, being designed to show the manner in which home work violates the letter or the spirit of the successive clauses of Child Labor and Compulsory Education Laws.

waists. At embroidery alone on both underwear and outside garments some 61,000 outworkers are employed. The same situation prevails with many other things in daily use. Nuts are picked and sorted by tenement children. "Sanitary" hairbrushes, the output of a firm which boasts in large advertising type of its sanitary factory and in small type advertises for home workers, are fitted with bristles on tenement dining tables. Babies of a hundred cities play with tenement-made or finished toys. The paper tubes of cigarettes are rolled by tenement hands, and their edges, when the paste goes dry, are licked by tenement lips. Through the homes of one hundred Greek families in New York no less than one million cigarettes pass each year. The women suffragists of New York, who make the protection of their homes, as well as labor laws for women and children, planks in their platform, scarcely realized that their husbands were bringing home tenement licked "Votes for Women" cigarettes from Hammerstein's Suffrage Week.

With these tenement products, come not only dirt but disease germs. Miss Watson's list of contagious diseases found among outworkers is startling. One employer who lets out home work told of the death of his own child by diphtheria brought to her from a tenement home. Dr. Annie S. Daniel, of the out-patient department of the New York Infirmary for Women and Children testified that she had in the last year found contagious disease in the households of no less than seventy-nine tenements workers.

But after all, these seventy-nine cases speak even louder of the danger of disease to the out-worker than to the well-fed, well cared for con-

sumer. The youth of the workers, their long hours and low pay are the things that make them peculiarly susceptible to disease.

Miss Watson's tables, based on intensive study of 204 of the homes visited, give some idea of home work under the three heads of age, hours, and pay of the workers. On the score of age the lisping reply of one child tells volumes. This was a tiny girl of about five who on being asked how long she had been at work, answered: "Ever since I wuz—". The tables show 24 per cent of the workers in the 204 homes visited to be between five and ten years old; 45 per cent under fourteen and 60 per cent under sixteen. As to hours the tables show that during the season 24 per cent of the adult home workers work eleven hours or more; of the children, exactly one quarter work after school five hours or more every day.

On the score of pay, the tables show that 76.5 per cent of the families earned less than ten cents an hour as families. The earnings of the separate members were not computed. One employer's pay roll showed an average of \$1.47 earned by a family of one adult and one child. Crochet work is the worst paid work, next feathers, then beads. On underwear, children of all ages can be put to work, and the average, from a pay roll of families in this work, was therefore higher, \$4.83.

Some of these little home-working girls get out to play, not while the daylight lasts, for that is good to work by, but late at night. What this night play on the streets of New York may mean to some of these was suggested by Maud Miner, probation officer of the Women's Night Court, who testified before the commission.

#### 8 HOURS AND 6 DAYS FOR WOMEN IN D. C.

Robert M. LaFollette, United States senator from Wisconsin, has revised his bill regulating the employment of women in the District of Columbia and last week submitted it to Congress again. It calls for an eight-hour workday and a six-day week for all women employed in factories and workshops. Consumers' leagues, federations of women's clubs and other organizations interested in bettering the working conditions of women, are declared to be in favor of this measure. Something of the attitude of the present Congress toward similar legislation for men may perhaps be indicated by the passage at the last session of an eight-hour law applying to firms working on government contracts.

The scope of Senator LaFollette's measure is indicated by the first section, as follows:

"No female shall be employed or permitted to work in any mill, factory, manufacturing or mechanical establishment or workshop, includ-

ing, among others, any laundry, bakery, printing, clothing, dressmaking or millinery establishment, store, hotel, restaurant, office or where any goods are sold or distributed, or by any express or transportation company, or in the transmission or distribution of telegraph or telephone messages or merchandise, more than eight hours in any one day or more than six days or more than forty-eight hours in any one week."

The bill also prohibits any girl under eighteen from working before 7 o'clock in the morning or after 6 o'clock in the afternoon. A notable feature of the measure is that it puts upon employers the task of finding out whether their women employees are engaged in other work, and if so of seeing to it that the total time of their employment does not exceed that allowed in a single establishment.

To enforce the law three inspectors are to be appointed by the district commissioners.

#### CHRISTMAS SALE OF RED CROSS SEALS

Preliminary reports indicate a larger sale of Red Cross Christmas seals this year than in any previous season. The National Association for the Study and Prevention of Tuberculosis estimates that the number purchased will probably reach 40,000,000, and that it may even be as high as 50,000,000.

Over 100,000,000 seals have been printed for the 1912 campaign. Millions of pieces of advertising matter have been distributed. No less than 100,000 workers have co-operated in the campaign, and the active agents selling the seals, including stores of every kind, booths located at almost every conceivable point of vantage, individual agents and others, will amount to well over 25,000. Very few commercial concerns organize for so short a time a campaign as far flung as the Red Cross seal movement.

Seals have been sold in every state, with the exception of Wyoming, Idaho, Nevada, Oklahoma and Florida. In the latter an independent seal issued by the State Federation of Women's Clubs has been on sale. The Red Cross seals are no respecters of persons. Society women, leaders of "the four hundred" in almost every large city, have superintended booths, sold seals in hotel lobbies, helped to pack them, and have canvassed from house to house to raise money for the prevention of tuberculosis. The shop girl, in her sphere, has been no less active or successful. A cashier at one of the large department stores in New York City, disposed of nearly \$100 worth of seals to her friends and customers. Even governors and mayors have co-operated in the campaign. Governor Dix auctioned the first sheet of seals in Albany for \$130. The mayor of Rochester was even more successful and knocked down the first sheet in that city for \$434. Proclamations and letters of

*Phil in the Trenton Times*  
SHOP BEFORE NOON—IT PAYS

commendation have been issued by governors and mayors throughout the country. Working men have responded by buying seals through labor union headquarters, in their factories and elsewhere. Churches, lodges, clubs of all sorts and kinds, bankers, brokers, merchants and men and women in every walk of life, have striven to make the campaign a success.

#### NEW YORK'S PROTEST AGAINST BUDGET CUTS

In response to insistent requests from civic and charitable organizations and private individuals throughout the city, Mayor Gaynor granted a public audience to hear arguments both for and against the cuts made by the Board of Aldermen in the New York budget for 1913. The reductions voted by the "city fathers" aroused a spontaneous opposition among welfare workers because so many of the slashes affected social service activities for which public-spirited citizens had fought. Following the hearing Mayor Gaynor by a veto message sent to the Board of Aldermen on December 10, restored \$212,000 of the \$583,000 which had been eliminated. Among the items put back are appropriations made to the Board of Health for child hygiene, the prevention of tuberculosis and social service work amounting to \$85,000.

The mayor also restored appropriations for the Civil Service Commission, for the standardization of supplies for social service nurses in the charities department and for keeping health records in child-caring institutions. The largest single cut, which was \$229,000 for special teachers in the public schools, was allowed to stand. The reason assigned was that the Board of Educa-

tion has persistently refused to furnish the data which is essential to the consideration of its budget. The mayor said it was impossible therefore to know whether the reduction was unreasonable or not. He intimated his belief that probably the school officials would not be hampered owing to accruals arising from replacing teachers who die or resign by younger ones at smaller salaries. Another reduction which was not vetoed was that in the appropriation for the Playgrounds Commission.

#### WESTERN WOMEN AS POLICE OFFICERS

Everyone knows that in the United States and other western countries the steady progress of women toward active citizenship and public service is gradually emerging from a nebulous into a more and more clearly defined state. Because the process is so even and widespread it is intangible, and we eagerly dissect all substantial indications of its growth. This is one reason why there has been considerable interest in the first conference of women police officers, held recently in Portland, Ore. The meeting drew attendance only from the Pacific Coast, but thus served the better to point out in what part of the country women police officers are taken for granted. At the close of three days' discussion it was decided to effect a permanent organization at Seattle at the time of the National Conference of Charities and Correction.

Cities were variously represented: San Francisco by the travelers' aid secretary of the Y. W. C. A. who, with four assistants, comes in contact with 10,000 women and girls every year; Sacramento by a woman in the pay of the South-

ern Pacific Railroad and the Y. W. C. A., who works both in the station and out; Oakland by two representatives of its vice commission and the general secretary of the Y. W. C. A.; Seattle by both regularly appointed women members of its police force and a special police officer who works under the pay and auspices of the Y. W. C. A.; Spokane, North Yakima, Tacoma and other cities on the northwest coast by protective officers regularly appointed to the police force.

In many of these cities the same pioneer demonstrations of the usefulness of women in improving moral conditions had to be made before they were entrusted with public duties. A typical story is that of Lola G. Baldwin, of Portland, who was elected president of the temporary organization of the conference. The need of protective work for girls had been plainly seen by a few citizens of Portland for some time, when the exposition emphasized it. To meet this need traveler's aid work was organized by the Y. W. C. A. and Mrs. Baldwin was put in charge with two assistants. At the close of the fair the immense good which had been done and the number of girls remaining in the city caused the work to be continued. For three years it was carried on by the Y. W. C. A., Mrs. Baldwin being given police power and being sent for by the police every time a woman was brought into court.

As her work often brought her into contact with the regular police department, it was deemed wise to turn it over to the city and ask for a special appropriation. Immediately there was opposition. But when it was pointed out that the request was for only half the sum—\$6,000—which the city was spending on its dog-pond, the financial side of the case was won.

When Mrs. Baldwin, after her appointment as city employe, tried to get the side doors to saloons and public dance halls closed, she was twice threatened with shooting, once received a package of poisoned tea and once was told that if her activity didn't cease a way would be found to get rid of her.

The view was expressed at the conference that a new movement for women protective officers in a community ought to be started under the auspices of a women's society. This would enable its possibilities and point of view to become well established before the work was brought into intimate relation with the police force. The change in the system may then usually be effected by an ordinance, although Portland thought it better to incorporate the reform into the city charter.

When the question of cost was brought up, figures were given to show that the *per capita* price of police protection last year had been \$3.50 in New York, \$2.43 in St. Louis, \$2.46 in Philadelphia, and \$2.13 in Chicago, whereas in Portland the cost had been \$1.09.

Only through the appointment of women officers, declared the chief of police of Portland, can the problem of city vice be solved. He said that if he put fifty men on burglary cases they would come back better and wiser; but if the same fifty were assigned to cases involving sexual immorality, the chances were that "in thirty days half of them would have fallen for the paint and powder, and beguiling ways of the women who prey on man's weakness."

Three main conclusions seemed to rise naturally from the discussion. First, women will work harder than men to protect and save and will think less of punishment in dealing with those who are destroying themselves and others through vice. Second, women will do better work than men in cleaning up the vice conditions in a city. Third, women should be appointed on the pay roll of the city under some sort of supervision or co-operative work with volunteers of their own sex. It was declared that every city should have at least one protective officer for every twenty-five policemen.

#### EASTWARD TREND OF THE MOVEMENT

Not in the extreme West alone are women police officers to be found, however. A year ago the movement reached Minneapolis, where as yet only one has been appointed. A month ago George Creel, Commissioner of Police of Denver, appointed as a member of the detective bureau, Josephine Roche, who will be intrusted with the execution of the new dance hall ordinance<sup>1</sup> and will aid in the fight against the social evil. Miss Roche was last year connected with the Vocational Guidance Survey of New York. Still more significant of the growth of the movement, however, is the fact that there are three police women in Baltimore, and one woman detective in New York. A Maryland law of 1912 provided for five, calling them "matrons to the police force," to distinguish them from "station-house matrons."

Mary S. Harvey, for ten years connected with the Federated Charities, was the first to be appointed. Two months later Elizabeth Faber, a Swiss who speaks fluently English, French, German and Italian, and Margaret Eagleton, also connected with the Federated Charities, were named. Their work is varied. Minors of both sexes are looked after; moving picture parlors are watched; balls and dancing classes are supervised; prostitutes who are reported as entering a house of ill fame for the first time are visited. Any preventive or aggressive work that a woman can do seems to come under what may be called police-woman's work.

The Philadelphia director of public safety, after listening to the arguments of Alice Stebbins Wells, of the Los Angeles police force,

<sup>1</sup>See THE SURVEY, September 28, 1912, p. 788.

announced that he would request at once the appropriations necessary to employ women detectives. Mrs. Wells is visiting various parts of the country to widen her acquaintance with police methods and conditions elsewhere, and incidentally she is securing publicity for arguments for putting women in uniforms.

## THE GOVERNORS CONFERENCE

A. J. McKELWAY

The "House of Governors," may better be termed an experience meeting than anything else. Each governor explains the practices of his state and its method of solving the various problems under discussion. At the Richmond meeting early this month—the sixth since Ex-President Roosevelt first called the body unto being—one listened in vain for any scientific or, in most instances, any very advanced treatment of present day problems. The organization seems to have become an informal one, the chief benefit of which is the exchange of gubernatorial experiences and the delivery of individual opinions. Fully half the states were represented this year and the people of Richmond overwhelmed the visitors with their hospitality.

Penology was the topic of discussion the first afternoon of the conference. It was illuminating, at least in so far as it indicates a great educational work yet to be accomplished by such organizations as the National Conference of Charities and Correction and the American Prison Association.

Governor Shafroth of Colorado gave an interesting account of the working out of his theory of trusting convicts to observe obligations under humane treatment. During the last four years in his state only four prisoners have escaped, and there has been no general plot to escape. Half the prison population, which numbers 800, out of 800,000 people, are working on the roads without guards other than trustees. Governor Shafroth declared he was about convinced that paying convicts for the support of their families was wise; and that he favored the indeterminate sentence as an alternative of a too free use of the pardoning power.

Governor Baldwin of Connecticut had a good deal to say about the "sentimental humanitarians and theoretical psychologists,"—about, as usual an introduction to the opposing of all modern ideas of prison reform as the reference to the capitalist system is to a Socialist speech. Instead of the indeterminate sentence for some criminals—wife beaters or burglars who torture their victims—he favored the restoration of the whipping-post, as the "apprehension of bodily pain is a strong deterrent, and whipping is often the best incentive to education and

reform." Governor Baldwin made a fine legal distinction between the folly of keeping a man in prison at the will of one man or a set of men, and sending him there with his exact term of punishment measured out for him by a judge or a jury.

Governor Donaghey of Arkansas had never pardoned any man sentenced for carrying concealed weapons or selling whiskey. Usually, he declared liquor was the cause of lynchings. He denounced the convict lease system as one that "murders men alive." Governor Hadley of Missouri, said that he had paroled 450 men under twenty-one years of age, only thirty of whom had broken their parole. Governor Eberhardt of Minnesota opposed capital punishment, took a shot at the present jury system, declared there were "fifty-seven varieties" of insanity that a prisoner might plead, and believed in abrogating the right of appeal except where there had been a miscarriage of justice. He criticized the prison labor system in saying that his state had a twine factory that made \$150,000 in profits while only \$3,000 was paid to the families of prisoners, and he would like to see the men receive more and the state less. Governor Gilchrist of Florida announced that one variety of crime he never pardoned—the stealing of trust funds.

At this point the first real sensation of the conference was felt when Governor Blease of South Carolina took the floor. He defended his pardon record, especially the releasing of Negroes who had been sentenced for long terms for slight offenses. He also condemned the prison labor system of South Carolina saying that he had found the hosiery mill in the penitentiary a tuberculosis incubator, the inmates being constantly sent to the tuberculosis hospital and the prison farm to recover their health. He said he had pardoned 400 persons in twenty-four months, and hoped to make the record 800 before his second term expired. The governor then launched into the theme of lynch law for one crime and declared that he would never order out the militia to quell uprisings of people who threatened the life of a black man who had laid his hands upon a white woman.

Governor O'Neal of Alabama in reply denounced lynch law, told how a sheriff in Alabama had been removed from office for allowing a lynching, and that his warning to another sheriff had resulted in the protection of a prisoner though the sheriff had to pay fifty dollars for the hire of an automobile to do it. For that reason there had not been a lynching in Alabama for four years.

Governor Kitchin of North Carolina said that a jury in his state might be trusted to punish lynchers, and therefore there had been no lynching in that state for six years. Governor Mann of Virginia declared he would order out the

whole state militia to protect any prisoner, and that there had not been a lynching in Virginia in eight years.

The question on many lips was how Governor Blease could reconcile his refusal to enforce the laws of the state with his oath of office, and during the discussion of the divorce problem, Governor Carey of Wyoming asked it. Governor Oddie of Nevada had been discussing the uniform divorce law. He said that Nevada was not proud of Reno, that most of the divorce colony came from five eastern states with too ancient divorce laws. However, Nevada he said had declared for a reform of her law at the last election, by requiring a residence of a year instead of six months, in voting for legislators. He took the "civil contract" view of marriage explicitly and said he believed that divorce should be treated from the standpoint of eugenics rather than according to the conventions of religion. He favored a uniform divorce law, but not one drawn on too strict lines.

Governor Hawley of Idaho suggested that health certificates be required for marriage, and as a working basis for a uniform divorce law suggested that divorces should be granted for five reasons only. Governor Carey wanted no divorce law, and Governor Baldwin raised the point that the fourteenth amendment forbade legislative action on this subject and that he had vetoed a bill granting divorce for special reasons. Then Governor Blease took the floor. He defended the provision of the South Carolina constitution which says that no divorce shall be granted for any reason, and drifted into an allusion to the marriage of Jack Johnson to a white woman, saying that this could not happen in South Carolina. He declared that he was a real friend to the Negro, notwithstanding the misrepresentations of his attitude.

Then Governor Carey asked him about his oath to support the constitution, and he said: "Whenever the constitution of my state steps between me and the defence of the virtue of the white woman, I will resign my commission, tear it up and throw it to the breezes and march to the defence of her honor and her virtue." He then quoted from one of his campaign speeches in South Carolina which, he said, 75,000 people had endorsed in the last election: "If the constitution causes my state to blush and allows her women to be forsaken, then I say 'To hell with the constitution.'" At this point half the women present left the hall. There was another fiery outburst from Governor Blease when the conference passed what was virtually a resolution of censure. The resolution, offered by Governor Mann, was as follows:

"Resolved, that it is the sentiment of the governors' conference that the whole power of the several states should be used whenever necessary

to protect persons accused of crime of every kind against the violence of mobs and to provide for speedy, orderly and impartial trials by courts of competent jurisdiction, to the end that the law for the protection of life and property be duly enforced and respected by the people."

It was really worth the excitement incident to the expression of Governor Blease's peculiar views to show that they were peculiar to himself, at least among southern governors.

Other interesting discussions were on state income tax by Governor McGovern of Wisconsin, the back-to-the-farm movement by Governor Eberhardt of Minnesota, Governor Hadley of Missouri and Governor Mann of Virginia. The irrigation of arid lands and the draining of swamp lands were both thought to be the duty of the federal government.

The problems of rural credits and co-operative loan associations received considerable attention and were discussed quite fully at a gathering following the conference, when the governors met at the White House at President Taft's invitation. A committee was appointed to draft a bill for adoption by the states.

Mary Johnson and Mrs. Valentine of Richmond were given the privilege of the floor for an appeal for woman suffrage.

Perhaps the most effective speech of the conference was made by Kate Barnard of Oklahoma. She pleaded for the conservation of the human assets of the nation, told of the thousands of toiling children, of the six million working women, "whose most important business in life should be the building of the bodies and the souls of little children," and appealed to the governors to recommend the enactment of child labor and compulsory education laws, laws for workmen's compensation and for mothers' compensation, for free employment bureaus, public works for the unemployed, and a minimum wage. Then she preached to them a little, telling them that she had come to them bearing the burden of responsibility for her message, but that she had rolled upon them the burden for remedial action, and that she hoped to be able to congratulate them upon something accomplished when they all stood before the great judgment seat. It did not hurt the conference to have a small dose of religion, and, judging by the way the governors wiped their eyes and crowded around the tiny Oklahoma commissioner of charities, they seemed to like it.

A permanent organization was effected, with Governor McGovern of Wisconsin, Governor O'Neal of Alabama and Governor-elect Ammons of Colorado as the Executive Committee, which elected M. C. Riley of Madison, Wis., executive secretary. The conference will meet at Colorado Springs next year.

#### HOUSING EXPERTS SIZING UP PHILADELPHIA

## CIVICS

### THE NATION-WIDE BATTLE AGAINST THE SLUM<sup>1</sup>

JACOB A. RIIS

[Reprinted from the *New York Sun*.]

Less than three years have passed since the National Housing Association was organized to carry the war on the slum into the farthest corner of the land, wherever it might be burrowing, and thirty full-sized automobiles were not enough to carry the delegates to its second annual conference about Philadelphia to hunt it in the town whose proud boast is that it is a city of homes.

They came from far and near, from Maine and California, from Washington in the far Northwest and Georgia in the South, and from across the border of Canada, from twenty-three states and provinces, and from seventy-six cities. The Dominion government sent a representa-

<sup>1</sup>Two of the New York newspapers sent Jacob A. Riis to Philadelphia to report the second National Housing Conference. Mr. Riis's lifelong battle against the slum has made him perhaps the one writer in America best qualified to catch and interpret the spirit of this meeting. His article in the *New York Sun* of December 8 seemed to the officers of the National Housing Association so valuable from this point of view that after getting special permission to use it they have asked THE SURVEY to publish it practically in its entirety.

tive, and so did the Public Health Service of the United States. City health officers without number took notes. Chambers of Commerce, City Clubs, Civic Leagues, great corporations which face the problem of securing good homes for their employees, charity organization societies whose work is so largely due to bad housing, builders, life insurance companies, building and loan associations and more than a score of housing associations or committees, sent delegates.

When they all got together they owned to a common stake in the war upon the common enemy. "There is not a growing town in the United States that does not know the slum," they declared, and the health officer of Toronto added that to deny its existence was to admit lack of investigation.

^ If any community had kept it out it might be supposed to be William Penn's town, for he built it with the ideal in mind of a "wee small bit of green grass in every dooryard" to be-

guile his people into the belief that they were still in the country. That was why the delegates had come here; but they had not been awheel twenty-minutes before they were in a worse slum than most of them had seen in many a day.

The Philadelphians took them straight to the old quarters where nasty alleys abound and showed them tumble down tenements, malodorous cesspools, undrained yards and passageways, cellars full of water, and when they stood aghast they told them that there were thirty or forty thousand vaults and cesspools in the city, whereas on Manhattan Island there is scarce one left.

"But why?" chorused the delegates. "These streets," was the answer, "have no sewers or the houses are not connected."

In every alley there was a lamp post with a gasoline burner. "Who put this post here?" asked one of the health officers. "The city." "How does it come that the power which put it there does not drain the alley, too? It is at least as important." The post made no answer. The inquisitive official eyed it meditatively and asked another question: "Who lights the lamp?" "It is a private corporation," explained the native without pride; "it has a contract with the city."

"Oh," said the health officer and scratched the head of a gray cat by the hydrant.

When, the next day, the automobiles rolled past miles upon miles of little two story houses, new and neat, and were told that fourteen thousand of these had no sewer connection either because there were no mains under the pavements, the wrath of the chief sanitary inspector of Chicago found vent in the exclamation: "Then, why don't you get them? We can tell you the way in Chicago: Not a house let them build till there are sewers in the streets!"

In the conference that afternoon Chief Inspector Buchholz of Philadelphia's Tenement House Division offered the city's excuse. It was, he said, a question of money. Philadelphia needs six millions of dollars for sewers and has appropriated a million and a half in the last twelvemonth. All the previous council was able to afford was \$7,500.

The far famed small homes of the Quaker City are built on shallow lots, with a minimum width of fourteen feet and depth of forty-one. There are 200,000 such in Philadelphia. Some of them are very pretty, with gardens in the middle of the street; mostly the delegates found the unending brick blocks, with their expressionless fronts, rather trying.

"A boy has a right to grow up," cried one exasperated member, "in a neighborhood where he can identify his home without looking at the number," and the conference applauded wildly. For all that, there were workingmen's homes at rents within their reach, \$13 to \$16.

But the automobiles took the delegates at last to a place that made them feel at home. They halted in Mifflin place at one of the properties managed by the Octavia Hill Association. There were the old houses in which the British officers made merry in the winter when George Washington's army froze and starved at Valley Forge, a score of miles away. The rare woodwork and carved mantels are there yet, and in the yard the slave houses became tenements like their masters' quarters. Where the tulip gardens were is now a playground common to the children of all the houses, and there are trees and green things in summer.

The old governor's mansion does not seem cast down a bit because poor people live in it, and it needn't. It is in good hands. Mr. and Mrs. Clark, who own it, have handed it over to the association, desiring no profit, not 5 per cent or even one, and yet the profit is there, to be still further applied to the further reduction of the rents. For the property is managed with such skill and care and such mutual good will and helpfulness that last year's bill for repairs due to carelessness of tenants in all the 500 houses of which these in Mifflin place are a sample was just \$50. Hence, when the question was asked in the conference what blame the tenant bore for bad housing conditions their representative answered promptly "None." That was Philadelphia at her best.

When President Robert W. de Forest's gavel fell in the hall of the Young Men's Christian Association he looked upon seats filled with clear-eyed men and women, fellow fighters all, and he smiled at the sight, for he saw the finish of the slum. "We are here to help," he said: "let us aim at practical things. Do not let us try to do everything, for we can't. Some things we can do; let us pick the most important and do them and everywhere let us hold up the hands of our officials at home, not merely pursue them with hostile criticism."

Then the floodgates were opened, and for three days paper followed upon paper, speech upon speech, and never a delegate left his or her seat except to go out to luncheon at the Hotel Walton. But they had no sooner sat down there before the gavel banged once more and reports kept flowing in from every point of the compass of what was doing at home. Mighty interesting were they, too, in all their brevity. The city of Cleveland reported that her mayor cared a good deal less whether his town would have a million inhabitants in 1920 than whether it would be a fit place for a million souls to live in. Chicago's Association of Commerce declared that it had picked out its job, namely to get a big enough appropriation for the Health Department to enable it to do good work. Boston, said the secretary of the Massachusetts Civic League, was waking up, but hadn't hurt anybody yet.

The trouble was that Boston people were satisfied.

Cincinnati was hopeful in that it had just found out how sick it was; and so on." It was always a word of cheer, even when it was bad, for that meant that it was going to get better right away. Even Philadelphia herself declared that she had just wrung from the general assembly power to put water into the alley shacks—not much, only one hydrant for every house with a yard and one for every three without, but it was a beginning.

"We don't usually speak of these things," said Newman of the housing commission, "before strangers. Only today when they were brought up in our state conference we were charged by a member of the assembly with defaming our state. It was good enough for him, he said. He would rather be hanged in Pennsylvania than die a natural death in any other state." The reformers sighed. They knew the signs; behind them the slum barrens unchallenged ever.

The whole range of human experience and endeavor did these reformers traverse with unabated enthusiasm, for all paths led these days to the housing problem. The balance they showed was no less noteworthy than their zeal. Cried one: "We have cemeteries aplenty, fine hospitals and institutions without end in which to keep the brother whose home we neglected, but they altogether did not answer the challenge, 'Am I my brother's keeper?'" The housing question is not merely a sanitary problem—it is a human problem, and it holds in our cities the right answer. Until we house our people decently we cannot make them efficient workers.

Politics got many a hard knock in the conference. Until health departments ceased to be a football of politics they would never justify our hopes. That advice came from Canada, too. Woman's place in the fight was never in doubt. She was needed as an instructive sanitary inspector, in the tenement family, leaving to uniformed men the stern enforcement of law. But some things she could do better, for instance to teach the tenant that the family bed was not a good place to raise the family's bread in. A cheery note of faith in the tenant was sounded by that untiring pioneer in model tenement building, Alfred T. White of Brooklyn, who, after thirty years, is at it yet.

"If I had my life to live over again," he cried, "I would rather do without any other investment I have ever made than the one I made in tenement houses," and he bore witness to the willingness and fitness of tenants as a class to profit by whatever opportunities were put in their way. "We hear no more of the old libel that they won't take care of the improved houses. Who nowadays opposes stringent legislation? Not they, but the landlords. The health of the people is the test of civilization. When we find the death rate going down to nearly one-third in step with tenement house reform we know that we are on the right road." And he added that the tenants could better afford the higher rents than the old slough and its mor-

tality; that really they were gainers and knew it.

In American cities the inadequate powers of many of our health departments has proved a stumbling block in the way of improvement. Ontario cities have an advantage in this respect according to one of the Canadian delegates.

In Toronto the health officer ordered a member of the Council to abate a nuisance. His dignity ruffled, he sought out the city solicitor, who listened to his grievance. "Did the health officer tell you to do that?" he asked. "He did." "Then all I can tell you is that if the health officer tells you to go to hell, you've got to go."

The conference heard all the theories and squared them by all the facts. The factories ought to go to the suburbs, but they can not and will not go unless they have adequate transportation facilities. Wage earners would be better citizens and industrial conditions more stable if they owned their homes, but if paying for them was too great a handicap exactly the reverse might happen and the standard of living be fatally debased in the effort. Small family houses are better than tenements, but tenements can not be entirely abolished.

In New York, Tenement House Commissioner Murphy reported things were mending fast. Landlords were coming to see that co-operation with the authorities, not opposition to improvement, paid them best. Washington had torn down 1,503 hopeless tenements since 1907, Boston 1,138 in eleven years, Cleveland 220 in a single year. The national capital still has its 275 alleys left, in which the baby mortality is 375 in each thousand of the population, while in houses fronting on the street it is 157. But Congress bears the blame for that and can fix it. The ancient evil of the lodger in tenement families is about to be attacked. Need and greed of the tenant, said Lawrence Veiller, are the causes of it with race solidarity. The proposition is to forbid the lodger except with consent of the Health Department, and make the landlord responsible.

Though the thousand dollar house has not yet been discovered, the conference agreed that Philadelphia had, after all, come closest to it. Its most determined note was to call for a general housing law to cover all the land and the dwellings thereon, in the interest of all the people. And so it passed out, with the warning of Ambassador Bryce at the closing dinner, that do what we might to help, our cities were growing a menace in their bigness, and that the stand of the mayor of Cleveland was, after all, the one worth taking. Bigness is no cause for pride; only fitness is.

#### INTERNATIONAL CONFERENCE ON PUBLIC BATHS

Three hundred delegates from the Netherlands, Austria, Germany, Belgium, France, Norway, Sweden, Italy, Spain, and Greece and the United States attended the first International Conference on People's and School Baths at Scheveningen, The Hague. It was regretted that the State Department at Washington declined

to send a delegate, which left the United States without official representation to the conference. The American Association for Promoting Hygiene and Public Baths, however, was represented by three delegates, Dr. William Paul Gerhard, Rev. Thomas M. Beadenkoff and William H. Hale.

An instructive exhibition formed a part of the conference. The largest number of plans were from German cities, which have paid particular attention to the establishment of people's and school baths. The borough presidents of Manhattan and Brooklyn sent an exhibit which was in charge of William H. Hale, the superintendent of the Brooklyn Public Baths. The New York Board of Education also exhibited many photographs of school baths.

The program of the conference, which lasted three days, was supplemented by a number of excursions, receptions, concerts and banquets. These were arranged for by the Netherland Union for Public and School Baths.

At the first business session, the delegates from the different countries presented reports on the status of the public bath question in their countries. The Progress of the Public Bath Movement in the United States was summarized by Dr. Gerhard who presented statistics tending to show that New York, Brooklyn, Chicago, Boston and Baltimore have done the largest amount of work in the establishment of bathing facilities for the masses. Philadelphia, San Francisco, Washington, Los Angeles and Minneapolis are among the cities making the poorest showing. Syracuse and Utica in New York seem to have failed to act under the New York state law of 1905, which makes the establishment and maintenance of people's baths in cities of more than fifty thousand inhabitants mandatory. Many of the large manufacturing cities, such as Hartford, Springfield, Mass., Trenton, Lowell, Grand Rapids, Fall River, Paterson, Schenectady, Lynn and others, he declared, have done little or nothing to provide cheap baths for the army of working men and women.

Among the papers presented by delegates from the European countries, two by German engineers were considered especially notable for the suggestions which they contained. The first of these was by Herman Recknagel of Berlin on the Construction and Equipment of Swimming Baths, and the other by Oberbaurat Wolff of Hannover on the Planning, Construction and Installation of People's Baths. Herr Recknagel urged that in order to reduce the running expenses, a bath house should be connected with a steam power plant, or electric light works, so that it may utilize the waste steam of such establishments. A distance of even two miles constitutes no objection to the plan. The increased expense for supplying water for public baths from the city water works, he urged, amounts to but a fraction of a cent for 250 gallons, because only the coal for pumping the additional water needs to be considered. He also suggested that the roof over the swimming pool should be arranged so as to slide open, in order to permit in summer time bathing in the open air.

Oberbaurat Wolff in his paper on People's Baths made a special plea both for economic and hygienic reasons for the tepid douche or rain bath. In special cases he urged the instalment of Turkish, electric light and air and sun baths. A point upon which he laid especial emphasis was that the establishment of baths in schools, factories, military barracks and in other special places does not render people's baths any the less necessary.

#### AMERICAN CIVIC ASSOCIATION MEETING

New and important phases of subjects that have been considered more or less fully by the American Civic Association in previous years were presented at the eighth annual conference of the association last month in Baltimore.

George A. Parker, superintendent of parks in Hartford, Conn., urged that public parks can be made self-supporting without curtailing their present freedom, while at the same time increasing their beauty and usefulness. Mr. Parker advocated the maintaining of various park, recreation, rest and refreshment accessories under the direct management of the park boards rather than the usual concessions method. He drew the line sharply between the service as rendered by concessionists as compared to the service that should be given by the park board, whose object would not be primarily the realization of large dividends. Mr. Parker declared that even with better service substantial revenue might be derived, which, together with other special resources of income, would make city parks self-sustaining.

Another address that attracted attention was that of J. C. Nichols of Kansas City, Mo., who told of Creating a Neighborhood by Planning. He described the safeguards which he employed while building a modern residential district in Kansas City to insure the permanency of the locality as a region of homes.

National Parks, the Need of the Future, formed the text of speeches by Walter L. Fisher, secretary of the Department of the Interior, who told of the recent conference on National Parks held in the Yosemite, and by Ambassador James Bryce. Mr. Bryce commended the United States upon its wisdom in securing for its people large areas for national parks, and urged that under no conditions should they be encroached upon by private interests.

Walter D. Moody, managing director of the Chicago Planning Commission, who spoke on Teaching a City's Plan to Its Children, announced that the commission proposed in the near future to prepare a text-book for use in schools in all cities.

The concluding feature of the program was the description by Walter Burley Griffin, who won the prize offered by the colonial government for the best plan for the new capital city of Australia. J. Horace McFarland and Richard B. Watrous were re-elected president and secretary.

#### THE APPEAL OF THE INNOCENTS

One Thousand Young Trees were Killed in Newark Last Year for Lack of Water.

### JOTTINGS

#### A PROBLEM FOR CITY PLANNERS

The National Conference on City Planning is to conduct this year a study in city planning of an area on the outskirts of a growing city of about 500,000 population. The tract is assumed to contain 500 acres of land located four miles from the center of the city but entirely within its corporate limits. Certain facts are assumed in regard to the rate and direction of growth of the city and the demand for the erection of dwellings, retail stores, local places of amusement, schools, churches, etc.

In order to avoid discrepancies in legal conditions, it is assumed that developments of private property are to be governed by the requirements defined in the building code approved by the National Board of Fire Underwriters and in the model tenement house law.

The plan is to include the location of streets and other proposed properties, the development of private lands in accordance with the general plan, and the recognition of such control as might reasonably be expected to be exercised through real estate restrictions.

The purpose of the study is not that of an ordinary competition but rather a means of securing the co-operation of a number of people in preparing and assembling specifications and concrete illustrations of the application of a variety of important ideas and the principles and devices used in city planning.

Further information can be had by addressing Flavel Shurtleff, secretary of the conference, 19 Congress street, Boston.

#### COMFORT STATIONS IN PITTSBURGH

A short and successful campaign in Pittsburgh for public comfort stations came to a close last month, when a proposed bond issue for \$80,000 for this purpose was carried by a majority of 10,000. During the summer the Civic Club of Allegheny County submitted to the county commissioners, the directors of the municipal departments and to each member of the city council, a report regarding the establishment of comfort stations at the post office, on the north and south sides, at the west end, and in East Liberty, Lawrenceville and Soho.

On receipt of this report the mayor requested an approximate estimate of the cost for each proposed station. The council finally passed unanimously an appropriation of \$80,000, which was thereafter known in the bond issue of 1912 as Item 9. Boards of trade, church organizations, political clubs and the press were interested to such an extent that Item 9 for public comfort stations received the greatest number of votes. It carried by the largest majority, while five of the other items were voted down.

#### AN EROSION MODEL FOR SCHOOLS

A working erosion model has been a feature of exhibits made by the Forest Service at recent expositions. It showed the working out of the natural phenomena so well that Don Carlos Ellis has devised a similar model for the use of school classes in nature study, elementary agriculture and physical geography. The model consists of two hills sloping down into two val-

*Courtesy of American Forestry*

#### A WORKING EROSION MODEL FOR SCHOOLS

leys through which two streams wind in and out through farm lands and lead into two lakes at the front of the landscape. Both hills are made of the same kind of soil, but one is covered thickly with twigs to simulate a forest underneath which is a heavy carpet of moss, while the other hill is bare of all vegetation.

By means of a suitable sprinkling device, water in the form of rain is made to fall with equal force upon the two hills. On the unprotected slope the rain washes deep gulleys in the hillside. The erosion on the slope loosens stones; the silt deposited in the channels of the stream diverts the water, which opens up gulleys through the dry lands.

Mr. Ellis, describing his model in a recent issue of *American Forestry*, says:

"While the model is not intended primarily to show more than the erosion processes, it can be used to show also that a forest-covered slope acts as a reservoir in impounding the water and allowing it to seep slowly into the streams, and, on the other hand, that water runs off the surface of a bare slope as soon as it falls, resulting in floods when the precipitation is heavy and in droughts during a dry season. If the sprinkler is stopped and all the water taken out of both of the streams and the lakes, the lake on the forested side will, within a few hours, receive a considerable amount of water as seepage from the wooded hillside, while the other lake will remain practically empty."

#### THREE KINDS OF PLANTING

"My people perish," 'twas said of old, "for lack of knowledge," and as with the people so with the people's trees. This, in a nutshell, is the point emphasized in the last report of the Newark Shade Tree Commission, which points out that 1,000 young trees were killed in the New Jersey metropolis last year for lack of water.

Three kinds of planting are described and emphasized in this pamphlet, as follows:—

"Plant Trees; by all means, plant trees. That's number one. But don't forget to

"Plant Also the Love of Trees. That's number two. For this kind of planting the best soil is the heart of childhood and of youth. And while you are about it

"Plant Likewise Knowledge Concerning Trees. That's number three. Not necessarily the forester's technical knowledge; just a comfortable 'working knowledge,' you know. The leading species and how to distinguish them; how, and what kind, to select for planting—or to reject; how to set out a tree; how to care for and protect it; and so on. Not very recondite knowledge this, and easy to impart—also easy to take in. And useful? Yes, masters, eminently useful; and, if Newark is to do its best in trees, indispensable."

#### ALBANY BUILDS LOW PRICED HOMES

Two years ago in response to complaint because there was a scarcity of moderate priced dwellings in Albany, the Chamber of Commerce appointed a special committee to investigate the matter and report. As a result of its report a building association known as the Albany Home Building Company was organized with a capital of \$100,000. The company purchased two plots, one in North Albany and another just outside the city limits, and has now erected twenty-four two-family houses and thirty-nine single dwellings. The single houses contain gas and electricity and hardwood floors and sell for from \$1,700 to \$4,000 and rent for from \$14 a month to \$35.

The company was organized because it was felt that Albany needed more citizens who owned their homes and because the failure of certain large manufacturing interests to locate in Albany was due largely to the fact that there was no adequate provision for housing their employees. As rapidly as seems advisable the company expects to extend its operations in different parts of the city, provided the demand for houses erected continues.

#### THE NEWPORT SURVEY

A civic survey has been made of Newport, the summer home of the "four hundred" of New York. The investigation occupied a year's time. The report, which was recently published, made charges of lax moral conditions in the city. Among the specific items are references to gambling, both in upper and lower social circles, violation of the speed law by automobilists, and the dependence of young girls from sixteen to twenty-four years on moving picture shows for their recreation.

The survey committee is composed of representatives of the Citizens' Committee, the Charity Organization Society, Y. M. C. A., Civic League, Law and Order League, the Society for the Prevention of Tuberculosis, and the Ministers' Union.

The study of local conditions is to be pursued further for the committee under the direction of Carol Aronovici.

# INDUSTRY

## THE NEW SPIRIT IN FACTORY INSPECTION

IRENE OSGOOD ANDREWS

ASSISTANT SECRETARY, AMERICAN ASSOCIATION FOR LABOR LEGISLATION

Did you ever try to read through the annual list of fatal accidents in the industries of this country?

Here are some samples:

Case 1. "While working at rolls, deceased was struck by bar of steel at white heat as it came through the rollers; abdomen punctured; died within ten minutes; married, aged 25."

Case 2. "Caught on shafting and whirled around to his death; neck dislocated, hands and arms burned, and otherwise disfigured; found wedged between shaft and cylinder of engine; single, aged 39."

Case 3. "He used stick to replace belt on pulley; stick was caught and hurled against him, penetrating the abdomen; killed almost instantly; married, aged 35."

Case 4. "While placing belt on pulley clothing caught on set screw and he was whirled around rapidly revolving shaft, receiving terrible injuries which caused death three hours later at hospital; single, aged 25."

Case 5. "Found in elevator with part of body extending over edge of floor; dead when found; married, aged 76."

Case 6. "While adjusting belt which runs over filter filled with boiling caustic, he slipped and fell into the caustic; terrible burns caused death within few hours; married, aged 42."

Case 7. "Fell into tank of hot chemicals; burns resulted in death nine days later; married, aged 23."

Case 8. "Clothing caught in screw conveyor and deceased was drawn in and 'slowly ground to pieces'; single, aged 22."

After you have finished this year's list try last year's, and the year before that,—35,000 of them a year, at a conservative estimate.

And then do the same for those who only had an arm torn out, a leg cut off, a foot crushed or an eye bored out—500,000 more a year. Then stop and think that large numbers of accidents are never reported at all.

There is always a sequel to these brief bits of history. The charity societies can tell it to you in many cases, and the court records will tell you of the many futile attempts to recover money compensation.

During the second quarter of this year, in New York alone, there were over 19,000 accidents—the largest number for any one quarter ever reported. These accidents were in factories, mines and building construction work only. No one knows the number of accidents not reported. In

addition, under the new law requiring the reporting of occupational disease, 164 cases of industrial poisoning and disease were reported during the first year's operation. And this law is scarcely yet in working order.

Until this year only twenty-three states had laws requiring the reporting of accidents and many of these apply only to one or two industries. In many more cases the laws are so inadequately drawn as to be practically unenforceable, and in other cases the enforcement is so lax as practically to annul the act. Several of the largest industrial states having comprehensive laws have been reporting less than 2,000 accidents a year; other states of similar industrial importance report from 10,000 up.

Obviously there exists a serious lack of protection for work people. Why do not our labor laws actually give the protection for which they were intended? Many will answer at once, "Politics!" But "politics" is only a part of the answer. Others will as quickly reply, "Not enough inspectors!" And this too is only a part of the answer.

### *The First Handicap*

Take a recent occurrence in New York. Last winter two men died and one was totally blinded for life as a result of breathing the fumes of wood alcohol while varnishing vats in a brewery. The law says: "If steam, gases, vapors, dust or other impurities be generated in the course of the manufacturing process carried on therein, the room must be ventilated in such manner as to render them harmless." Note the phrase, "in the course of manufacturing process." Now, varnishing vats in a brewery is not "in the course of the manufacturing process," but comes under repair work, and therefore, the enforcing officer is powerless, legally, to require proper ventilation to carry away the poisonous fumes.

Many factory laws enumerate a certain list of dangerous conditions, machines or appliances which are to be safeguarded; but they leave unmentioned many other dangerous conditions, appliances or machines which are in as great need of safeguarding as those danger points specifically mentioned in the law. Not being specifically mentioned, the inspection officials have no authority over them. The brewery case is merely one incident which illustrates the first great handicap in the present legal safeguarding of human life.

### *The Second Handicap*

The second handicap exists in the fact that many state laws place no obligation whatever upon an employer to safeguard danger points un-

less "the commissioner so directs" or "if in the opinion of the commissioner of labor it is necessary," or "in the discretion of the commissioner of labor."

These expressions occur in sections of the present New York labor law; for instance, relating to such vital points as providing belt shifters or other mechanical contrivances for throwing belts on or off pulleys, the guarding of elevator shafts and well holes, removing dust from woodworking machinery, lighting of halls and stairways, the number of toilets, and fire-escape requirements. In all of these instances the employer is under no obligation whatever to provide safeguards until an inspector has called and ordered him to do so. For a clear impression of what an accident in shifting belts means, read cases four and six again. Official reports show that at least twenty-eight men were killed in one year in New York because of unprotected elevator or hoisting shafts and well holes.

### *The Third Handicap*

The third handicap exists in the fact that most labor laws state merely that protective requirements must be "suitable," "sufficient," "adequate," "ample," "practicable," "reasonable," "proper." Furthermore, requirements may be enforced only "when necessary," "if possible," "as far as possible," "where practicable," or "when conditions are injurious to the health of the employees." The New York law, as in many states, requires that "all vats, pans, . . . and machinery of every description shall be properly guarded."

Take the case of David Brown, a laundry worker in one of our large cities, who, while cleaning out the inner kettle of an extractor or drying machine, slipped, as he leaned over to turn off the power, and whose arm was caught in the rapidly revolving kettle and torn out at the shoulder.

David Brown sued for damages under the employers' liability law, and the jury awarded him \$2,000. But the Appellate Department reversed the award on the ground that in the industry "covers are very rarely used upon such machines," and therefore they cannot be classed as "dangerous," and furthermore, if a cover had been provided, the court held that it might not have been used to prevent the accident since the purpose of the cover is to protect clothes from dust when they are drying. Two of the five judges dissented from the majority opinion.

To rule that any machine is not dangerous because it is not customary in the industry to guard it, creates a serious situation. But a more serious situation was disclosed when the judge held that the cover might not have been put on the kettle if it had been provided. He was quite right, considering the kind of cover he had in mind; that is, one that could be put on and off by hand. And evidently the factory inspector had in mind the same kind of a cover. Neither the judge nor the inspector knew the all-important fact that the "proper" guard for such a machine is, not one put on or off by hand, but one that is so attached to the machine that it closes automatically before the machine can be put in opera-

tion. With this kind of a safeguard the workman can take no chances.

Such a device would have prevented, in the first place, the occurrence of the accident and, in the second place, had the judge or the inspector been sufficiently informed as to what constituted a "proper" safeguard, the \$2,000 award of the jury would probably not have been reversed, and the man and his family would not have been condemned to poverty.

### *Protection and the Courts*

Prosecutions for violations of the factory law, with the existing small penalties, furnish but little incentive to the employer to provide proper safeguards. It is of but little use to begin prosecutions since, where no definite standard exists, the manufacturer's word is as good as the inspector's; and comparatively few prosecutions are undertaken. In New York, for example, during the year ending September 30, 1911, only nine prosecutions were begun for failure to safeguard dangerous factory machinery. Two cases were pending at the end of the year, three were dismissed or the defendants acquitted, and four convictions were secured, one with a suspended sentence and three with fines amounting to a total of \$70.

Not long ago a workman had his right hand crushed off while at his work of removing broken paper from between steel cylinders which were revolving at a very high rate of speed. In passing upon the case, the judge said:

"The plaintiff undertook to show by the testimony of witnesses that protection was afforded in some mills by what amounted to guards in front of the calender stack. I find no evidence of guards, as guards, at all. To the contrary, the evidence relied upon disproves the practicability of so guarding this machine as to prevent the possibility of such an accident. . . . The defendant's papermaking machinery was not shown to be defective, or unusual, and the statute had no application to a case where to guard, or to cover, a portion of it, might be to interpose a serious obstruction to the conduct of the manufacturing operations."

Another case: About ten years ago a workman in New York fell through an unguarded elevator shaft and was killed. Action for damages was begun in 1904 and the courts have had the case before them continuously ever since, trying to decide whether or not the killed man knew of the danger, whether he appreciated the danger, and whether or not he assumed the risk of the danger. The case has been tried six times in the Supreme Court, five times in the Appellate Department, and once in the Court of Appeals. The case is now for the seventh time referred again to the Supreme Court.

Surely the employer or the inspector is not stirred to action by these decisions. Thus it happens that the real protective elements of our labor law, because of lack of standards, are being made up largely by individual inspectors and by the judges. We find the inspector called upon, unwisely and unjustly, to interpret and ap-

ply the indefinite provisions; we find the employer without direct responsibility and more or less inactive because he cannot know exactly what will be required of him; and the judge, without definite standards before him, becomes umpire in a citation match between the contending attorneys.

Obviously the need is for standards.

### *The Making of Standards*

The use of general terms and blanket provisions in a law has, of course, several aspects. The frequent need of elasticity in legal provisions is obvious, especially under the rapidly changing methods of manufacture in America. But what is needed is the intelligent use of elasticity. The basis for this lies in the classification of industry according to the existing degree of danger found in each class. In other words, industries and the protection they should afford the workers, should be classified and standardized according to the risks found operating in each industry.

The important problem, then, is by what method shall industries be classified, how shall practical and enforceable standards of comfort, health and safety be made, and how enforced.

### *The New Spirit*

It is in answer to this question that the new spirit in factory inspection has so definitely appeared—the spirit of co-operation and education. This spirit is already developed in at least three states: in New York, through the Joint Board of Sanitary Control operating privately in the cloak, suit and skirt industry in New York City; in Massachusetts, through the Board of Boiler Rules operating wherever boilers are used; and in Wisconsin, through the Industrial Commission, operating for practically all industries with jurisdiction over such industrial problems as unemployment and trade disputes, as well as health, safety, comfort, and moral conditions in factories.

The Joint Board of Sanitary Control is governed by representatives of employers and employes and regulates sanitary conditions in the cloak, suit and skirt industry. It is an excellent example of what can be accomplished through the co-operative spirit, but is applicable only where there is a strongly organized trade union working in a highly competitive industry.

The Massachusetts Board of Boiler Rules, organized in 1907, has been formulating and putting into actual operation standards of safety not only in the use, but also in the manufacture of boilers. It has taken a step which is likely to become a fundamental factor in accident prevention—requiring devices for safety and comfort to be included in the manufacture of machines rather than to be attached after the machine is completed and in use. The board consists of one representative of the boiler-making interests, one of the boiler-using interests, one of the insurance companies, one operating engineer, and the chief of the boiler inspection department. Rules formulated by this board must be submit-

ted to public hearings, and, after adoption, are signed by the governor; they then have the force of law.

The regulations look to the layman and the average legislator like text books in higher mathematics, but they are veritable "gold mines" to all concerned with the operation of boilers. They have been copied by many cities of the United States and have traveled even so far as Manila of the Philippine Islands.

### *The Wisconsin Industrial Commission*

The Wisconsin Industrial Commission created last year had its real beginning as early as 1908, when James D. Beck, then commissioner of labor in Wisconsin, began calling conferences of employers, employes, safety experts, insurance inspectors and staff members to consider questions of safety for a few of the most dangerous trades. The constant necessity for expert experience and for the grouping and classification of trades in order to secure effective enforcement led to the formation of the commission.

This commission is given extensive powers to make rules for the comfort, health and safety of industrial workers, but it cannot establish regulations until both employers and employes, and any other interested parties are given an opportunity, through public hearings, to make recommendations. Rules are made for each class of industries to fit the different conditions and risks of each class, and are submitted for criticism to all who are concerned or interested. Under this method the legislature lays down the general rule and the commission is given the power to secure all the facts necessary to determine and promulgate safeguards that will actually render the industry as safe as possible.

When the commission took up the question of safety and sanitation it appointed a committee on safety and sanitation standards composed of representatives of the employes, the employers, the health departments, the Employers' Mutual Liability Company, and the experts of the commission.

The committee held meetings each week, and after two months submitted a partial set of rules to the commission. The commission issued copies of these rules, held a public hearing on them, redrafted certain rules, and appointed two subcommittees of inspectors and of employers and employes from certain industries upon which the commission wished more information. All suggestions were again considered at a public hearing, and the rules revised and unanimously adopted. They were published on May 14, 1912, in an illustrated bulletin of forty-three pages. The rules became effective June 14, 1912.

As an illustration, we find that the law on belts and pulleys covers six pages and contains definite, specific directions indicating special danger points, and includes eight cuts of devices illustrating practical effective methods of safeguarding. Six pages with two illustrations are given to explaining methods of preventing accidents on elevators and shafts. Thirty pages of illustrated information for employers, inspectors and employes!

# WISCONSIN INDUSTRIAL COMMISSION

## CLASSIFIED DUTIES

The introduction to the bulletin on corn shredders is as follows:

In the year 1911 in Wisconsin 94 farmers were seriously injured on corn shredders, corn huskers and feed cutters;

4 deaths resulted;

6 arms were lost;

21 hands were lost.

This is appalling!

Not so many Americans were injured in the battles of Manila Bay and Santiago.

Not so many were injured in boiler explosions in Wisconsin in six years.

Not so many were injured in Wisconsin in powder mill explosions in ten years.

Think of the pain and suffering!

Think of the economic loss:

4 deaths .....	\$40,000
6 arms .....	42,000
21 hands .....	105,000
Other injuries .....	120,000

\$307,000

This is the record of just one year.

The stories of nineteen recent accidents as told by the injured men are then reproduced, interspersed with mottoes such as the following:

"Better careful than crippled."

"A stick is cheaper than a hand—eight men lost hands unclogging rolls."

Another bulletin deals in the same way with bakery sanitation; reports on the workmen's compensation law, and on child labor laws have been issued; and others on unemployment and on sanitation and ventilation of factories are in preparation.

Through this method of publishing and illustrating specific requirements, each employer knows exactly what is expected of him, and each inspector knows exactly what he is required to enforce. He becomes mainly an inspection official and the opportunities for dispute and hard feeling between employer and inspector are greatly reduced.

An appeal to the courts from the decisions of the commission is provided for, but complaints as to the reasonableness of the commission's orders must be brought against the commission itself in one of the superior courts. Here again another cause of disagreement and antagonism between inspector and employer is entirely eliminated.

The commission, through its utilization of the information and the skill, not only of specialists in its official employment, but also of any other person able to render service, becomes a source of real service and aid to the employer and thereby to the workers. The result is a remarkable spirit of mutual co-operation and striving toward a high ideal of industrial wellbeing.<sup>1</sup>

### Progress in Other States

Several other states are moving in this direction. Massachusetts has this year established a State Board of Labor and Industry. Illinois has had several temporary commissions which have achieved excellent results. The Factory Inspection Department of Illinois has announced the establishment of a permanent exhibit and also a special "school" where inspectors are called to

<sup>1</sup>For a fuller analysis of the powers of the Industrial Commission of Wisconsin, see the address of John R. Commons in the *American Labor Legislation Review*, Vol. 1, No. 4. 131 East 23rd Street, New York.

gether at regular intervals for interchange of ideas and for instruction from experts attached to the regular staff as well as from volunteer specialists. Minnesota carries on a special educational propaganda within its factory inspection staff, and has established a growing permanent state exhibit of practical safety devices.

The net result to be desired, however, regardless of the specific method, is the establishment of effective, enforceable standards of comfort, health and safety. A study of the methods used successfully in this country and in leading European countries suggests organization along the following lines with the specific details in each case adapted to the particular needs and conditions in each state:

### *Reorganization Principles*

#### A. Scope of the department

1. The health, comfort, safety and wellbeing of workers in all places where persons are employed (except domestic service and agriculture where mechanical power is not used) and in the construction, repair and maintenance of buildings.
2. The administration of laws for the compensation of accidents and diseases.
3. The regulation of hours of labor of all classes according to statutory law and with such discretionary power in unusual cases, as may appear reasonable after a public hearing.
4. The distribution and training of labor including the management or supervision of public and private employment offices.
5. Trade disputes, arbitration and conciliation.

#### B. The department to consist of

1. A paid advisory board or commission of not less than three members who shall have control over the general policy of the department in all matters, and who shall make rules and establish standards of health, comfort, safety and wellbeing for employes in the different industries of the state. They must hold public hearings before determining upon standards and may form subsidiary committees of employers and employes and other persons for the formulation of standards for specific industries.
2. An able, responsible chief administrative officer.
3. Specialists or experts on mechanical safety.
4. Specialists or experts on health protection.
5. An adequate staff of trained inspectors including inspectors for woman and child labor, appointed by appropriate civil service examinations.

6. A statistical bureau for the preparation, collection and publication of facts and information concerning the work and needs of the department.

C. Provision should be made for extensive educational work among employers, employes and inspectors by means of illustrated lectures and bulletins, photographs, permanent and traveling exhibits and personal work by inspectors.

D. In prosecutions, it is highly desirable that only questions of fact should be raised in the lower courts; questions of reasonableness or necessity should be appealed, first, to the board itself; then, if the complainant is not satisfied, the board should be prosecuted.

E. All employers coming under the law should be required to register at stated periods and employers conducting "dangerous trades" should be required to secure a license.

### *Economy in Administration*

Many features of this program can be easily adapted to existing systems, and some of them are already in operation in different states. The lack of adequate appropriations is frequently urged as a great hindrance to the cause of effective factory inspection. But as organized today in most states, from three to five separate departments are maintained for enforcing laws which deal with the relations of employer and employe, often with overlapping functions and duplication of work. The economy resulting from the union of these similar branches of work would go a long way toward enabling one department to be maintained on an efficient basis, and when inspection systems are so organized that more effective work is possible, the support for increased appropriations will not be lacking.

In 1909 the Association for Labor Legislation, realizing that efficient administration is the supreme test of all labor laws, began an agitation for administrative reform. Massachusetts had already in 1907 established her state Board of Boiler Rules, and has followed this year with her state Board of Labor and Industry; Wisconsin in 1910 created her Industrial Commission. In at least eight other states the need for a new basis of administration has found definite expression.

While protection from the accidents and diseases of industry has already received a marked impetus, especially among some of the larger employers, yet considerable "policing" will always be necessary to bring the backward employer up to the level of the more humane. There exists, however, especially where workmen's compensation acts are in force, an increasing group eager to learn, and the state which ultimately holds them responsible should not offer as its part of the duty a hollow pretense.

The business of factory inspection should never be based upon fear, force and favor. It must become to a greater degree a co-operative educational effort on the part of the employer, the employe and the state.

# THE PENSION PLAN FOR THE BREWING INDUSTRY

I. M. RUBINOW

*"Timeo Danaos et dona ferentes."*

The appearance of a strong and healthy movement toward social insurance in this country has been a source of great satisfaction to all who believe in social legislation. Only three or four years old, this movement has as yet been limited primarily to insurance against industrial accidents. But here and there one finds the first traces of an extension to other causes of poverty, such as old age and unemployment. For this reason the news of the proposed organization of a pension fund for the brewing industry has received a hearty welcome from *THE SURVEY*<sup>1</sup> as well as other publications.

While pension funds organized by individual corporations, such as railroads or the United States Steel Corporation, have been known before, the brewers' plan was doubly interesting because it proposed a type of organization hitherto unknown in the United States, though not unfamiliar in Europe—a pension fund organized by many employees of one industry working together. This type has one essential advantage over the pension fund of an individual corporation—it does not interfere with the mobility of labor within the industry.

The praise bestowed upon this experiment was almost extravagant. *THE SURVEY* review spoke of it as a constructive program for the improvement of conditions of labor, which was revolutionary. The author expected the plan to "make for greater harmony and mutual good feeling in the industry."

The fact that this plan was rejected by an overwhelming majority of the membership of the International Brewery Workmen's Union, to whom it was submitted for a referendum, attracted much less attention. It was considered as one of those evidences of social strife which it does no good to underscore. The truth of the matter is that of 35,824 votes cast, only 12,888, or 36 per cent, were in favor of the plan, and 22,936, or 64 per cent, against it. The verdict, unmistakable as it appears to be, came as a distinct surprise to the employers who were favoring it.

The actuary of the plan, Edward Bunnell Phelps, in discussing this verdict at great length in his magazine, the *American Underwriter*,<sup>2</sup> chose the following picturesque title for his article, American Brewery-Workers' Surprising Rejection of Their Preferred Workmen's Compensation and Old-age Pensions—A Clean-cut Case of the "Consciousness of Kind," and quotes extensively from Prof. Franklin H. Giddings' famous work on Principles of Sociology,<sup>3</sup> as containing the only rational and complete explanation of the "amazing vote." On another page Mr. Phelps further mentions "the predominance of the German race in the ranks of brew-

ery-workers, the pronounced Socialistic leanings of that race, and the honest but misguided suspicion of a considerable proportion of the labor element, the world around, that all moves of capital are necessarily bad and selfish moves."

One cannot help feeling that the phrase Mr. Phelps was groping for is rather "class consciousness," and the key to the situation may be found in Marx rather than Giddings, though to be sure, "class consciousness" may be looked upon as one of the many manifestations of Professor Giddings' principle of "consciousness of kind."

The facts themselves, as already related, would justify a careful study of the brewers' pension plan, even though it might appear, in view of the decisive vote of the Brewers' Union, to be a matter of mere historical and theoretical interest. At the last convention of the International Union, however, it was decided to re-submit the proposal through another referendum. The problem thus again becomes one of tremendous practical importance, as the plan, if accepted by the union, would cover some 40,000 employees, and is therefore almost as wide in its application as a compensation act in one of the smaller states.

The subject of private and industrial compensation schemes as against statutory compensation acts, of industrial pension schemes against governmental pension and compulsory insurance laws, is a broad and complicated one. It is not the intention of the writer to launch here upon an exhaustive discussion of the basic principles of social insurance. His purpose for the present is a very practical one. Here is a proposal submitted for the second time to a large body of wage-workers as a desirable solution of certain economic problems they are forced to face. It bears the approval of the employers; it has been O K'd by an actuary; it is recommended in good faith by people sincerely desirous of their good. It has, therefore, a fair chance to become a fact, for even rabid "class consciousness" often yields to arguments of economic advantage. Yet it is quite clear that both the employers and the sympathetic outsiders judge the plan almost exclusively by its general intent, and that in actual application the worth of every such scheme depends much more upon its detailed provisions. It is only because of his deep conviction that these detailed provisions are not what they should be, that they threaten to affect the interests of the 40,000 wage workers very unjustly that the writer makes this criticism of the plan before the harm is done.

The fund proposed is built upon a mutual contributory plan, i. e., both employers and employees contribute certain amounts. The exact proportions are: Three-fourths of the total amount (1½ per cent) from the employers, and one-fourth (½ per cent) from the employees. As far as old age insurance is concerned, this is a plan sanctioned by many European precedents, both in

<sup>1</sup>See *THE SURVEY* for January 20, 1912.

<sup>2</sup>See the *American Underwriter*, April, 1912, p. 122.

<sup>3</sup>Principles of Sociology by Franklin H. Giddings. The Macmillan Co.

national systems of compulsory old-age insurance (Germany, France), and in many industrial funds. It may be said in its favor that through such mutual contributions more liberal provision may be made for old age than if only one side contributes.

But the brewers' plan is much more than an old-age pension fund. It includes accident compensation as well. Yet almost all European precedents are against forcing the cost of accident compensation back upon the workers. It is the basic principle of accident compensation that its cost must be borne by the industry as a whole, and, with very few exceptions, all the fifteen American compensation acts thus far passed have accepted this principle. As the fund assumes the granting of compensation for industrial accidents, and as the employee contributes only three-fourths to the fund, it is evidently an effort to place upon the employee a certain part of this cost, unless it be assumed that only the employers' contributions are to apply to accident indemnity; then it follows that the employer contributes nothing to the pension feature.

There may be an argument in favor of a contributory accident compensation scheme, if no compensation act has as yet been passed. But such acts have been passed and are in force in at least a dozen states. Why should the workman be called upon to pay part of the cost of compensation, where the law guarantees him such compensation entirely free.

Article II, Section 2, provides that "the acceptance of benefits under this plan shall be in complete waiver of all (other) remedies . . . under common or statute law." It is very questionable whether this provision would be recognized as legal when a compensation law exists which is more favorable than the scheme provided. It is true that by Section 3 the employee, if injured, is given the right to decide whether he wishes to accept the compensation from the fund or prefers to sue his employer under the existing liability or compensation laws. Very well. The injured employee may feel that under the legislation existing in the state he may obtain a larger verdict. What happens then? Observe how differently the employer and employee are treated in such an emergency.

If the injured employee demands his rights "under the common law" or "statutory remedy," i. e., under the existing liability or compensation legislation, and if he is successful and obtains a verdict against his employer, very much in excess of what the fund was willing to pay, the employer need not be worried at all. In such a case the fund reimburses the employer for any amount paid on that verdict (Article II, Section 5). In other words, the fund guarantees the employer full insurance against employers' liability and workmen's compensation. For this the employer pays only \$1.50 on every \$100 of wages expended, while a casualty company would charge him \$2 or \$3. The arrangement is profitable from the employer's point of view, no doubt.

But, on the other hand, what happens to the employee who, after receiving a serious injury, has chosen to take advantage of his rights under

the laws of the state? He loses all his accumulated rights even under the pension plan. For it is provided (Article III, Section 2) that old-age pensions shall be granted only to such employees who "have in every case accepted the provisions of this fund in preference to statutory or common law remedy." Under this provision a workman may, after twenty or thirty years of membership and contributions to the funds, lose his accumulated rights for a pension because he has taken advantage of his legal rights and sued his employer for damages for injury sustained.

Thus the compensation plan is made practically compulsory. How does it compare with the compensation given under some of the laws recently passed? A weekly indemnity of 65 per cent of the wages is provided; an equal amount is given in two states, while others grant 50 per cent only. Singularly enough, only "total disability" is mentioned. One is loath to assume that there was a deliberate intent not to grant any compensation in the much more frequent cases of partial disability, though a literal interpretation of the by-laws would justify such a conclusion. A more charitable assumption would be that lack of familiarity with the nature of industrial accidents is responsible for this omission. It is quite clear, however, that only "first aid, medical and surgical," is provided, while many of the state compensation acts already adopted grant full medical aid for a certain length of time.

In one respect, the compensation scale appears to be rather liberal. The weekly compensation of 65 per cent of the wages may rise to \$20 a week, while in most state laws the maximum is placed at \$10 or \$12 a week. This generosity will affect only a few, whose wages are from \$20 to \$30 a week. But the generosity is a very illusory one. For an ironclad maximum of \$3,400 is placed both for permanent disability and for death. That means that the larger the weekly allowance, the sooner will it stop. In case the maximum allowance of \$20 is granted, it will last only 170 weeks, while even under the highly unsatisfactory scales of the acts passed up to this time, 300 or 400 weekly payments are usually provided for. Besides the maximum established (\$3,400) is smaller than that found in the act of Illinois (\$3,500), Kansas (\$3,600), or California (\$5,000). So much for accident compensation.

There is no doubt that the fund is very liberal in treating the superannuated employee. After twenty-five years of service, and having either become incapacitated or reached the age of sixty (in which case no evidence of disability is required), every employee may retire on a pension to continue the remainder of his life, amounting to one-half his weekly wages. A more liberal provision for old age could hardly be wished. But—there are several important "buts."

Suppose the employee is forced to leave his employment in the brewing business before twenty-five years of service have been completed? It may reasonably be assumed that an expert beer brewer will remain in the business for life. But not all of the employees in the brewery business are expert brewers. A good many are unskilled

laborers, drivers, machinists, etc., who may be forced by fluctuations in the demand for labor to seek other occupations. Is there any provision for such employees, to protect their rights if they have been shifted into other lines of industry? None whatsoever.

To be sure, this is a situation which no industrial pension fund can remedy altogether. Only a national policy of social insurance can meet this criticism, and there is in this difficulty an argument for such a national system, which no amount of benevolence on the part of the employers or of co-operation between employers and employees can meet. Nevertheless, it is obvious that in some way the interests of such workmen who may be forced to make the change may and must be protected, and all similar funds in Europe, with hardly any exceptions, contain various provisions to that effect. If twenty-five years of service justify a pension of half the wages, is twenty-four years worth nothing? A limit must be set, to be sure, but there is nothing to prevent the limit from being on a sliding scale, —so much for fifteen years of service, so much for twenty, and up to the full pension for twenty-five years. And if the length of the service was only very brief, then the workman has really had no old-age insurance, and the amount which he has contributed must be returned to him.

Again, it is one thing to promise a liberal pension, and another to be in a position to pay it. Suppose the money available in the fund is insufficient? The by-laws evidently foresee such a possibility, for Article III, Section 8, provides that immediately after the first year the Board of Directors must determine whether the compensation and old-age pensions promised may be safely paid, and if not, the amounts of either shall be reduced. There is no suggestion that the employers' contribution may be increased.

Suppose, furthermore (a situation which later will be shown to be inevitable), the fund proves insolvent and must be discontinued? Article VI, Section 4 (the last section of the by-laws), has foreseen even this emergency. Under such a condition "all claims by any past or prospective beneficiary or claimant shall cease and be at an end." That means that the injured and their families will cease receiving their compensation, after they have signed away all their rights under the law. By that the hopes of old-age pensions would be shattered into splinters for thousands of wage workers, perhaps after years of contributions.

The reader may rest assured that this is no deliberate painting of gruesome impossibilities, but the inevitable wind-up of this "benevolent scheme," for the simple reason that the amount of contributions collected (2 per cent of the wages) would be ludicrously inadequate to meet the cost of the pensions so lavishly promised, even if it were not intended to cover the cost of compensation as well. It is impossible to enter here into an involved actuarial argument of the proper cost of the pensions promised. But even a tyro in the theory of insurance will perceive the weak link in the chain of argument which was used to supply the rate. It was argued by

the actuary that since (according to a special investigation made by him)  $2\frac{1}{4}$  per cent of the employees in the brewing industry were men sixty years or over,<sup>1</sup> this represented the true proportion of pensioners to be expected. The palpable fact was forgotten that the number of old men within the industry is kept down by "firing" the superannuated, and that if all the men over sixty could be found who have been in the brewing industry, their number would be very much larger. Without quoting here statistical data, we may say that the experience of European pension funds has shown a constantly rising percentage of pensioners to employees. This, in the French railroad pension funds, for instance, has reached 20 per cent, notwithstanding the large increase in the number of active employees, which of itself would tend to keep the percentage of pensioners down. And the experience of European pension funds has shown that to pay a pension of half the wages at the age of sixty would require contributions up to 10 per cent of the wages. In short, the brewers' fund was devised with a disregard of actuarial conditions which would probably lead to insolvency in five years, or ten at the latest. And perhaps this inevitably rapid dissolution of the pension fund is its one redeeming feature, for the longer a fund exists which is not based upon correct actuarial principles, the more rights are accumulated which eventually must be forfeited.

Now, to sum up my criticisms in a few specific statements as to what should and what should not be in a compensation plan, my point of view is simply this: First, accident insurance must not be combined together with old-age insurance in one financial plan, so that heavy losses of one part of the insurance should not jeopardize the financial strength of the other part. Second, accident compensation should be given entirely at the cost of the employers. Contributions from employees are absolutely unjustifiable. Third, mutual accident compensation funds are feasible and desirable, provided they can be made financially sound by establishing liability of the employers in that fund for its solvency, and provided they are under proper state supervision. Fourth, under no circumstances should a mutual accident compensation fund grant a scale of compensation which is lower than that required by the law. It may give more, but it cannot give less. Moreover, that is the condition required by most laws, and if the scheme gives less, the acceptance of that smaller amount of compensation should not be and usually is not binding upon the employees. Fifth, surely under no circumstances should the failure of such a plan deprive their workmen of any accumulated rights. So much for the accident compensation scheme.

As to the old-age pension plan, my criticism mainly is based upon its apparent insolvency. I cannot conceive of any actuary believing that what remains of 2 per cent of the wages, after

<sup>1</sup>The census of 1900 shows that out of 20,984 brewers and maltsters, 422, or 2 per cent, were sixty-five years old or over; 1,278, or 6 per cent, were fifty-five to sixty-four years old. On an assumption that there were twice as many persons fifty-five to fifty-nine than sixty to sixty-four years old, it still follows that there were 4 per cent of persons sixty-four or over.

all accidents have been provided for would be sufficient to pay the liberal pensions promised. While it is true that we have no definite information as to mortality in the industry and the possible number of old-age pensioners, it is quite evident that the basis assumed, that is, the number of persons over sixty remaining in the industry, is not sufficient to judge of the number of persons over that age surviving, for, undoubtedly, a large number of persons surviving did not remain in the industry.

It is not assumed for a moment that the 22,000 members of the brewers' union, or even any con-

siderable number of them, were able to see through all these faults of construction of the scheme proposed. But if this "class consciousness" or "consciousness of kind," if you will, has moved them to reject it "on suspicion," the verdict appears to have been fully justified. Whatever one may think of this form of "mass consciousness" as a guide to mass action, its usefulness in this one case cannot be denied. The revival of the effort to gain the workmen's approval to this scheme should be resisted by all who have the true interests of 40,000 wage workers' families at heart.

## A REPLY TO MR. RUBINOW

HUGH F. FOX

SECRETARY UNITED STATES BREWERS' ASSOCIATION

Mr. Rubinow's criticism of the proposed old-age pension plan would have more weight if, as he unjustly infers, this was intended to be a final arrangement. It is clearly provided and stated that it is tentative and experimental, and the plan is so elastic that it can be adjusted in accordance with the experience gained under its operation. At present neither the insurance companies nor the brewery workers' unions have the facts upon which an actuary could base his conclusions with regard to the mortality in the industry, and the percentage of men who might qualify as old-age pensioners.

The proposed plan was submitted by the International Brewery Workmen's Union to their attorneys, and was referred on our side to several insurance experts and attorneys, and was discussed in detail, line upon line, by a joint committee of the employers and employes, and all of the objections most carefully considered. We are of the opinion that in some respects it may have to be modified, and in others it may be greatly extended, after the experience of a year or two. This has been carefully provided for.

Mr. Rubinow is concerned about the loss of forfeiture which the employe may suffer if he were to quit the brewing industry, and we are frank to say that this is a point that deserves consideration. At the same time, it should be remembered that the cost of the insurance for accidents and old-age pension to the average brewery worker would not amount to over \$5 a year or less than ten cents a week, which is not sufficiently serious to be a hardship, even if eventually he dropped out of the industry.

It is evident that Mr. Rubinow has very little knowledge of the brewing business in assuming that there will be a constant shifting of brewery workers into other lines of industry. As a matter of fact, the brewing industry offers rather peculiar advantages. It is a continuous industry, it pays exceptionally high wages, it is a non-hazardous industry, and it not only grows automatically with the population, but expands with the growth of our cities and towns and with the development of transportation facilities. In short, there is probably no industry that shows

so little fluctuation in the demand for labor as the brewing industry.

The discussion in regard to compensation for accidents in the brewing industry has been going on for fully two years and while the negotiations between the brewers and their men were still pending, several states passed laws making provision for compensation for all industrial accidents. We sincerely hope that such action will soon become so general in the United States that it will not be necessary for the people engaged in any particular industry to provide their own insurance, in order to get a more just and equitable arrangement than can be obtained through any of the casualty insurance companies.

Our proposed provision that "the acceptance of benefits under this plan shall be in complete waiver to all other remedies under common or statute law," with the qualifying clause in Section 3, that the beneficiary has eight days after an accident in which to choose between the fund and the legal remedy, was put in as a matter of ordinary business precaution. I can hardly believe that any sane insurance man or lawyer would endorse any accident plan giving the employe the opportunity to first accept the liberal benefits automatically provided, and then sue for additional compensation on the basis of his common law or statutory rights.

Mr. Rubinow's assumption that the plan only provides for compensation in case of total disability is in our judgment entirely unwarranted and perhaps I may say that although the plan was submitted to several experts in this field of activity and to a number of attorneys who have studied the subject, it did not occur to any of them to reach such a conclusion.

Mr. Rubinow is acting entirely upon assumption and without any knowledge of conditions in the brewing industry, when he states: "The palpable fact was forgotten that the number of old men within the industry is kept down by firing the superannuated, and that if all the men over sixty could be found who have been in the brewing industry, their number would be very much larger." It has been the general custom

of the American brewers to retain their old employes, even though they cannot do efficient work. One of the motives which actuated the brewers in the proposed pension plan is that it will enable them to take kindly care of such men and replace them with young and active workers. In computing the probable cost of the plan we have taken the actual experience of the American brewing industry itself, as the basis of calculation, rather than "the experience of European pension funds." The present average age status of the men employed is certainly a safe basis to go on, since this average will be very much reduced in the course of a short time under the operation of a pension plan. However, the discussion of the whole matter is at present somewhat premature since it is hardly likely that the employing brewers would consent to reopen negotiations until the Brewery Workmen's Unions have completely reversed themselves and take the initiative in urging the reconsideration of the plan by something like a two-thirds vote of their members.

I do not see the point of his criticism of the indemnification of employers, in case of claims made by those who elect to take their common law or statutory remedy in preference to the

benefits of the fund. Unless such a plan provides adequate insurance for the employer, he would be foolish to go into it.

Mr. Rubinow's query as to how the proposed plan compares with the compensation given under some of the laws recently passed, has already been answered in the Detailed Comparison of Recently Enacted Employers' Liability and Workmen's Compensation Laws of the United States, published only two months ago by the Aetna Life Insurance Company. Reference to this will show Mr. Rubinow that California and Wisconsin provide for 65 per cent of wages for disability, which is the measure of our plan, and Ohio provides for 66 2/3 per cent. All other states that have passed workmen's compensation laws provide for a smaller sum. Arizona, California, Illinois and Kansas fix a maximum death benefit higher than the benefit provided for in our plan, but Section 8, Article 3 of our plan provides that the benefits may be increased from year to year if the results of the operation of the fund justify it.

Mr. Rubinow's motto, "*Timeo Danaos et dona ferentes*," at the head of his article, discloses at the outset an attitude of prejudiced hostility that colors his entire statement and indicates that his criticism was not intended to have any constructive value.

## A TALE OF TWO CITIES AND A LOAF OF BREAD

Unsanitary cellar bakeries in Chicago have received a body blow from the Supreme Court of Illinois. In 1907 an ordinance was passed in Chicago establishing standards for bakeries that if enforced would have meant the end of most of the bakeshops below the street level. And to make supervision possible, it required bakers to take out a license issued by the commissioner of health and revocable by the mayor. A municipal court declared the ordinance invalid, but now the supreme court, having the case before it on an appeal, has upheld the ordinance at every point. That means that the work begun in 1907, when there were only 750 bakeries above ground, and carried on until there were 1,300 above ground and only 244 in cellars, will now go on to its logical conclusion.

It is unfortunate that this story of progress in the second city of the United States cannot be told also of the first city. Dr. George M. Price, who made a report on bakeries for the Factory Investigating Commission, found that most of the 2,489 bakeries in Greater New York are in cellars. He made an inspection of 485, and of these 479 were underground. And there is no law designed to bring them out.

In all the cellars investigated, the ceilings were found to be very low, the average height being about 7½ feet. The lack of dressing rooms and decent washing facilities and toilet accommodations prevailed almost everywhere. In most cases there was an insufficient supply of hot water, so that not only is it practically impossible for the workman to keep his hands clean, but proper cleansing of the utensils is out of the question.

As a consequence, the bakery products are not properly handled, very little effort is made to keep them clean and the danger of disseminating disease in this manner is increased many fold. Mice are attracted in large numbers, both on account of the location of the bakeries and on account of the flour and meal which is kept in them. Therefore it is quite generally considered necessary to keep a cat, which is another source of great danger as regards cleanliness of the product.

The report goes into a discussion of the characteristics of workmen employed in bakeries and into general conditions affecting health. As a rule, bakery workers are of a very low and unintelligent class, poor in physique and inclined to alcoholic and other excesses. "Undoubtedly," says the report, "this is due to the unsatisfactory conditions which are known to exist in the trade and which deter a better class of artisans from entering."

Conditions directly affecting the health of the workers include, besides the high temperature, three other very important elements. First, is the low scale of wages prevalent in the industry. Since 1894, when the commissioner of labor made an investigation of bakeshops, wages have advanced considerably, owing to the successful efforts of the bakers' union, but the rate for union bakers at the present time does not average above \$14 a week, and among the unorganized workers wages are lower. A second factor entering into the situation is the long hours of labor. The union shops have a ten-hour day, but in the non-union shops the day's work is never

less than twelve hours, and often is very much longer than that. It should be pointed out in this connection that there are a great many non-union shops in New York, and that these include most of the larger bakeries.

"It seems obvious," says the report, "that even in trades where conditions are exceptionally good and hygienic, extremely long hours of labor would act injuriously upon the health of the workers, and hence lower the vitality of the nation and the race. This is doubly true in an industry where, as we have seen, all other conditions of work are so unfavorable." A third factor of importance is night work, and it is pointed out that the unnatural manner of living necessarily resulting from working at night has a serious reaction upon the general health.

The report demonstrates in most striking manner the truth of its statements that the conditions described are unhygienic and dangerous alike to workers and the general public. A physical examination was made of 800 bakers by a staff of six physicians under the immediate direction of Dr. Price. It was found that 347, or 43 per cent. were free from any disease, while 453, or 57 per cent. "had some indication of defective physical condition."

The diseases found were in part as follows: Nineteen had evidences of tuberculosis, forty-seven were suffering from rheumatism, three from venereal diseases, ninety-two from eye troubles, ninety-five from diseases of the circulatory system, 206 from diseases of the respiratory system, seventy-six had digestive troubles, fifty-nine had skin diseases and fifty-four had flat feet. In addition to these, 183 had a general appearance such as to indicate anæmia.

A CELLAR BAKERY IN NEW YORK

#### THE EIGHT-HOUR DAY AND A MAN OF LAW

For many years an eight-hour law to apply to contracts let by the government has been earnestly sought at Washington. During session after session evidence has been placed before Congress tending to show the evil effects of long hours of labor. It finally remained for the report of the Bureau of Labor on the steel industry to furnish the convincing argument. Senator Borah, in favorably reporting the eight-hour bill, quoted extensively from this document to

prove the necessity of establishing a maximum period of daily labor.

After all this the attorney general of the United States, in an opinion recently handed down, thinks it was all meant to protect not the workmen who build ships but the material that goes into them from being worked on too long. He holds that a private shipyard, which has a government contract, may require its men to continue at work after eight hours, provided it applies their labor for the excess time to private contracts. The decision may be an excellent interpretation of the letter of the law but it is complete inversion of its spirit and defeats the purpose of its framers.

Think of the quivering wreck a fragile dreadnought might be if it had to endure the torture of having its insides riveted all through a ten or twelve-hour day! Or imagine the feelings of a delicate slab of armor plate after being pressed and pounded and variously abused for twelve hours at a stretch! Such atrocities will be stopped by the attorney general's ruling.

#### EFFICIENCY IN SETTLING INDUSTRIAL DISPUTES

The topic for discussion by the Efficiency Society at its monthly dinner at the Aldine Club in New York on November 29 was the relation between employer and employe. The Protocol of Peace that has proven so successful in the cloak and suit industry in New York was explained and described as a long step toward permanent industrial peace founded on just regard to the claims of all parties, including those of the public.

H. F. J. Porter, who presided, described the chaotic conditions which had existed in the cloak and suit industry prior to this settlement. He referred to the alternate periods of activity and idleness that had prevailed, and declared that a condition had existed every two and a half to three months such as would be the case if the entire population of the city of Providence or Indianapolis should suddenly be dumped, without means of support, into the city of New York. The manner in which disputes are now settled in this industry was described by Hamilton Holt, editor of the *Independent* and one of the three members of the Board of Arbitration, and by Julius Henry Cohen, attorney for the manufacturers.

The working of the Joint Board of Sanitary Control was described by its chairman, William Jay Schieffelin. By way of contrast with this plan for industrial peace, where the public joins in the settlement of disputes and where the preferential union shop obtains, addresses were made by a representative of the New York builders, where the closed shop is recognized and an arbitration agreement was enforced for many years, and by a representative of the Metal Trades Association, whose members do not recognize the union in any form.

Charles Stelzle then spoke of the point of view of the members of craft unions, and Samuel

Stodel, a Socialist, explained to the diners the philosophy underlying the movement of the Industrial Workers of the World.

#### SAFETY IN WASHINGTON

The Industrial Insurance Commission of Washington, after ten months' experience with not far from 10,000 industrial accidents, "very many many of them preventable," has decided to follow the lead of Minnesota, Illinois and Wisconsin, and enter on a campaign of education in safety. Washington aims to "broaden and strengthen the safeguarding and inspection laws; to further the patient and persistent work of the State Bureau of Labor, and, so far as competitive conditions in other states permit, to standardize dangerous machinery and obsolete equipment and to penalize poor and careless management." Last month the commission issued general instructions to workmen and a placard on safety publications to be posted in factories.

The Wisconsin Industrial Commission has its safety work more fully under way. In addition to an excellent series of safety bulletins it has three safety exhibits, two of which tour the state, the other being located permanently in Milwaukee.

#### FACTORY BOYS SENT TO SCHOOL

Twelve of the biggest factories of Hartford, Conn., have joined hands with the public high school to carry out a co-operative plan of industrial education. The scheme is expected to prove an important and permanent addition to the curriculum of the high school. The firms co-operating with the school authorities are the following: Underwood Typewriter Company, Royal Typewriter Company, Johns Pratt Company, Sterling Manufacturing Company, Henry and Wright Company, L. E. Rhoades, Taylor & Fenn, Sigourney Tool Company, Veeder Manufacturing Company, Topping Brothers, Hartford Rubber Works Company, and the Pratt and Whitney Company.

The manufacturers as yet have sent only their brightest boys. Although the number selected from each factory is small and the boys are but beginning to find themselves, the mill superintendents express satisfaction with the results. "The boys seem to be taking a greater pride in their work," declares one, "and their activity seems to have an excellent effect upon the rest."

The boys sent from the shops are studying at the high school in three divisions, each section putting in two and one-half days a week over their desks or in the school machine shop. The greatest difficulty experienced is in adjusting the work to make it equally efficient for all the boys. Some have never graduated from a grammar school while one has completed part of a college course. Only a few pupils have been enrolled, as a good deal of individual work is necessary in carrying out the objects of the plan.

<sup>1</sup>See THE SURVEY for September 28, 1912, p. 796.

## RAYMOND ROBINS VISITS PITTSBURGH

Efforts to secure the assurance of union wages and an eight-hour day on all city contracts in Pittsburgh resulted in a stand-up fight between manufacturers and labor leaders, in which Raymond Robins of Chicago figured prominently. Late in October, an ordinance was introduced and affirmatively recommended by a committee of Pittsburgh Council, providing the same rules for wages and hours that have been in force in school contracts since Pittsburgh's new school code went into effect in 1911.

Council weakened when confronted by the protests of contractors and manufacturers and the possible bidders won the final victory. The ordinance did not demand the exclusive employment of union men and was intended to apply only to construction work and not to supplies, but many printers and like employers were active in opposing the measure.

Raymond Robins, although invited as a representative of the Central Trades Council and the Iron City Trades Council, was not permitted to speak by Robert M. Garland, chairman of the finance committee when it held the final public hearing on the ordinance, November 7. Mr. Garland, who is president of a steel products corporation and originally from County Ulster, Ireland, waved the banner, "Pittsburgh for Pittsburghers," and issued a warning that advice from residents of any other cities was not acceptable.

Mr. Robins had made his position on the ordinance clear at the afternoon meeting of the Chamber of Commerce, of which Mr. Garland is vice-president. As was expected, the chamber adopted resolutions opposing the hours and wages ordinance.

Defeat of this important ordinance served, at least, to align the nine men of "Pittsburgh's Business Men's Council" into two groups, in which the interests of labor were reflected by three members, Messrs. Kerr, McArdle and Rauh.

Smarting under the treatment accorded Mr. Robins, Councilman McArdle, former president of the Amalgamated Association of Iron and Steel Workers, the following week presented a resolution providing that thereafter parties interested in any ordinance should have a right to have their selected representatives heard. The resolution met defeat 6 to 3.

## BULLETINS

Following its elaborate report on workmen's compensation, published in 1909, the United States Bureau of Labor has issued three bulletins in a series on Workmen's Insurance and Compensation. These bulletins (Numbers 101, 102 and 103 of the Bureau of Labor) cover The Care of Tuberculosis Wage-earners in Germany, the text of the British National Insurance Act, and of the Sick and Accident Insurance Law of Switzerland.

The department has discontinued the publication of Annual and Special Reports, and in place of the bimonthly bulletin is issuing at irregular intervals bulletins on special subjects.

## MINE ACCIDENTS IN 1912

With Technical Paper 27, the Federal Bureau of Mines issues its first monthly statement of mine accidents in the United States. Future issues will cover simply a report of the number and causes of accidents during the month, with short descriptions of major mine disasters. This first report, however, gives total accidents for all states with mining inspection departments, except Kentucky, for the first eight months of 1912. These figures show 1,453 men killed during that period, and indicate that unless there are a number of exceptional disasters in the remaining four months of the year, there will be a substantial decrease over 1911 when 2,719 men were killed, or 1910, when no less than 2,840 met their death.

## INDUSTRIAL MEDIATION LAWS

Within the last month the National Civic Federation has organized a national department on industrial mediation laws, with Marcus M. Marks as chairman. The department is the outgrowth of the twelve years' experience of the federation's voluntary conciliation department.

## MAIMED WAGE-EARNERS

The Social Service Bureau of Bellevue Hospital, New York, has displayed for sale the needle and crochet work of two girls, whose records spoke volumes, on the one hand, of the havoc wrought by industry on young bodies; on the other, of the remarkable way in which handicaps can be surmounted. Both girls earned their living by handwork—and yet the records on the cards read:

"May S.—20 years old. Both hands injured in a laundry. Right amputated. Learned to embroider in the school for crippled children"

"Adelaide G.—15 years old. Hand became entangled in the clothes in a laundry washing-machine (work, it may be noted, which is generally done by men). Fingers on right hand amputated."

## "THE WAR AGAINST WAR"

The French General Confederation of Labor, with a membership of union men not larger than the American Federation of Labor, but an influence which extends throughout the whole unorganized working class of France, has anticipated action by the International Socialist Congress described in THE SURVEY of December 14. On December 16, the confederation called a twenty-four hour protest strike against the militarist spirit aroused in France by the Balkan War. The order promulgated by the federation reads in part:

"Only by the complete cessation of the means of production and locomotion and of work of all kinds can labor strikingly demonstrate its firm determination to refuse all co-operation in warfare, which work of death is contrary to the ideas of progress and humanity."

# CHURCH AND COMMUNITY

Edited by GRAHAM TAYLOR

## THE CO-OPERATIVE FEDERATION OF PROTESTANT CHURCHES

In the great hall of Chicago's newest hotel, bearing the name of La Salle, the Jesuit-trained pioneer explorer who led the way of empire westward to the Great Lakes and the Mississippi, the Protestant churches of America have just held their second "ecumenical council." This world term, used by the early church to describe those great historic councils representing every form of the common faith in every land on all the earth, deserves to be applied to this second Quadrennial Meeting of the Federal Council of the Churches of Christ in America.

The "National Conference of Charities and Correction" came nearer being "ecumenical" than any affiliated body of people sharing and serving a community of interests race-wide and as broad as the world. For it has always included in its great co-operative fellowship Jewish, Roman Catholic and Protestant representatives of wide organized efforts toward a common aim, together with many more who share their humanitarian spirit without holding allegiance to their religious tenets and organizations. This conference of the charities has not yet been superseded by any council of the churches in the inclusiveness of a membership representing all faiths within the bond of a common spirit and purpose.

But within the Protestant world there is nothing so "ecumenical" as this Federal Council. The 339 delegates, officially commissioned to represent twenty-eight of the thirty-two federated denominations, actually represented Christian bodies scattered all over the world and constituted by peoples of many races and languages. While they may seem to be a small proportion of the 184 Protestant bodies reported by the United States census for the year 1906, yet they include all the larger, well established and influential denominations, having in their memberships at least 17,000,000 of the 33,000,000 Protestant communicants enumerated in the census. To have federated so large a proportion of churches and communicants in the short space of four years since the first council convened at Philadelphia is surely a great achievement in social and religious unification.

The caution and conservatism shown by the high courts of ecclesiastical authority in choosing the delegates to represent their respective bodies were marked in the constituency of the council. Of its 339 members 309 were clergymen, only thirty were laymen, and only two were women. It was largely a body of officials, among whom were forty-three secretaries, twenty-nine bishops, four missionaries, fifty-eight presidents and professors from educational institutions, sixteen editors and 151 pastors. Forceful and capable as was the personnel of the council, it would have been more representative, and perhaps more practically effective, had there been a representation of men and women from the laity more commensurate with their numerical and influential proportions in the constituent bodies. The Society of Friends had the distinction of being represented by the two women delegates. The Commission of Social Service previously led the way for the appointment of women delegates by requesting the appointment of women upon the commission.

To those who test this federation by their aspirations for the organic unity of the churches, little advance toward that goal will seem to have

## DECLARATION OF SOCIAL FAITH

By the

Federal Council of Churches of Christ in America  
Quadrennial Meeting, Chicago, December, 1912

The churches must stand:

1. For equal rights and complete justice for all men in all stations of life.
2. For the protection of the family, by the single standard of purity, uniform divorce laws, proper regulation of marriage, and proper housing.
3. For the fullest possible development for every child, especially by the provision of proper education and recreation.
4. For the abolition of child labor.
5. For such regulation of the conditions of toil for women as shall safeguard the physical and moral health of the community.
6. For the abatement and prevention of poverty.
7. For the protection of the individual and society from the social, economic, and moral waste of the liquor traffic.
8. For the conservation of health.
9. For the protection of the worker from dangerous machinery, occupational diseases, and mortality.
10. For the right of all men to the opportunity for self-maintenance, for safeguarding this right against encroachments of every kind, and for the protection of workers from the hardships of enforced unemployment.
11. For suitable provision for the old age of the workers, and for those incapacitated by injury.
12. For the right of employes and employers alike to organize and for adequate means of conciliation and arbitration in industrial disputes.
13. For a release from employment one day in seven.
14. For the gradual and reasonable reduction of the hours of labor to the lowest practicable point, and for that degree of leisure for all which is a condition of the highest human life.
15. For a living wage as a minimum in every industry, and for the highest wage that each industry can afford.
16. For a new emphasis of Christian principles to the acquisition and use of property and for the most equitable division of the product of industry that can ultimately be devised.

been made. But organic unity is not and never has been the aspiration of those constituting this federation. Indeed, time and again it was claimed to be a distinct advance to have reached an attitude of entire respect for and toleration of each other's differences, to have attained a common ground on which, without any sacrifice of conscientious conviction or waste of the hard-won results of historic heritages, these large, well-established and growing bodies of Christian people can federate to co-operate. And it was further claimed to be the greatest gain that this basis for co-operative unity had been reached not by minimizing differing tenets and polity to the lowest terms in an attempt to reach colorless uniformities upon which there could be no disagreement, but by magnifying the spirit and loyalty which all held who own allegiance to the one supreme Leader and Lord. As a matter of fact neither the observer from the outside nor those within the inner circle of the council could detect any breach in this bond of union, or even any "tender-foot" attitude begotten by the consciousness of any armed truce or by the fear of divisiveness. The only approach to this feeling, singularly enough, was shown, not at any point of possible sectarian attrition, but by a northern clergyman who feared that a quotation of Lincoln's temperance sentiment might raise objections from the South. Southerners, however, were quick to disavow any such feeling, and the supersensitiveness lest brethren should be offended was quickly shown to be groundless. Perhaps the line of cleavage along which dissent might have been most expected was that of the contact between evangelistic work and social service. But excepting a few trivial flings by a single after-dinner speaker, at substituting "settlements for salvation," the delegates who referred to either of these lines of work showed equal respect and interest in both of them.

Thus far, therefore, the creation of a new atmosphere, the generation of a new spirit, the organization of a new fellowship, the attainment of a common ground on which all alike can stand together without loss of self-respect or compromise of conviction, are the great gains attained by this federation. As yet this new atmosphere may only make breathing easier, but it is sure to create an atmospheric pressure that will make Christian comity between these denominations, and community co-operation between their local churches not only possible but imperative. Of course, the first, if not the final, test of sincerity and growth will be the capacity of these churches to eliminate wasteful competition and promote practical co-operation in the work of these local communities. Rural, town and city federations, more than the Federal Council and the Quadrennial Conference, will measure the spirit and the effectiveness of this

## THE TOLEDAN'S CREED

*"I Serve—I Conquer"*

**BELIEVE IN TOLEDO**, the City of **REAL VALUES**—the Nation's natural gateway of commerce and travel; in the heart of great resources and markets; with unsurpassed railway dock and harbor facilities and the near-centre of population of the United States.

**BELIEVE IN TOLEDO**, the City of **REAL OPPORTUNITIES**—with its great institutions of art, education, religion and business; a "Going concern" in industry, government and social uplift; a Home city with rest and recreation for all, by river and lake; where it is worth while to live, rear children, invest money and life.

**BELIEVE IN TOLEDO**, the City of **REAL PROGRESS**—modern in municipal equipment and spirit, aggressive in commercial activity and achievement, with inspiring visions and plans for tomorrow and a big chance for every man

church affiliation to promote the common Christian cause.

The social significance of the utterances and action at the Chicago meeting was emphasized, of course, more in the preliminary conferences of the Social Service Commission and in the discussion and adoption of its report by the main body. The report and resolutions took a far wider range than the noteworthy declaration made at Philadelphia four years ago, asserting the churches' attitude and aims toward industrial conditions and relations. The report dealt with the problems of rural and urban communities as those of the church itself. Enlistment of the churches with scientific agencies and public health authorities in the war against tuberculosis, the hook-worm disease and other plagues of unsanitary conditions, was urged as a Christian duty. "The new sense of the sacredness of womanhood" was borne in upon the conscience as an obligation to secure for women "a larger share in molding the laws which determine her destiny." By personal and organized effort and by co-operation with charitable and protective agencies and with local, state and federal authorities, the churches were enjoined to take upon them the concern for, and

care of, arriving and settling immigrants, as they would bear "the burden of the soul."

To former declarations of social faith important additions were made by this report, recognizing the claim of the family and the child upon the co-operation of the church with the community for their protection and advancement, and extending the application of Christian principles to the responsibility incurred by the acquisition and use of property and by employing the labors of others. These latter additions are claimed to be simply in line with the commission's "approach alike to favored and unfavored, to the employer and the employe equally, to the leaders of industry as to the leaders of labor." In line also are they with the policy of the commission to appeal to chambers of commerce, associations of business men, directors of employing industries, "to make their own our social platform and all its implications." In prefacing the new reference to the right of employes and employers to organize, and the responsibilities imposed by property, the report said:

"That we should thus make an advance is called for by the fact that the problems which face us, while probably not greater, are more plainly seen by us than they were four years ago.

"More clearly than then does society now recognize the right and the duty of our people, and especially the industrial workers, to seek proper organization for justice, conciliation and arbitration. Just as strongly does it feel that such organization itself should be under the higher law which it invokes.

"More distinctly do men discern that mere power does not confer a moral title to reward. That powerful interests have not ceased to take toll of our labor, to levy tribute on the people, to exercise a taxing power without authority,

and that they are thereby continuing to amass the wealth of the nation in dangerous aggregations, there is common consent.

"That a large part of this is in the nature of extortion, that it is, in too large measure, the cause of poverty and of many of the evils against which we cry aloud, that if we evade it, we are still trying to cure effects without touching causes, and are seeking to ensure moral evolution without taking account of resident forces, are matters of public conscience.

"We record, with deep regret, the increasing prodigality upon the part of irresponsible men and women who have come into large possessions, and we would point out the clear and intimate relation between a reckless and ostentatious display of wealth and the revolutionary and defiant demeanor of the multitudes who feel, whether rightly or wrongly, that it is made at their expense. We should deplore the defiance of sobriety and order on the part of every element of human society and should fix the blame on the one when it is clearly the cause, of which the other is the effect."

The Protestant churchman, in view of the achievements attained by this Federal Council, and far more by those which it makes possible, has better reason than for many a year to thank God and take courage. So have the communities which depend upon these churches for religious ideal, inspiration, sanction and sacrifice in the work for the common welfare of their people. Out of the darkness which has settled over the divisiveness of these churches, out of the gloom through which the glory of their hope has glimmered less and less throughout these years of divided counsel and suicidally competitive struggle, a new voice of hope is heard lifting the old cry with a new ending: "God's on his throne and all's well with the world," not only, but with the churches also.

## WHO OWNS THE CHURCH: OTHER VIEWS

The question raised by Joseph Ernest McAfee as to Who Owns the Church,<sup>1</sup> involves answers as divergent as the views entertained of the church itself. With those views it is not the prerogative of THE SURVEY to deal. But in this department, which hopes to become a clearing-house for the exchange of values by church workers and social workers, we may endeavor so fairly to present differing views of the church's social function as to shed light without generating heat.

To this end we publish, a rejoinder to Mr. McAfee's article by Gilbert M. Tucker, Jr., who lays the largest emphasis upon the church's independence of the state; and by the courtesy of Father John A. Ryan, of St. Paul's Seminary, St. Paul, Minn., we present his views of the interrelation of church and state, emphasizing the dependence of the state upon the church not only to supplement, but to fulfil its own function.

<sup>1</sup>See THE SURVEY, November 23, 1912, p. 237.

Some readers of THE SURVEY will side with each, but others, among whom the editor of this department is one, will seek a middle way between those who recognize the state to have little claim upon the church and those who claim that the state should subsidize private agencies, under religious or other control. That middle way involves just two sides of the road—the interdependence of church and state, upon each other and their free, voluntary co-operation as necessary to the fulfilment of the purpose of each in promoting the greatest good to the greatest number.

### *The Church Independent of the State*

In his recent article, Who Owns the Church Mr. McAfee, it seems to me, distorts and misstates the facts entirely. Who owns the church? Most assuredly the members and no one else. Granting for the sake of argument that the churches have been paid

for in considerable part by non-members, this is not the slightest argument that they own it. Does a mere contribution give one ownership? Is there no such thing as a free-will gift? Does Mr. McAfee acquire a partial ownership in the home of each friend to whom he makes a present? Does he have a vote in every institution to which he makes a voluntary gift? Does he expect a vote in the National Red Cross when he buys a Christmas seal?

The fact of it is that the relatively petty contributions to the work of the church by outsiders are wholly and absolutely free-will gifts, for as Mr. McAfee himself says the church is not a state institution. And surely the outside public gets a return more than liberal for their petty support, and this return is both general and individual for not only does the church serve the community but practically all of its privileges are open to all. Mr. McAfee cites the railroad situation but to my mind there is scarcely a point of comparison. In the case of the railroad all must pay for its use directly or indirectly, willingly or unwillingly, and moreover membership in the railroad's organization is not freely open to all in sympathy with its work or objects. No matter how desirous the individual may be he can not freely join the railroad and have a say in its management, as he can the church.

Mr. McAfee raises the point of the exemption of church property from taxation. Is it not fair that the community should make some return to charitable and educational institutions, including of course the churches, for the public services they freely render? Surely the state gets full value. Then too it is public policy—call it good business if you will—to secure to the community these benefits at the petty expense of the remission of taxes. To my mind it is comparable to the very wise legislation of New York state exempting from taxation under proper restriction private forest lands. This is a most economical way of preserving our woodlands; similarly, exempting the churches is a most economical way of securing to the community their manifold benefits. In some cities factories are exempt from taxation. Mr. McAfee himself says that churches are "near the head of the list by way of attracting new residents to the community."

The question of the activity of the individual church members in the management, and the question of whether its government shall be despotic, representative or democratic, are entirely aside the point and concern no one outside the church membership. If those who have a right to be heard in its control wish to ignore or to delegate their rights, it concerns no one but those individuals and the organizations of which they are a part. Does not Mr. McAfee, like the writer, belong to a dozen organizations ranging from—well, the church itself to a kennel club—where he has every privi-

lege of voting, but prefers to leave the management to his better informed, more interested or more active associates? Such action may show lack of loyalty or a shirking of obligations but does it concern outsiders?

Whether or not the churches are organized for the proper purpose and whether or not they are accomplishing the purposes of their organization is, as Kipling would say, another story, and again concerns only the church members. Perhaps a church devoted to the teaching of abstract theology and religious dogma follows more the spirit of the scribes and pharisees than the spirit of Christ, but it is hardly within the rights of the outsider to dictate what shall be the object of an organization to which he does not belong, and criticism of the church based on the common assumption that its aim is material social service is just as unfair as would be fault-finding with a hospital for ministering to the bodily needs of its inmates while neglecting the spiritual.

#### *Inter-relation of Church and State*

In the course of his address as president of the Minnesota State Conference of Charities and Correction on The State and Social Distress, Father Ryan clearly stated and strongly argued the view of the inter-relationship of state and church in the prevention and relief of social distress. Defining the individualistic theory of the state's function as confining it to the protection of life and property and the enforcement of contracts, and the Socialistic theory as increasing public action to the maximum and reducing private activity to the minimum, he challenged them both as wrong because proceeding from "a faulty analysis of concrete facts and from a lack of right fundamental principles." The true principle he conceived to be "that the civil authority should deal with no social distress which could be dealt with equally well by private action." Admitting that the cost might be greater when such work as the care of dependent children is shared by voluntary associations, he argued that "the resulting loss in charitable feeling, personal responsibility, and individual initiative, would not be offset by the lower cost of financial administration."

This statement, Father Ryan regards not only as a correct political principle, but also as one of the two or three great basic truths of democracy. "This is one of the reasons why men who think fundamentally prefer an indifferent republic to the most efficient and benevolent despotism."

"The state and only the state," he affirms, "can prevent a large part, probably the larger part, of the social distress which is due primarily to environment." He asserts it to be within the province and the ability of the state to provide suitable economic conditions by enforcing reasonable minimum standards of labor and livelihood, by provision against unsafe and unsanitary work places, forbidding child labor, interdicting the employment of women and young

persons at tasks harmful to health and morals. This Father Ryan claims will not injure individual initiative or freedom, but "will merely lift the plane of competition within reasonable and healthy limits."

But he denies the efficacy and ability of the state to deal with distress arising from the individual's limitations and delinquencies. Only where "schools fitted to educate the conscience, the hand and the eye as well as the intellect" cannot be supplied by voluntary effort, they ought to be provided for by the state. But the state's assistance to private schools "on the basis of results achieved in conformity with standards set up by the state, has advantages over an efficient system of state schools." These are some of them: It stimulates individual and local initiative and energy, encourages individuality, variety, originality and competition, and counteracts that mechanical mediocrity, that depressing uniformity, that undesirable professional bureaucracy, which are the natural consequences of a single type or single system of institutions under state monopoly. Therefore Father Ryan, at this point again, concludes that the state can "sometimes promote social welfare more effectively by indirect than by direct action, by subsidizing efficient private institutions instead of conducting institutions of its own."

The same argument is urged with regard to the relief of moral distress in correctional institutions, especially for women and young offenders. It is maintained that "the state cannot do this work as effectively as a private institution conducted under frankly religious influences. For, the correction of moral defects and the building up of character suppose moral instruction and training, and these have not yet been successfully given except in connection with religion." "As a rule, then," he concludes, "the most effective plan for the relief of moral distress in institutions is to have the greater part of the work done by private religious agencies, subsidized by the state in accordance with the number of inmates." The state's duty to supervise saloons and suppress brothels, to regulate dance halls and prosecute clandestine prostitution, is imperatively demanded.

With regard to the administration of relief, the state's province is held to be narrower than in prevention. Striking the balance between public and private relief, the necessity of having both in co-operation is admitted, but "the

ideal condition would be to provide all relief through voluntary agencies." The conclusion, hitherto reached at each point, is here still more inclusively applied: "What has been said above regarding the advantages of the state's subvention of private institutions under strict state supervision, is in a general way true with regard to the institutional care of physical suffering and dependency."

The value of the reflexive influence of charity upon the charitable is pleaded in this culminating argument: "Moreover, so long as misery exists, its capacity to arouse, keep alive and develop the feelings and principles of sympathy, brotherhood, and social solidarity, ought to be utilized to the utmost. Individuals and classes should be given this opportunity to obtain this opportunity. Especially is this true of small and local groups, as the parish, the fraternal society, the town, the rural neighborhood. . . . Neither in the field of prevention, nor in that of relief, is it wise or right for the state to do anything that can be done as well by voluntary agencies; and wherever practicable it should subsidize, co-operate with and supplement private endeavor."

#### CORRESPONDENCE

From a bishop comes the suggestion of an investigation of the administration of relief funds by corporations as one of the ways in which organized religion may do something practical in the interests of working people. In a very different direction a layman reports one result of the Men and Religion Forward Movement to be a community extension campaign by "the Industrial Evangelistic Foundation." Opening at Greensboro, N. C., it is being followed up at industrial centers in Kansas, Pennsylvania, Indiana, Missouri, Alabama and Texas.

From New York we learn that the last Sunday on which the battleships of the Atlantic fleet were in the harbor, a company of 115 young people distributed 24,600 portions of the Gospels to as many men on thirty-two ships, a handsomely engrossed copy of the Bible being given to Rear-Admiral Osterhaus. Among other sailors in the harbor, 15,000 volumes were distributed. Over 85,000 volumes were distributed among immigrants landing at Ellis Island, who carried the books into every state of the Union. Over 130 institutions were also supplied with Bibles by the New York Bible Society, which made the other grants also.

#### GOOD CHEER

Out of the soil,—  
The lily;  
Out of the ooze,—  
The pearl!  
Up from the mortal  
Soars the immortal;  
After hell's battle  
White flags unfurl!

God's here in His world,  
And the cross stands for human redeeming.  
Far o'er the sad earth  
Heaven's radiance forever is streaming.  
Therefore, my soul, be true  
And undaunted;  
Never by ghosts of old fears  
Be thou haunted!

Right is right;—and not might.  
Truth is truth;—and not sneers.  
Love is love;—dry the tears.  
God is God;—face the light!

—Waufarer

FIRST SCREENED MARKET IN NEW ORLEANS

New Orleans has been the scene of a war for cleanliness which has given Oscar Dowling, head of the Louisiana Health Board, a national reputation. Mr. Dowling as the representative of the public in the case of the *People vs. Dirt*, has conducted throughout the state by means of a special train popularly dubbed "Health on Wheels" not only a crusade of education but also a campaign of police power which has left in its wake a trail of rebuilt, renovated or cleaned schoolhouses, dairies, slaughter-houses, hotels, restaurants, drug-stores, barber-shops and markets. The Louisiana health train has toured the country and attracted the attention of other states. Both New York and Iowa have begun on the health train plan.

## HEALTH

FOR the last three or four months our medical journals have had reports concerning the bitter conflict that has been going on in Great Britain between the liberal government and the British Medical Association over the terms of the Insurance Act. It is a peculiar fact that, although this law is probably the most revolutionary, so far as medical practice is concerned, of any measure yet introduced in any English-speaking country, the controversy between the government and the physicians has been almost entirely over the question of compensation, and not over the principles on which the law is based. Little seems to have been said by the British Medical Association to indicate that this body had any concern in the matter aside from the question of fees. Indeed, the association has followed the most extreme of trade union tactics. The conduct of negotiations has been entirely in the hands of the leaders. There has been no referendum to the rank and file of the profession, the men really interested, and all attempts on the part of individual physicians to make their own agreements with the home office have met with expulsion from the ranks of the association, followed by the declaration of a rigid boycott against the offenders.

That there are physicians in the United States who see more in this new policy of the British government than a mere business arrangement with the doctors is evident from an editorial which recently appeared in the official organ of the American Medical Association. The writer says:

"If we are not mistaken, this law marks the beginning of the end of the old system of the individual practice of medicine and of the old relationship between patient and physician—the beginning of a new era, both for society and for physicians. It provides for nothing less than an assumption, on the part of the government, of the responsibility of providing proper medical care for citizens who are financially unable to secure it for themselves. Under the terms of the act, all persons whose total annual income is less than \$800 (£160) will be entitled to medical services furnished by the government and paid from a fund made up jointly by workmen, employers and the government. Persons having an income above \$800 will continue to provide their own medical services as heretofore—for the present. It is estimated that approximately 15,000,000 of the inhabitants of the United Kingdom are by the terms of this act taken out of the field of private practice.

"The effect of such a law can be nothing less than revolutionary, as far as the economic conditions of the medical profession are concerned. That the discussion has centered almost entirely around the question of compensation shows that physicians have no objection to being made state health officers or to having the present system of private practice largely reduced, if not abolished, so long as they are adequately compensated for their work. The question of a fair and adequate compensation for physicians is, of course, vital. It is, however, largely a local question. The important feature is the recognition of the

fact that it is the duty of society, as represented by the government, to furnish medical treatment for those who are unable to secure it for themselves. It also means the recognition of the modern physician as a health officer of the state, working for the general good, rather than as a private, professional or business man.

"There is room for much speculation as to the ultimate results. For one thing, it practically eliminates the necessity for medical charity, and so stops the enormous drain on physicians which has resulted therefrom. If it is true, as was reported several years ago by a committee of one of our large local organizations, that 25 per cent of the professional work done by physicians is entirely gratuitous, the abolition of this enormous non-productive class of work would be beneficial. Another important consideration is that the adoption of such a plan would do away with any possible mercenary motive which might be alleged against the individual physician or the medical profession as a whole, as a reason for any indifference or apathy toward the development of preventive medicine. A third and by no means less important result will be that those persons who, under the present private practice system, are the least able to consult physicians frequently, and who are yet most exposed to and susceptible to preventable diseases, can secure the advice and services of medical men before, rather than after, the disease has developed. That some form of periodic, systematic medical inspection will develop out of the state system of medicine thus created in the United Kingdom seems probable.

"Last is the effect which such a measure will have on medical education and the personnel of the profession. If the state assumes the responsibility of providing medical services for any large proportion of its citizens, it must necessarily pay strict attention to the quality of service which it provides, as a physician working under the Insurance Act will be necessarily a representative of the state. This will make it necessary for the government not only to exercise more rigid supervision over medical colleges and the character of medical instruction, but also to adopt some system which will prevent those already qualified to practice from becoming inefficient through laziness or indifference.

"Physicians in the United States will be interested in the development of this plan in Great Britain principally on account of the light it will throw on such a plan in this country, for the possibility that the adoption of some arrangement of this sort will sooner or later be considered on this side of the Atlantic may be acknowledged. The prevention of disease is becoming more and more recognized as a social and not a professional duty. Most preventable diseases today are due to sins of the community rather than to sins of the individual. The state in the future must protect the citizen against disease just as it now protects him from foreign invasion. In fact, the majority of our most

dreaded diseases are foreign invaders, as far as civilized nations are concerned."

\* \* \*

NEW questions in sociology are continually arising. Ten years ago few outside a small group of experts discussed or attempted to pass judgment on such a question as the sterilization of the feeble-minded and of certain types of criminals. Now, however, the larger public is forced to give some thought to this matter, because it has suddenly leaped into amazing prominence, and the procedure has not only found enthusiastic advocates, especially among physicians and so-called eugenicists, but it has even become a legalized part of criminal practice in certain states.

Indiana, Washington, Colorado, Connecticut, Nevada, Iowa, New Jersey, and New York have all passed laws which provide for some form of sterilization of defectives and of certain criminal types. In Pennsylvania a similar bill was vetoed by the governor, and in Kansas and Nebraska the experiment with such methods of dealing with sexual offenders has been temporarily abandoned. The New Jersey law has been very carefully planned to avoid abuse, but has not been in effect long enough to warrant conclusions as to its practical outcome. Indiana has given the sterilization plan a seven years' trial, and in the reformatory at Jeffersonville about three hundred men have been thus operated on.

The medical profession is inclined to look with favor upon such legislation, to judge by recent editorials in the medical journals. The lawyers are also studying the question. The American Institute of Criminal Law and Criminology, at a meeting recently held in Milwaukee, received the report of a committee which had been appointed by the Wisconsin branch of the institute to look into the question of the sterilization of defectives and certain types of criminals. The report considers three methods by which the propagation of the defective can be prevented; namely, regulation of marriage, which is approved but held to be of comparatively slight effect; sequestration, which if perfect would be absolutely effective, but the committee doubts if it is either possible or desirable to make it perfect; and, finally, sterilization, which last is not recommended or condemned, the committee simply summarizing the laws bearing on it in the different states.

To anyone reading the report carefully it would seem that the committee makes a rather sweeping classification of people who are regarded as defectives and unfit to propagate their kind. One would hesitate to class epileptics, neurotics, drunkards, and paupers together with the insane, feeble-minded, and criminal. It is only necessary to remember Max Nordau's famous book on degeneracy to recognize that some of the world's greatest geniuses have belonged to one or more of these classes. Indeed, in considering this question of the breeding of the

"unfit" one of the first things that strikes us is the lack of a standard of fitness. We would all probably agree that the insane and feeble-minded should be restrained from bearing or begetting children, but would we be willing to apply this same restriction to all who suffer from functional derangements of the nervous system?

In the writings of physicians it is usually assumed that "the fit" means the physically fit, and a careful perusal of recent literature on eugenics shows that this is true of the utterances of many followers of this new science. But the student of evolution has never held that the survival of the fittest meant the survival of the most nearly perfect physical animal, but only of the animal best adapted to his environment. In a highly civilized society the intellectual neurotic with a poor physical development may be better fitted for the struggle for existence than is the hardy peasant from a simpler civilization. It may be urged that this is deplorable and a proof of national decadence; still there was once a nation which made health and a well-rounded physical development the only test of fitness, and the Spartans have left the world no heritage of art, ethics, philosophy or literature, only a tradition of physical courage and endurance hardly superior to that of the American Indian.

\* \* \*

**A**MONG the many discussions concerning the forcible prevention of the breeding of the unfit we hear occasionally a voice raised in protest to warn us that by adopting such measures the state may be diverted from a sense of its responsibility in regard to those conditions which produce criminality and degeneracy. These objections were voiced movingly by Peter Kropotkin at the Eugenics Congress in London last August.

To quote part of his speech:

"I came this morning with the intention of expressing my deep regret to see the narrow point of view from which eugenics has been treated up till now, excluding from our discussions all this vast domain where eugenics comes in contact with social hygiene.<sup>1</sup> This exclusion has already produced an unfavorable impression upon a number of thinking men in this country, and I fear that this impression may be reflected upon science altogether.

"Before science is enabled to give us any advice as to the measures to be taken for the improvement of the human race, it has to cover first with its researches a very wide field. Instead of that we have been asked to discuss not the foundations of a science which has still to be worked out, but a number of practical measures, some of which are of a legislative character. Conclusions have been already drawn from a

<sup>1</sup>Kropotkin uses this term in its literal significance, a significance we in this country have almost forgotten, as with us it has come to signify the control of venereal diseases.

science before its very elements have been established.

"Thus we have been asked to sanction, after a very rapid examination, marriage certificates, Malthusianism, the notification of certain contagious diseases, and especially the sterilization of the individuals who may be considered as undesirable.

"In my opinion, Professor McDonnell was quite right when he made the remark that it was untimely to talk of such measures as these at a time when criminologists themselves are coming to the conclusion that the criminal is "a manufactured product," a product of society itself. He stood on the firm ground of modern science. I have given in my book on Prisons some striking facts, taken from my own close observation of prison life from the inside, and I might produce still more striking facts to show how sexual aberrations described by Krafft Ebing are often the results of prison nurture, and how the germs of that sort of criminality, if they were present in the prisoner, were always aggravated by imprisonment.

"But to create or aggravate this sort of perversion in our prisons, and then to punish it by the measures advocated at this congress, is surely one of the greatest crimes. It kills all faith in justice, it destroys all sense of mutual obligation between society and the individual. It attacks the race solidarity—the best arm of the human race in its struggle for life.

"Before granting to society the right of sterilization of persons affected by disease, the feeble-minded, the unsuccessful in life, the epileptics (by the way, the Russian writer you so much admire at this moment, Dostoyevsky, was an epileptic), is it not our holy duty carefully to study the social roots and causes of these diseases?

"When children sleep to the age of 12 and 15 in the same room as their parents, they will show the effects of early sexual awakenings with all its consequences. You cannot combat such widely spread effects by sterilization. Just now 100,000 children have been in need of food in consequence of a social conflict. Is it not the duty of eugenics to study the effects of a prolonged privation of food upon the generation that was submitted to such a calamity?"

\* \* \*

**T**HE new (seventh) edition of Dr. S. Adolphus Knopf's international prize essay, *Tuberculosis, a Disease of the Masses and How to Combat it*, has now been translated into French by Dr. Eugene Grenier of the Bruchesi Tuberculosis Institute at Montreal. Dr. Grenier's new French Canadian translation represents the twenty-eighth foreign edition which with the seven published in the United States makes thirty-five imprints of this work in twenty-four different languages.

# THE PUBLIC HEALTH MOVEMENT

IRVING FISHER

The conservation movement is a movement to prevent waste. When the Conservation Commission was appointed four years ago, emphasis was placed on the wastes of our natural resources, but by the time the commission made its report it had come to the conclusion that by far the most serious as well as the most preventable wastes are the wastes of human life.

A generation ago it was a common impression that the average human lifetime was fixed as by a decree of fate. When I was in college one of our revered instructors showed us a mortality table, and said with great impressiveness: "There is no law more hard and fast than the law of mortality." I believed it, and even yet many people are under this delusion. Pasteur did much to introduce a more optimistic view. He stated his belief in these immortal words, "It is within the power of man to rid himself of every parasitic disease." He staked this opinion on his own wonderful laboratory revelations as to germ life. Today we can confirm his words by absolute statistics. And now his successor, Metchnikoff, has surpassed even Pasteur in optimism. Metchnikoff is devoting himself to the prolongation of human life, and already gives us a vision of the time when centenarians will be regarded merely as in the prime of life, and when the normal life span of a century and a quarter will be a frequent occurrence.

The growing consciousness that human life is not a fixed allotment, which we must accept as our doom, but a variable, which is within our power to control, has recently led to extraordinary exertions all over the world to save human life. This impulse has gained strength also from the great and almost universal decline in the birth rate. Old countries like France and new countries like Australia are confronted with the specter of depopulation. Consequently, as human life becomes scarce, it becomes precious—like any other commodity! These two facts, the consciousness that much mortality is preventable, or, at any rate, postponable, and the fact that increasingly fewer babies are being born in the world, are together operating to produce a great health movement throughout the world. Nothing will stop it until the whole world is convinced of the paramount importance of this problem of human conservation.

This world-wide movement for the conservation of human life has expressed itself in many ways—in medical research; in societies for preventing tuberculosis, infant mortality, social diseases, alcoholism, and vice; in the growth of sanatoria, dispensaries, hospitals and other institutions; in an immense output of hygienic literature, not only technical books and journals, but also popular articles in the magazines and daily newspapers; in the constant agitation and legislation for purer foods, milk supply, meat supply and water supply; in the movement to limit the labor of women and children and to improve

factory sanitation; in the establishment of social insurance in Germany, England, Denmark and other countries; in the improvement of Departments of Health; in the spread of gymnastics, physical training and school hygiene; in the revival of the Olympic games and the effort to revive the old Greek ideals of physical perfection and beauty, and last and most important, in the sudden development of the science of eugenics.

In the summer of 1911 there was held in Dresden a unique world's fair, devoted exclusively to health—the International Hygiene Exhibition. In this were shown the fruits of the whole movement in all lands—except, alas, our own; for to our shame it must be said that we as yet are among the backward nations in this movement for the conservation of human life. Our Congress was asked to appropriate \$60,000 to erect a building and supply an exhibit to show what we have done for our part in this movement, but Congress thought it could not afford so large an expenditure for so small (!) an object, and the result was that from the millions of people who visited this exhibition one constantly heard the question asked: "Where is the United States?"

And those few Americans who did go to visit the exhibition found that other nations had far outstripped us in this movement for national sanitation and health. Some of the achievements already attained by other nations should be recorded among the wonders of the world. One is the striking decline of the death rate in the city of London. Within two decades London's death rate has virtually been cut in two, and is now only thirteen per thousand, or less than that of most cities one-fiftieth its size.

Probably, however, the greatest achievement of any country is that of Sweden, where the duration of life is the longest, the mortality the least, and the improvements the most general. There alone can it be said that the chances of life have been improved for all ages of life. Infancy, middle age and old age today show a lower mortality in Sweden than in times past, while in other countries, including the United States, although we can boast of some reduction in infant mortality, the mortality after middle age is growing worse, and the innate vitality of the people is, in all probability, deteriorating. The reason why Sweden of all countries has succeeded in improving the vitality of middle age and old age, while other nations have failed, is, I believe, to be found in the fact that Sweden, of all nations, has seen the problem of human hygiene as a whole instead of partially. In most other lands, and particularly in the United States, public health has been regarded almost exclusively as a matter of protection against germs; but protection against germs, while effective in defending us from plague and other epidemics of acute diseases, is almost powerless to prevent

the chronic diseases of middle and late life. These maladies—Bright's disease, heart disease, nervous breakdowns—are due primarily to unhygienic personal habits. Medical inspection and instruction in schools, as well as Swedish gymnastics, have aided greatly in the muscular development of the citizens of Sweden. Swedish hard bread has preserved their teeth. The Gothenburg system is gradually weaning them from alcohol. There has even been a strong movement against the use of tobacco. Other countries are tardily following in the path which Sweden has trod so successfully.

The significant fact is that Sweden has not hesitated to attack the problem of personal habits. I believe we must have a revolution in the habits of living in the community if we are going really to realize the promise of Metchnikoff and others as to the prolongation of human life. Health officers in this country have not regarded it as a part of their duty either to live personally a clean, hygienic life, or to teach others to do so, or even to investigate what those conditions of well being are which make for personal vitality.

I can remember, thirteen years ago, talking with a doctor in Colorado as to the habits of living of his patients. I said to him: "You tell me that tuberculosis is a house disease, and that the reason it exists is because people do not open their windows. Why, then, do you not tell your patients they must open their windows, or sleep out of doors?" He said, "I wouldn't dare to do that; I would lose my practice. They would think I was a crank, and meddling in their personal affairs." Today that battle has been largely won. Today, not only in Colorado and California, and in the places where there is perpetual sunshine, sleeping out of doors is common and not confined to invalids, but is indulged in by the community generally. Even in New England and throughout the country you will find sleeping balconies going up all over. The change has even affected in some degree the architecture of the country, and while as yet only a minority of the people sleep out of doors, yet I believe it is true that the majority of the people in the United States have far more air in their sleeping and living rooms today than ten years ago. The fact which the doctor in Colorado did not dare tell his patients thirteen years ago has in some way been told to the people of the United States.

But there are many other things that need to be told, after we are sure that they are true. When we have, through our national, state or municipal officers, made thorough investigations and have been able to discover the actual truth as regards eating and drinking, hours of work, recreation and play—all those facts that go into what may be called personal habits—then we may gradually overturn existing unhygienic habits of living. John Burns attributes a large part of the great reduction in London mortality to the improved personal habits of working men, particularly in regard to alcohol. In this country Dr. Evans, both as health officer of Chicago and later as health editor of a Chicago newspaper, has shown how public instruction in personal

habits can be made effective, and it will be largely through affecting personal habits that the life insurance companies will improve the longevity of their policy-holders.

Scientific men today have reached substantial agreement that alcohol is a poison. When everybody understands this, the days of alcohol as a beverage will be numbered. Sweden in the 30's was called drunken Sweden, but today the anti-alcohol movement there has converted Sweden into one of the soberest of countries.

But the use of tobacco, tea and coffee ought also to be investigated, so that we may know how far they are deleterious, and to spread this knowledge among the people.

Fashions are in their essence changeable, and the time will come when the world will not be built on fashion, but on reason. Japan has made more rapid progress in civilization than any other nation—because the late Mikado resolved and publicly stated that the institutions of Japan must not be tied by tradition, but must be based on reason. When we have replaced tradition by reason, we shall have gotten a solid basis for civilization, and this must apply to ancient customs and habits of every kind. I am firmly convinced that we are looking at only one-half of this public health movement as long as we confine ourselves to the acute or infectious diseases. We shall not get more than half the results obtainable until we realize that there must be a revolution in the personal habits of the people.

Yet the United States, in spite of its shortcomings, has some special triumphs to record. We have, through hygiene under Colonel Gorgas, made it possible to dig the Panama Canal. We have virtually abolished yellow fever on our shores and in Cuba. We have nearly eliminated hookworm disease in Porto Rico and are gradually doing the same in the southern states. We have found a remedy for one form of spinal meningitis. We have, in New York, made an object lesson in the last year of reducing the summer death rate of infants in a striking manner. We have, by individual milk stations in Boston and other cities and in individual sanatoria, dispensaries and other institutions, demonstrated that the death rate from specific diseases can often be cut in two.

Yet we have depended altogether too much on private initiative. In New York the summer death rate of infants was reduced chiefly through the work of the milk committee and individuals like Nathan Straus. The discovery of the wide prevalence of hookworm disease and the discovery of the serum for spinal meningitis came through the gifts of Mr. Rockefeller. It is well that individuals should apply themselves to these problems, and without such personal interest they could never be solved. Nevertheless, progress will be many times as rapid when the problems for the nation are managed in a national way. There are three great agencies to which we must look for the saving of human life in the future, and it has been the object of the Committee of One Hundred on National Health, of which I am president, to help stir these three

agencies into activity in this country. They are the public press, the insurance companies and the government.

To a limited extent, all these agencies have increased their health activities in recent years. A few years ago popular articles on public health were seldom seen, because the public and the press thought the subject of disease uninteresting and repulsive. Today, on the other hand, one can scarcely pick up a popular magazine without finding not only one, but several, articles dealing with questions of public health; and it has been found possible not only to make these articles interesting, but, by emphasizing the positive or health side, instead of the negative or disease side, to render them attractive and beautiful. And yet, as Dr. Wiley has said, the newspapers, in spite of all the good they are doing with their right hands, are, with their left hands, in their advertising columns trying to undo that good by advertising the fraudulent part of the "healing" profession who are trying to line their own pockets at the expense of the lives of the public.

The second great agency from which, I believe, we may expect wonderful results in the future is life insurance. As our committee pointed out to the association of life insurance presidents several years ago, life insurance companies can save money by preventing deaths just as fire insurance companies have saved money by preventing fires, and steam boiler insurance companies have saved money by preventing explosions. Since this suggestion was made, a number of progressive life insurance companies have tried the experiment. The Metropolitan and the Equitable have established departments of human conservation, and a number of other and smaller companies have undertaken similar enterprises. The Postal Life Insurance Company has recently published the statistical results of their experience, worked out in a most careful manner, and has demonstrated absolutely that it pays life insurance companies to save human life. This be-

ing the case, we may expect life insurance companies in the future to become active in life conservation. Already there are probably fifteen million policyholders in the United States insured in companies which are trying to do something for their health—through medical examinations, instruction in hygiene, utilization of visiting nurses, participation in civic health movements and otherwise. To save human life merely to save money is sordid enough, but it is well to harness commercial motives, when possible, in the service of humanity.

The third and most important agency is the government. State and national health offices are becoming yearly stronger and more efficient; and yet much remains to be done, particularly by the national government. We need a national department of health or a department of labor which shall include in its operations the conservation of human life. We have already passed the phosphorus match bill to prevent one of the worst industrial diseases—phossy jaw. We have passed effective legislation in regard to interstate commerce in prostitution. We have established a Children's Bureau, and a Bureau of Mines to prevent industrial accidents in mining. We have enacted suitable legislation in regard to cocaine and habit-forming drugs. We have a Pure Food Law and laws for the inspection of meats. Yet, as Dr. Wiley, Mrs. Crane and others who have watched the operation of these laws at close range well know, they need to be executed with a stronger hand.

The truth is that as yet we have only made a feeble beginning in public health work, especially in this country. We need, first of all, to do what Sweden has done for a hundred and fifty years—namely, to keep proper vital statistics. Vital statistics are the bookkeeping of health, and we cannot economize health any more successfully than we can economize money unless we keep books. At present only a little over half of the population of the United States has statistics of its deaths, while the statistics of the

births are as yet nowhere sufficiently accurate to be called real statistics.

Our national statistician, Dr. Wilbur, illustrates by a story how much better we keep our commercial books than our books of vital statistics. In a western state a girl was entitled to a fortune when she became twenty-one. Reaching, as she supposed, her twenty-first birthday, she laid claim to the fortune. Much to her surprise, her father said: "But you are only nineteen"; and then the two tried to look up the records. They had no family Bible, they had no public record office to go to, and they were at sea as to how to discover exactly the date when she was born. However, it suddenly occurred to her father, who was a farmer, that on the very day his daughter was born a calf was born on his farm, and the birth of the calf had been recorded. In that way he established the date of the birth of his daughter.

In view of the great lack of our vital statistics, therefore, we cannot measure even the death rate, much less the number of preventable deaths in the United States. All that we can do is to study carefully the registration area, and on this basis to work out certain minimum figures.

Four years ago, as a member of President Roosevelt's Conservation Commission, I endeavored to do this and to report on the condition of our "national vitality." I found, after getting together all the statistics available and taking account of the degree of preventability of different diseases as estimated by experts, that out of some 1,500,000 deaths annually in the United States at least 630,000 are preventable! Of these preventable deaths the greater number are from seven causes. These seven causes include three great diseases of infancy; then typhoid fever, which usually makes its attack in the twenties; then tuberculosis, accidents in industry, and pneumonia, which come in the thirties.

Now 630,000 unnecessary deaths per year mean over 1,700 unnecessary deaths per day, or more than the lives lost in the Titanic disaster! The nation cannot continue indifferent to hygiene as it gradually dawns on the public that for lack of hygiene we suffer a Titanic disaster every day of the year. The popular imagination was deeply stirred by the image of 1,600 helpless human beings suddenly engulfed in midocean. That was a vivid dramatic picture which the blindest of men could see and understand. It led to immediate official action on both sides of the Atlantic to safeguard human life at sea. Yet on land we lose 365 times as many lives as this every year, and never stop to add it up! They are scattered and diffused throughout the land—a Wilbur Wright lost from typhoid, a handful of miners in an explosion, some railway employes in an accident, some victims of lead poisoning, a little army of infants, here a few men and there a few. Yet these deaths are just as real and mean an infinitely more serious loss than the deaths from the Titanic disaster. Moreover, they could be as easily prevented.

And concomitant with this unnecessarily great death rate there is, of course, a colossal aggregate of needless sickness. We have no real sta-

tistics, but by analogy with English statistics we may assume that, on the average, for every death per annum there are two persons sick during the year. This makes about 3,000,000 people constantly lying on sick beds in the United States, of which, on the most conservative estimate, at least half need not have been there.

If, now, on the basis of these figures, we try to compute how much human life is needlessly shortened in the United States, we find that it is shortened at least fifteen years. Again, if we translate these preventable losses into commercial terms, we find that, even by the most conservative reckoning, this country is losing over \$1,500,000,000 worth of wealth-producing power every year.

What does this mean? To us individually it means that we are losing a large part of our rightful life not only by death itself, which cuts off many years we might have lived, but also from diseases and disabilities which are not fatal but cripple the power to work and mar the joy of living. I believe I am far within the facts when I venture the opinion that the average man or woman in the United States is not doing half of the work nor having half of the joy of work of which the human being is capable.

With all this room for improvement before our eyes, it is not surprising that the zeal of the health movement is growing fast. Each success serves as justification for further effort.

One of the most encouraging symptoms of progress is the great attention which was paid to public health in the recent political campaign. All three of the party platforms included planks in behalf of public health. The Democratic and Progressive platforms were particularly explicit and emphatic, and all the candidates have emphasized health in speeches and in their record in public life.

These and other indications augur well for better legislation, more energetic enforcement of the law and, above all, a more appreciative public sentiment as to the transcendent importance of the conservation of human life. It is now reported that Dr. Roche, secretary of state in Canada, is in strong sympathy with the proposal there for the establishment of a Federal Department of Health, and the Republic of China is reported to have already established such a department.

From all these indications of actual activity, as well as from the logic of the situation, we are justified in predicting that an age of human conservation is at hand. Men and women are waking to their responsibility to the race. Eugenics will be a watchword of the future. To squander our natural resources is ignoble indeed, but far worse is it to squander our vital resources. The most sacred obligation of each generation is to bequeath its life capital unimpaired to the generation which comes after. Scourges like typhoid and tuberculosis must be swept off the face of the earth. Habit-forming drugs, including alcohol (and even tobacco, especially for young boys), must be recognized in their true light as means of depleting the vitality of nations. Prostitution and the white slave

traffic must be condemned anew as robbers of the race. Industries which kill and maim, poison or infect their workers, which deform and stunt little children, which incapacitate women for normal motherhood, which through overlong hours of toil close each successive day's work with progressive exhaustion, must be controlled. Machinery was made for man, not man for machinery. Marriage laws and customs must be adjusted so as to discourage or forbid the procreation by the unfit. All these and other hygienic and eugenic reforms will be realized as fast as public sentiment becomes educated to the solemn responsibilities and higher valuations of human life.

The noblest task, therefore, which I can conceive for any man is to aid in erecting true ideals of perfect manhood and womanhood. Our ideals, though improving, are not yet worthy to be compared with those of Japan or Sweden, and the ideals even of these countries have not yet reached the level of those of ancient Greece still imaged for us in imperishable marble. With superior knowledge, our health ideals should excel those of any other age. These ideals should not stop with the mere negation of disease, degeneracy, delinquency and dependency. They should be positive and progressive. They should include muscular development, a sound mind in a sound body, integrity of moral fiber, a sense of the splendor of the perfect human body as a temple of the human soul, a sense of the enjoyment of all life's proper functions. As William James said, simply to breathe or move our muscles should be a delight. The thoroughly healthy person is full of joy and optimism. He rejoiceth like a strong man to run a race. Said Emerson: "Give me health and a day, and I will make the pomp of emperors ridiculous!" Our health ideals should be nothing short of an abiding sense of the sweetness and beauty, the nobility and holiness of human life.

### JOTTING

#### SOCIETY FOR INSTRUCTION OF EUGENICS

A "Society for the Instruction of Eugenics," with headquarters in New York, is announced. Its stated purpose is "for the benefit of every one who desires to give to all children moral self-protection by a simple and true knowledge of the science of life, which means eventually a higher order of morality, spirituality, intellect, and physical perfection for future generations." A pamphlet which is issued to the public makes a strong plea for a law compelling the teaching of eugenics in every school. This term, which is used in many senses nowadays, is here meant to cover sex physiology and pathology. No entrance fee is required for membership in the society, merely the signature of an enrollment slip, stating that the signer is in favor of such a law. The pamphlet is issued by Margaret Irving, founder, 12 East 38th Street, New York.

## "Do a Good Turn Daily"

(Not a slogan)

"A scout is helpful . . . He must do at least one good turn to somebody every day." Section No. 3 of the Scout Law, Boy Scouts of America.

¶ A slogan is only a slogan, but a good turn speaks for itself.

¶ Let the example of the Boy Scouts of America be your inspiration to **do a good turn to-day**. A far-reaching good turn.

¶ It is easy. The Boy Scouts of America will help you.

¶ For three dollars you can join them as an Associate Member. They will make the money go a long way. It will be distributed as follows:

\$1.00 for your boy and the boys of the local troop to help them in their work.

\$1.00 for the other boy National Headquarters wants to help.

\$1.00 for a year's subscription to **Boys' Life**, The Boy Scouts' Magazine, to be sent to you, to your boy, or to any boy you designate. It does good wherever it goes.

## THE COMMON WELFARE

### COMMISSION ON INDUSTRIAL RELATIONS

On December 17 President Taft sent to the Senate his appointments for the Commission on Industrial Relations, authorized by act of Congress last August. The day following, in New York, an emergent meeting of the committee which had promoted the legislation was called, and a statement given to the press to the effect that as a whole the President's nominations for the board of inquiry fell short of the high hopes of those who had been most concerned in promoting it.

Under the law, no fewer than three of the commissioners must be employers of labor, no fewer than three must be representatives of employes, and no restrictions were placed upon the selection of the other three members. The President's nominations follow:

#### REPRESENTING THE PUBLIC:

George Sutherland, attorney-at-law, Republican United States Senator from Utah chairman of the Federal Employers' Liability Commission, which reported a workmen's compensation system to the present Congress, a marked advance over the old common law. This legislation, which was opposed by the railway unions, was defeated. The bill was also criticized for granting only partial benefits to the non-resident families of alien workmen.

George B. Chandler, Rocky Hill, Conn., Republican; representative of the American Book Company; member of the Connecticut Legislature since 1909, and chairman of its committee on labor, investigating and reporting on workmen's compensation in 1911; chairman of a subcommittee on the cost of living (1911); described as "a leader in the successful fight to secure a public utilities act."

Charles Simon Barrett, Union City, Georgia. Credited with being a Democrat. President of the Farmers' National Union, and former member of the Roosevelt Country Life Commission.

#### REPRESENTING EMPLOYERS:

Frederick A. Delano, Chicago. Receiver and former president of the Wabash Railroad. Identified with various civic and reform movements in Illinois. As president of the Wabash Railroad, his relations with the labor unions have been cordial.

Adolph Lewisohn, New York, Capitalist, President United Metals Selling Co. and General Development Company; director of various other corporations. President Hebrew Sheltering Guardian Society. Donor of the School of Mines building in Columbia University and very recently of a stadium to the City College. He served as vice president of the Committee which has carried on the campaign for the commission of inquiry.

Ferd C. Schwediman, St. Louis, electrical engineer, vice president of the National Manufacturers' Association, General Manager of the Racine-Sattley Company, Springfield, Illinois. As chairman of the Committee for Accident Prevention and Workmen's Compensation of the National Association of Manufacturers, Mr. Schwediman made elaborate investigations in this country and abroad, and has been responsible for stimulating an interest in the reform of the old laws of employers' liability among fellow members of the association. Within the last two years he has carried on an energetic campaign for safety.

#### REPRESENTING EMPLOYEES:

Austin B. Garretson, Iowa, president of the Order of Railroad Conductors, one of the great railway brotherhoods, none of which are constituent members of the American Federation of Labor.

John B. Lennon, Bloomington, Illinois, treasurer of the American Federation of Labor. For many years an executive of the International union of journeymen tailors.

James O'Connell, District of Columbia, vice president of the American Federation of Labor, formerly general secretary of the machinists' union.

After the meeting of the Industrial Relations Committee, the following statement was given to the press bearing the signatures of the New York members of the committee. Telegrams were read at the meeting from out-of-town members, a majority of whom expressed themselves to similar effect:—

"The appointments by the President to the Commission on Industrial Relations, just announced, are a great disappointment to the large body of economists and social workers who presented to the President and to Congress the need for a searching inquiry into the causes of unrest and the relations of labor and capital. Such an inquiry would be of great value to the nation, if conducted by a group of persons well known for their special training and experience

in relation to the problems which have grown out of recent industrial changes and the widespread disaffection of labor, who would work together and present in an authoritative way to public opinion the reasons for much needed remedial legislation. Some of the nominees are men of ability and distinction in public affairs, but the commission as a whole fails especially in the following particulars:

"1. No woman has been named a member of the commission, although there are now more than 6,000,000 women wage earners in the nation.

"2. There is no well known economist or social worker, to speak for the increasingly effective work that is being done by our universities and colleges, civic and social organizations and the more authoritative element of the public press, in the analysis of the forces of industrial democracy.

"3. While the three representatives of employers in certain notable particulars are representatives of the interests of employers, and the representatives of labor were officially recommended by the Executive Council of the American Federation of Labor and the Railway Brotherhoods, it will be generally recognized that the commission lacks men of such public prominence in this special field of inquiry as to give assurance that the enlightened public interest, which is the chief interest at stake in this most important task, will be adequately represented.

"President Taft himself, in his message to Congress recommending the creation of this commission, said, 'The time is ripe for a searching inquiry into the subject of industrial relations which shall be official, authoritative, balanced and well-rounded.' Whatever the excellence of the individual members, the commission as a whole, if confirmed by the Senate, will not in the eyes of the public meet this high hope."

It is the hope of the committee, that either the president will reconsider his nominations, or that the Senate will fail to confirm them.

## GREETING 1913 ALONG BROADWAY

Believing that the coming of a new year is an event of sufficient dignity to warrant a dignified and orderly celebration of it, a committee of thirteen citizens has taken steps to stop the street rowdyism which has for several years past characterized the night of December 31 in New York. They plan to inaugurate in its place, at a number of points throughout Manhattan Island, musical celebrations including band playing and singing to which everyone is invited and at which it is expected all will take an active part in ushering in the new year. So pronounced has become the public annoyance at the blowing of horns, flourishing of ticklers, and sprinkling of confetti which has heretofore usurped New York's out-of-doors observances on New Year's Eve that money to aid the new plan was quickly forthcoming. It is hoped to repeat the celebrations year after year. Indeed, those most enthusiastic in getting them up see possibilities of tapping untouched sources of public spirit by just such means. If the common emotions of so diverse a community as New York can be successfully brought to play upon an event that touches all alike, where is the limit, it is asked, to the uses that may be made of civic co-operation in the mass meeting, the parade and the pageant?

The appeal of the committee, issued by Jacob Riis, reads in part as follows:

"New York's manner of welcoming the New Year has come to be a kind of rough-housing that found its expression last year in the slogan we heard in the streets: 'To hell with the old year, hooray for the new!' We believe that our people are tired of this, and will be glad to join in a better and saner way more worthy of their city.

"To that end a New Year's Eve Committee has come together to arrange for music and singing of the old songs in two or three of the public squares along Broadway in the midnight hour. The people will be expected to join in the singing."

In commenting on the reasons for the appeal Mr. Riis said:

"Any one who has seen the crowds of rowdies on Broadway breaking hats and insulting women knows that a saner manner of celebration is desirable. We believe that the orderly element will join with us and take part in our midnight meetings. This will simplify the work of the police in curbing the disorderly element which always takes advantage of the occasion to mix in the crowds on Broadway.

"We expect to hold meetings in City Hall Park, Herald Square and Madison Square. Union Square will be turned over to the Salvation Army, which has announced that it will discontinue its meetings on street

corners throughout the city and assemble its singers there for the purpose of ushering in the new year. We hope that the idea, which is really a revival of the old custom of Christmas and New Year's 'waits,' will appeal to the public at large and attract sufficient attendance to make it popular."

The celebration at Madison Square will be held under the illuminated branches of a sixty-foot Christmas tree. Those who are giving this tree to the people of New York—represented by Mrs. J. B. Francis Herreshoff—have offered its use for that night to the committee who have no part in erecting it. It will be lighted for the first time just as the chimes ring out at 5:30 Christmas Eve and will shine forth every night until New Years. The lower branches spread twenty-five feet. The trunk is set in a concrete base and the whole tree will be illuminated by 1,200 electric bulbs, one to each foot of branch measurement.

The appeal is signed by Lyman Abbott, Felix Adler, John H. Finley, Frank Mason North, Silas McRee, Dr. George Alexander, Charles S. Whitman, William Jay Schieffelin, Rabbi Stephen S. Wise, Borough President George McAneny, Arthur Von Brieson, Allen Robinson and Jacob A. Riis.

#### A GOVERNOR, 360 CONVICTS AND THE LEASE SYSTEM

By pardoning 360 convicts from the state penitentiary on Tuesday of last week Governor George W. Donaghey, of Arkansas, undertook to strike a vital blow at the convict lease system of prison labor which exists in his state. Governor Donaghey was one of the executives who took part in the discussion of prison reform at the Governors Conference at Richmond, Va., a week or so before.<sup>1</sup> At that time he heard Governors Shafroth, of Colorado, Eberhardt, of Minnesota, and others denounce schemes by which some states realize large profits from the labor of prisoners, while the prisoners are subjected to treatment which not only can not reform but often actually stunts and brutalizes them.

In Arkansas the state, or its political divisions, leases convicts to private contractors at so much per day, and the contractor then proceeds in most cases to make the greatest possible profit out of their labor. At Richmond Governor Donaghey listened while Gov. Cole Bleese, of South Carolina, whose sensational remarks about lynching and the constitution were only a side issue to his main discussion, told how he had paroled some 400 prisoners and intended to parole 400 more. Governor Donaghey intimated that something of the sort could be expected from him when he returned home, but he gave

no hint of the wholesale character of his plans.

By his act last week three convict camps in Arkansas were practically wiped out of existence. These contained prisoners who had been leased to contractors. They did not include those building state roads. For the most part they were men who had been sentenced for minor felonies. The state was of course a party to the agreement by which these prisoners had been leased to private individuals and Governor Donaghey could not constitutionally violate that contract. There was no limit on his power, however, which prevented the pardoning of all the men working on a given contract. It was by doing that very thing that he sought to make it impossible for the present contracts to be carried out, and so to break down the whole lease system. It was a sensational way of calling public attention to the evils of private control of state convicts and so of paving the way to remedial state legislation.

Behind the governor's act is a history of repeated attempts on his part to arouse the people of the state to a demand for needed reform. In an explanation of his action, to be presented to the legislature next month, he says:

"I have consistently fought the convict lease system since I have been in public office. In every public speech I have denounced it. As a member of the Penitentiary Board I have opposed it in every instance where it was at issue. Time after time I have pleaded with the Legislature to abolish it, but in spite of my appeals for relief and the repeated protests of the people of this state and the reports of the penitentiary and the messages transmitted by the governor to the past two General Assemblies, all in condemnation of this cruel penitentiary and county farm lease system, no adequate relief has been given.

"The subject has been grossly neglected by the General Assembly, partly due to a confusion of ideas as to what plan was best to adopt, and partly due to a disposition by some to let the matter remain as it is, with the statement that 'The penitentiary was not designed for a Sunday school.'

"In answer to such statements, let me say, 'Nor was it designed for a revengeful hell.' The abuse of power shown by a few individuals acting as justices of the peace in some towns in Arkansas, as is made plain by the records, is enough to stagger into amazement those who have given the matter attention. Ever since the adjournment of the last legislature, without taking action upon the subject, I have had in mind in some way myself, to find some measure of remedy for the evil. But because of conditions which would materially disarrange matters so that the subject would have been hidden in a fog of confusion, I have been forced to delay action until this time, when all legitimate objections may be overcome and relief had."

Governor Donaghey cites ten instances which led him to strike a blow at the convict lease system.

<sup>1</sup>See THE SURVEY for December 21, page 347.

The first is a case in which two Negroes were sentenced to serve thirty-six and eighteen years respectively for forging orders for eighteen quarts of whiskey. Another is an instance in which a young white boy was compelled to work in the hot sun when he had a high fever, with the result that he died.

He then adds:

"My principal reason for discharging the large number at this time is for the purpose of forever breaking up the convict lease system in Arkansas. I would be untrue to my convictions, and, as I see it, untrue to the state's best interests, if I did not do everything in my power to bring about this result."

During the exhaustive studies which preceded the report of the United States Immigration Commission, two years ago, investigators for the commission visited the construction camps of Arkansas where state convicts worked under the control of private employers. Many of the things seen there were not published in the forty volumes of reports because they did not directly touch the problems of immigration, but Congressman William S. Bennett, of New York, who visited Little Rock and other points within the state for the commission, told a representative of *THE SURVEY* that his observations at that time convinced him that Governor Donaghey was entirely justified in letting 360 prisoners free at one time. Congressman Bennett added:

"I saw in one place a woman prisoner hoeing cotton under guard while pregnant. The buildings on the farm were utterly without such conveniences as one in her condition should have. Prisoners are often leased by a county judge to a contractor who pays the fine and costs of trial and then is allowed to recoup on the prisoner at the rate of twenty-five cents a day. One white man had been sentenced to \$10 fine and costs, which should not have amounted in all to more than \$13 or \$14. Yet after three months' work the man still had \$10 to work off. They had added to the legitimate costs such charges as the railroad fare of the prisoner and guards and other items."

When told of Governor Donaghey's act Governor Blease is quoted as declaring that the Arkansas executive had "laid him in the shade. Unless the coming session of the General Assembly abolishes the hosiery mill in the penitentiary, South Carolina can look out for an experience similar to that of Arkansas." He added: "The legislature better abolish that 'tuberculosis incubator,' or I will use the pardoning power to depopulate the penitentiary."

The hosiery mill is said to have been condemned by the State Board of Health.

### "SPUGS"

*To the tune of "In the Shadows."*

Remember  
This December,  
That love weighs more than gold!  
Help us spread the news to young and old;  
Friendship bought and sold  
Leaves the giver cold.  
The right gift  
Is the bright gift,  
The kind thought and cheer;  
Send your loving heart,  
That's the greatest part,  
So will Christmas crown all the year!

JOSEPHINE DASKAM BACON.

### THE CHRISTMAS SPIRIT OR THE CHRISTMAS GIFT?

The holidays are all near of kin, but it has taken the past few weeks to show that a sun-burned summer outing may be grandmother to the Christmas spirit. The genealogy runs something like this.

A thriving offspring of the "Vacation Lists" of summer boarding houses for working girls compiled by the Women's Department of the National Civic Federation is the Vacation Savings Fund. This fund was started in November, 1911, by forty-three working girls who found that a list of possible summer outings is only a Tantalus feast to a girl without a lump sum in hand to pay for board and railroad fare. Within the year the fund has had more than 6,000 contributors with deposits amounting to over \$300,000.

The savings fund holds social and business "evenings," and it was at one of these last month which was also the first birthday of the fund that a third generation of activities sprang into being—the "Spugs," which bid fair to eclipse their forebears, so rapid has been their growth and so well exploited have they been by the newspapers.

Mrs. August Belmont, a member of the executive committee, was the speaker on this anniversary night. Thousands of Americans know Mrs. Belmont best as Eleanor Robson and "Merely Mary Ann." The heroine of Zangwill's drama spoke on giving divorced from the spirit of good will. Especially before her working girl audience, she urged some sort of organized movement that would set itself against enforced contributions of working girls in the shape of gifts to employers and foremen. Mrs. Belmont argued against giving on the exchange basis or to keep up appearances and her talk ended with the suggestion that those present form a society called by some such

### MERRY XMAS

Xmas isn't costly gifts,  
But loving friendly hearts;  
Get four girls to think so,  
And a Spug Squad starts.

Xmas isn't cashing checks,  
But mistletoe and holly;  
Pick your Captain, buy your pins  
And join the Spugs so jolly.

Xmas wasn't meant for bribes  
To those who stand above you!  
Sign the Spug card—then you're free  
To give to those who love you.

Xmas makes too many cowards,  
So come on, Spugs, be sporty!  
Send your name and join the crowd  
At One-o-five West Forty.

JOSEPHINE DASKAM BACON.

name as the Society for the Prevention of Useless Giving. Then she went on, "If anyone asks you to sign a card or join in collective giving, say, 'I'm sorry I can't, I'm a Spug.'"

It was the name that got the society into the headlines and has kept its meetings in the newspapers ever since. Newspaper publicity has spread the idea so widely that cities in almost every state of the Union have started "Spugs." Those interested have not been working girls alone, for among its members the society numbers Theodore Roosevelt, Ben B. Lindsey, Kate Barnard, Josephine Dodge Daskam and Laura Jean Libbey. On the night of its inauguration 450 applied for membership.

Starting with this basis membership was rapidly increased in New York by a system of giving office (a "captainship"), carrying with it the honor of wearing green and red holly ribbon pinned on with a Spug pin to those who got four recruits. A big rally and ball on December 5 added to the membership so that at the present time in Greater New York alone the society has over 2,000 members, men and women. In January it is proposed to hold another rally and take stock of the results of the agitation in actually cutting down useless giving.

Besides Mrs. Belmont, who is president, the officers of the society are Miss Robinson Smith, vice president; Anne Morgan, treasurer and chairman of the Propaganda Committee and Miriam K. Oliver, secretary.

The Spugs have produced some spirited leaflet literature, verse and prose, some of which are reproduced here. The following is their declaration of faith:

1. Believe that it is foolish to join in giving Christmas presents to those higher up.

2. Believe that it is vulgar to give Christmas presents because they are given to you.

3. Believe that it is wicked to give Christmas presents without love and common sense.

4. Get at least four others to share this belief and be a Spug Squad.

5. Choose a captain of this squad to send in your names to the office at 105 West 40th Street.

6. Get membership cards and Spug buttons.

7. You are now full-fledged Spugs. Make as many converts as possible, and show the world that "Good-will to men" will bring "Peace on earth" without money rivalry.

## THE INDUSTRIAL RELATIONS COMMISSION

PAUL U. KELLOGG

"Disappointed and disgusted," wired one of the leading economists of the middle West. "It will be the Industrial Commission (with Penrose at the head) over again. I will not be a party to another capitalistic humbug." "The commission lacks weight; will fail to carry conviction; money wasted, better none," read another telegram, over a name which means as much in the field of labor as that of Dean Liberty H. Bailey in scientific farming or of the Mayo brothers in surgery. "The President faced the great constructive opportunity of his term, and he hands us, pardon me, a lemon," said an East Side social worker who has helped settle a score of strikes. None of these three men were candidates for positions on the Commission on Industrial Relations. What they said puts tersely the general reaction felt at the appointments presented by President Taft last week for confirmation by the Senate.

To understand this recoil it is necessary to go back to the inception of the movement which culminated in the passage of the Hughes-Borah bill last August. It has been from the start a movement calling for a new approach to the problem of industrial relations; not for a reiteration of what has long been said on the subject of conciliation and arbitration; but for fresh and resourceful investigation from a newer point of view, based on the changes in our industrial life within recent years. "Such a survey," as Senator Root said at the outset, "can only be made by the most capable and best-informed men in the nation."

The proposal of a commission came from neither side of the industrial cleavage, but from a non-combatant, although at the same time non-quiescent, element in the community,—from social workers, economists, professional men, who were not only on vantage ground to make such a non-partisan proposal, but who saw the constructive opportunity before a commission with as great scientific competence, staff, resources, and power to compel testimony as the Anthracite Strike Commission.

Such a piece of work could not be undertaken by a jury; the board of inquiry must include those elements in the industrial life which have a great and immediate stake in the outcome of labor adjustments; but it should also include those general elements in the community which, with respect to adjustments in any trade, have as great a stake if not so immediate a one as the bargainers themselves. Therefore the committee drafted legislation which called for equal groups of employers and employes on the commission, and for a third group which would conceivably represent the public. And it was urged that in the make up of each group the appointees should represent not a faction or section, but be as far as possible representative of the whole range of parties at interest.

How far do the President's nominations measure up to such a standard?

The group of employers draws on mining, railroading and manufacture; it includes two engineers, who are accustomed to look at the structural elements in industry. One of them, Mr. Schwedtmann, has been the forceful and progressive leader in the workmen's compensation and accident prevention campaign which has been carried on the last few years within and by the National Manufacturers' Association and which at every point has emphasized the human element in industry. Mr. Lewisohn brings the more detached point of view of the large investor and director, rather than the immediate personal equations of a manager. "The appointment of Mr. Delano," writes a civic leader in Chicago, "as the representative of capital, is fine and fair, and ought to be the type of appointment throughout." If there is inadequacy in the list of employes, it is because to a degree they duplicate one another's points of excellence, with perhaps the natural result that other points are lacking. For example, the chief spokesmen of the National Manufacturers' Association have been bitterly hostile to organized labor. While union men today regard Mr. Delano as fair-minded, they recall that as a young man in the engineering office of the Burlington railroad, he personally went out and took a striker's place in that great and bitter struggle. There is no one in the employers' group who has stood head and shoulders above his fellow employers in insisting on the preservation of the spirit of democracy in industry.

With the employers' group of this capacity and calibre, it is all the more important that the trade union group should reflect not only the firmly established labor circles, but also the nascent movements which are abroad.

Mr. Garretson represents one of the great railroad brotherhoods which on all hands it would be agreed should have place on the commission—capable, craft-unionism at its best. There also would be acquiescence that the American Fed-

eration of Labor, which is the national organization of the dominant union movement in America, should similarly hold place—but not to the exclusion of any real representative of the 6,000,000 women workers whose labor problems lie not merely in their relations with employers, but in their relations with men's unions. The commission is to investigate the causes of industrial unrest. How absurd, therefore, that there should be no one on it who has the least sympathy with, or understanding of, the new industrial unionism which is the dynamic element in the expression of that unrest.

Mr. Lennon was long an executive official of the journeymen tailors' union, but was defeated two years ago. The same thing is true of Mr. O'Connell and the machinists' union. Neither was sent to the Rochester convention as a delegate of his own international. Each represents a minority following in his own trade. To name them as the sole representatives of organized labor outside the brotherhoods would be as if President-elect Wilson should draw his cabinet exclusively from the Taggart-Sullivan-Murphy machines, and not at all from the progressive elements in the party which nominated and elected him.

With employers and employes thus represented, the make-up of the third group, if the commission is to at all fulfill the great purpose for which it was conceived, is crucial. Here we do not find the leaven which has been at work in public discussion, in industrial research, in social movements, and the faculties of political science. It is a detail that no one of the forty-one signers of the original petition to President Taft was named as a member of the commission; it is significant that the list includes no one who would instantly be considered like-minded with them, or who has made the whole range of economic problems to come before the commission the subject of fundamental study and observation. Freund, Brandeis, Commons,—there is no name that rings out like these in the list. It is not the inclination of the Industrial Relations Committee to disparage any of the men named. It is as a group that it believes the board of inquiry to be wholly inadequate. Ripe knowledge of constitutional law, long experience in the federal courts, were criteria which President Taft as a lawyer quickly recognized in making appointments during his term to the federal supreme bench, quite apart from any other qualities. He has shown no such discrimination here.

Secretary Nagel, representing the administration, has said repeatedly that the work of this commission would either be exceedingly important or else worse than wasted. If the Senate refuses to confirm the President's appointments, it will help mightily toward staving off the second outcome.

## "THE ART OF GIVING"

CARL KELSEY

J. P. LICHTENBERGER

University of Pennsylvania

*"Yet, cease not to give  
Without any regard;  
Though the beggars be wicked  
Thou shalt have thy reward."*

Such is the jingle coming down to us from "Merrie England" of long ago. A visitor at the session of the American Academy of Political and Social Science held on November 19 at Philadelphia would have been struck by the radically different philosophy which characterized each address. It seems odd, when one thinks of it, that in spite of the enormous giving to all sorts of agencies, this was perhaps the first public meeting to discuss the effects of public giving and its possible regulation.

The afternoon session was held at City Hall with Robert Fulton Cutting of New York as presiding officer. The subject for this session was: Should any limitations be placed on the purpose, life and amount of private benefactions? and the chief address was given by W. H. Allen, director of the Bureau of Municipal Research of New York City. To quote Mr. Allen:

"Last year large gifts of nearly \$267,000,000 were heralded broadcast in our newspapers. For twelve years the total of notable gifts has exceeded \$100,000,000 a year. To this total of special gifts by a handful of princely givers should be added not less than another \$100,000,000 yearly in small amounts, given as intended benefaction—apart from other scores of millions in taxes and in unearned increment remitted on private philanthropies.

"This truly princely giving is bound to increase. Within the next ten or fifteen years from two to four billion dollars will be given

in large sums to organized private charitable, religious, social and educational agencies.

"Any expenditure on so huge a scale needs to be justified. The sum of \$267,000,000 means a year's earnings of 270,000 families, which means 270,000 families deflected from industries for one whole year or the permanent deflection from industry of 12,600 families. The presumption is against, not for, such deflection. Whether this princely giving is a national resource or a national drain, asset or liability, is of momentous concern to 100,000,000 people and their successors.

"Of no other comparable investment or resource is there so little effort to discover the laws of effectiveness. The large amounts given every year exceed more than twice the trade of the United States with China, more than the annual imports from Canada, and almost equal our sales to France. They are more than the maximum annual exports of the Standard Oil Company, whose operations kept the world agog for twenty-five years and efforts to control which set new standards for private business and public restriction of such business.

"People will up to or down to, as trustees manage up to or down to, public expectation of will makers and endowment managers. The quickest way to influence will making and endowment managing is to influence general public sentiment by giving the public facts and thus getting "into the air" high standards of expectation from those who spend their own or other people's money for benevolent purposes. Heretofore the public has supinely accepted rules of etiquette which make it seem indelicate to question the result of private giving. Conceding the social motive of givers we have hesitated to believe that their results were anti-social. So it is possible in Philadelphia, as in other cities, for a man to spend millions or hundreds of thousands in perpetuating obsolete forms of philanthropy without a voice being raised to warn other phil-

anthropists that their intended *benefactions* may prove to be *mal-factions*, actually obstructing social progress and creating social problems.

"Until the public thinks about will making and endowment managing in an impersonal way the prospective will-maker or donor will never see himself as others see him. We do not like to offend men and women who are able to give largely. If we are in the appealing class, we come to believe that we can get more money by applauding large gifts indiscriminately than by looking a gift horse in the mouth. Thus, the very people who are best able to criticise or suggest, because closest to needs not yet met, are prohibited by self interest or a sense of propriety from giving to the public the benefit of their inside knowledge.

"A lawyer one day remembered on a street car that he was about to draw a will for a man wishing to leave \$3,000,000 for public purposes. He asked the president of an organization to give him some advice whereupon a report of 200 pages descriptive of a certain society's work was sent him. Is there any other business on the face of the earth that would treat a prospective \$3,000,000 bargain so casually? On the other hand is there any other business on the face of the earth but will making in which a man wishing to invest \$3,000,000 would limit his inquiries to two or three acquaintances? Nor is there any other vocation but philanthropy where a man decides in the midst of a dinner conversation to back some other person's pet investment with \$500,000 or \$1,000,000.

"Without defending the dead hand I want to recall two facts: (1) that what is really objected to is not the deadness of the hand, but the deadening effect upon trustees, beneficiary and other donors; (2) that a deadening effect is just as deadening from a live hand as from a dead hand. There is no kind of deadening that deadens more fatally than the sympathetic live hand which from misinformation and lack of efficiency standards invites insincerity, evasion, waste, incompetence and incompleteness in the use of its gifts. Energy can be deadened by riches as well as by restrictions.

"Because I agree with Julius Rosenwald of Chicago (1) that no man can see further than twenty years ahead; (2) that posterity has a right to problems; and (3) that perpetual endowment often creates problems, I offer the following suggestions:

" 1 The amount of endowment in hand should be annually reported, with a clear statement of the purposes and restrictions of each distinct part of the total endowment.

" 2 Use made of the total endowment and each part of it should be clearly reported each year in such detail as to show efficiency of use as well as purpose.

" 3 An annual outside independent audit should be made—and results published—of all endowment receipts and endowment expenditures showing the nature of investments, the amount of interest yielded, extent and purposes for which income or capital is consumed, etc.

" 4 If it costs the income on \$20,000 a year to

maintain a hospital bed, givers should not be told that they can "endow" that bed for \$5,000.

" 5 When endowments exceed the amounts needed that fact should be advertised to prospective givers and to all others who may know of needs not met of the kind for which the endowment was intended.

" 6 Endowments should be used for special purposes, experiments and extensions of work so as to encourage not inhibit current giving for current maintenance.

" 7 'Endowment instruction' should be given through annual reports, letters, conferences, speeches and frank discussion at all times of the principles and methods of efficient endowing.

" 8 Endowments should be refused when so restricted so as to weaken the appealing power, increase the burden or paralyze initiative.

" 9 How different additions to endowment would add to service should be reported.

"10 Agencies should print forms of bequest in their annual reports which will suggest different forms for permanent funds, current expense funds and special purposes.

"11 For all institutions of a class and for all institutions of all classes a list of all endowments should be published annually by whatever public or private agency most nearly approximates a local clearing house.

"12 As a protection to society, to philanthropic and educational agencies and to donors, state boards of charities should be given power by statute to require and to publish a detailed explanation of the status of all private endowment funds, other than for colleges, etc., receipts, disbursements, extent and purposes for which income or capital is consumed, etc., state boards of education should be given similar powers and duties with respect to strictly institutional educational endowments.

"With respect to will making, I venture the following propositions:

" 1 If not subjected to systematic education in giving, the passing generation, so far as it bequeaths money to public causes, tends to bequeath it to causes dominant in its youth or early prime.

" 2 When a man sits down to make his will it is too late to accomplish much with him because then he will act, as a rule, consistently with the indifference or the intelligence with which he has been considering public questions and his own responsibility for the past ten or twenty-five years.

" 3 No legacy should be restricted as to purpose beyond ten years.

" 4 No temporary restrictions are to be imposed beyond ten or at most twenty-five years because society changes too rapidly and should not harbor incomes which welcome any form of distress as the only means of using legacies.

" 5 If temporary restrictions are to be imposed,

- money should be given to the least popular or less popular rather than to the most popular aspect of a beneficiary's work. A relief society needs its need for coal quite as much as the coal; to relieve it of the appealing power that grows out of this need may reduce its total contributions by many times the value of the coal.
- "6 Unrestricted legacies should be given upon condition that an annual accounting be made for use of income and principal.
- "7 Holding the principal intact and permitting the use of income only for a term of years will generally be more helpful to the beneficiary than an entirely unrestricted legacy.
- "8 Societies that pray for bequests may accustom will-makers to demand statements of fact rather than personal preference when asking for advice.
- "9 A list of alternatives should always be available for givers and advisors.
- "10 A consolidated statement of community needs not yet met should be advertised by perhaps such co-operation among benevolent agencies as when business men in a city unite to advertise their city's attractions.
- "11 Every city needs experts on will-making, not only to draft unbreakable wills but to submit unquestionable needs.
- "12 State laws should make it easier for trustees of funds no longer needed to transfer such funds to purposes which will promote the public wealth.
- "13 The state should provide for the automatic examination of all trust funds at the end of every eighteen years and two years' notice of discontinuance for such funds as are no longer serving a public purpose. The funds should revert to the public unless applied to public betterment purposes approved by the state authority.
- "14 Wills might profitably ask the state or municipality to reassign for periods of five or ten or twenty years what remains of restricted or unrestricted legacies after the expiration of five, ten or twenty years.
- "15 Some testator or donor should experiment with alternating endowments; that is, income to go to one agency for ten years, to be passed to a second for ten years, either to return to the first or to go to a third for the next ten years, etc. This, I believe would do better than the suggestion of Mr. Rosenwald that all endowments be limited and be compulsorily consumed within twenty or thirty years.
- "16 Another experiment is needed, namely, giving to institutions during the minority of personal heirs the income on funds held in trust for such heirs, thus reverting a frequent practice of giving to institutions after personal heirs have died.
- "17 A premium should be put upon providing for needs not met rather than merely adding to the endowments of 'established agencies' or 'going concerns.'
- "18 The most efficient will-maker will not forget that he is a citizen before he is a philanthropist and will so give his money that he will effectively supplement rather than disregard the work which his community, through government agencies, has pledged to do.
- "19 The maximum amount of endowments or legacies should not be limited except as progressive inheritance or transfer taxes will automatically limit the amount which actually may be transferred or devised. While it is conceded that some great endowments would yield appropriations which if mismanaged would menace the country's welfare it is also clear to me that the efficient use of a \$100,000,000 endowment out in the daylight will always be safer for society than the inefficient use of \$20,000,000 or \$10,000,000 or even \$1,000,000 in ways the public does not understand. The only restriction upon the use of endowments which society will ever learn to use progressively for its own advantage is the restriction as to publicity, i. e., annual accounting as is provided in the proposed charter for the Rockefeller Foundation. So important is this step that I once suggested to Mr. Rockefeller to endow an organ to discuss objectively Mr. Rockefeller's own giving.
- "20 The education of the public to higher standards of efficiency in giving and in endowment managing requires the establishment of local and national clearing houses, such as Mrs. Harriman has proposed, where appeals will be scientifically studied from society's point of view, to which givers may come for help and study their own appeals and for facts to approve of their rejection and their giving. Unless such clearing houses are established there is grave menace in America's princely giving and in its small giving. The time has come to assert the truth that the efficient use of funds in industry will help society more than the inefficient use of funds in philanthropy."
- A long discussion followed, by E. D. Solenberger of the Pennsylvania Children's Aid Society; W. B. Buck of the Sybert Estate; Rev. S. H. Cox of the Congregational Church; Dr. W. H. Maltbie of John Hopkins; Mr. Cushman of the East Side Settlement, New York; Charles N. Williams of the Cleveland Chamber of Commerce; Isaac Gimbel, the Philadelphia merchant, Samuel S. Fels, the manufacturer and others. Various speakers brought out different aspects of interest, but there was a striking lack of any sharp difference of opinion. Among the suggestions were these: that there should be developed some way of influencing donations and bequests to philanthropic agencies to avoid the development of needless institutions, to prevent overlapping and to make sure that all the different needs are met; that attention be given the education of the giver of small amounts, as the

average organization is supported by a multitude of small givers rather than a few large benefactors; that there should be public supervision of the administration of various endowments; that some more flexible system is needed to enable the changing of the older agencies to meet newer social conditions; that as those who are able to give are troubled and perplexed by the multitude of appeals coming from all directions, it would seem as if some common service of inquiry and advice might be effected which would minimize this burden.

The speakers were evidently somewhat reluctant to say whether these ends would require public or private action or both. One got the impression that it was felt to be a bit premature to suggest methods or agencies. The first thing is to drive home the realization of the necessity for action.

The evening session was held in the Witherpoon Building and was presided over by Robert W. de Forest, vice-president of the Russell Sage Foundation.

In his opening remarks Mr. de Forest said:

"To discuss this question intelligently, there must be first eliminated from consideration any accidental circumstances which might confuse the issue, because of the personality of the giver or the purpose of the gift, and to discuss it practically in its relation to American benefactions we must discuss it under certain postulates of American organic law.

"Therefore, the question of tonight, stripped of all extrinsic elements, is this: 'Assuming no objection to the person of the giver or the object of the gift, and assuming also reservation to the state or nation of the power to alter, amend or annul the charter of any corporation which is to hold and apply the gift, should any limitation be placed on the purpose, life and amount of private benefactions?' It seems to me that the question in this form answers itself with an emphatic negative."

Mr. de Forest pointed out that present public opinion would put no limit on the purpose, life and amount of private benefactions, so long as these are safeguarded by the general right to amend and repeal charters, which right is inherent and vested in the supreme court.

"There is no country in the world where private benefactions have been so generous as in ours. There is no time in the history of our country when there have been so many and on so magnificent a scale as now. Let us give full swing to the favoring current, holding as we do, by our reserved power over all corporations we create, the opportunity to direct that current, and let us not seek to hem it in or dam it up by any obstruction which might divert the stream into other channels not beneficent, or perhaps dry up its springs at their source."

Edward T. Devine spoke at some length and elaborated the following propositions:

1. The giver and the doer are partners. It is not true that you can buy brains to do anything that you are willing to pay for, or, on the other hand, that if you have an idea, you can get money from some generous or gullible individual to carry it out, regardless of its merits. Financial support and executive efficiency are both indispensable.

2. Benefactions are needed; they are in line with sound public policy and should be encouraged.

3. The value of a benefaction does not depend entirely on its amount or on the ability with which it is administered. Its value depends also on whether the purpose to which it is to be devoted is really an important purpose. In other words, the benefactor is responsible for making a wise decision among the various things to which he might give. Public policy—to be enforced not by legislation but by educated public opinion—demands ability to seize upon the really important things and to support them.

4. A gift of money for a specific purpose does not confer upon the donor the right to decide questions in other fields than those in which he is making his contribution. For example, to furnish money to pension teachers does not involve the right and should not involve the power of deciding educational policies.

5. Endowment should not be perpetual, but should be limited roughly to the generation of the benefactor, or at least to such a period as can reasonably be forecast.

6. Exemption from taxation and other considerations justify public participation in the administration of great benefactions.

7. Income from taxation may be relied upon as a corrective of any abuses of private benefactions. That is, if benefactions are apt to be given by men of advanced years and conservative instincts and to be administered in such a way as to support traditional rather than progressive ideas, money which is raised by taxation and secured by annual appropriations may be expected to be devoted more largely to the particular things in which the people of the present and coming generation are especially interested. It may be a question whether this is or is not a sufficient corrective, and whether it really operates as I have just indicated or in the contrary direction to strengthen any tendencies in private benefactions.

8. Attention should be given to the relative advantages of federal as compared to state incorporation for foundations or institutions affecting national interests.

Edwin S. Stuart, ex-governor of Pennsylvania, discussed briefly the Stephen Girard Estate as a public benefaction administered by the city of Philadelphia until 1869, when an act of assembly was passed, placing the fund in the hands of fifteen trustees to be appointed by the Common Pleas Courts of Philadelphia County, the mayor and the president of Common Councils to be ex-officio members. He commented at some length upon the efficiency of the management of

this estate because of the careful management and the pace set by the men who organized the first board of city trusts.

As to the matter of limitations, he suggested "that we cannot look a gift horse in the mouth but more care and thought should be given by those who are going to leave a large amount to benefactions. If there is some limitation in the endowment by which this money can not be used in ten years or forty years, there ought to be some way in which it could be used for some other purpose that would be of as much value as if the donor were himself alive and might direct its use."

Robert Fulton Cutting, in speaking of the topic as an outgrowth of the great benefactions of Mr. Rockefeller, Mr. Carnegie, Mrs. Sage, Mr. Morgan and others, said:

"It seems to me that while there have been certain idiosyncrasies of giving that have greatly detracted from the potency of gifts, it is far better to go on allowing these idiosyncrasies than to disturb the confidence of the givers.

"No immediate time limitation should be placed on endowments—for one reason that has been overlooked. There are thousands of givers who feel that by creating some family institution they are projecting their own spirit of benevolence over their descendants. This leads us certainly to believe that no limitation should be placed upon benefactions of this kind. It seems to me that one of the reasons why we cannot afford just now to take any regulative action is because we owe it to the general public to set before it the grand and noble ideal of philanthropy. What we want to do is to make a larger appeal to imagination, to throw upon the screen a larger and more impressive panorama of active work that will so appeal to the imagination of the givers that they will put into the hands of organizations competent to administer them, such bequests as they wish to make.

"In Switzerland, local organizations, while autonomous, are federated into cantonal and national bodies. The Society for Promoting Public Welfare in Basel conducts or subsidizes and influences more than fifty expedients covering the whole ground of the promotion of thrift. This appeals to the patriotic as well as to the charitable sentiment. Such organizations serve to educate testators. But there is still a grander ideal. It is the dream of Democracy to make the government the greatest agency of social betterment, and as such to become the treasury for beneficence."

Julius Rosenwald of Chicago, who on his fiftieth birthday made gifts to the amount of \$687,500 took the positive ground that every age had its own needs which private benefactions should serve. He said:

"I am opposed to the permanent or what might be styled the never-ending endowment. Permanent endowment tends to lessen the amount available for immediate needs; and our imme-

diante needs are too plain and too urgent to allow us to do the work of future generations."

He favored self-distributing endowments which disburse not only the interest but also a portion of the principal annually; an endowment so ordered that it would consume the principal during fifteen to twenty years, and would yield during that period double the amount annually which it would yield if the principal were left intact and the interest therefrom only used.

"It is fair to assume that on account of the increased income more effective work would be done thereby, attracting other endowments as well as entitling the beneficiary to greater general support. If a continuation of the work appears to be advisable, it is fair to assume that a satisfactory record would be the key to treasure boxes of additional funds. Necessary and deserving philanthropic enterprises will continue to be supported in accordance with the need of their day."

J. D. Green, representing the Rockefeller Foundation, the last speaker on the program, expressed the opinion that it is to the public interest that the greatest possible variety in philanthropic giving should be encouraged. Only by such variety and the experience resulting therefrom will the wisest methods of giving to the worthiest objects be discovered. Experience has shown and will show, however, that certain limitations are desirable, however inexpedient it may be to enforce them by public authority. One lesson of such experience is likely to be that it is usually unwise to set up between the giver and the recipient institution a relation of continuing financial dependence. Nor should there be responsibility and authority for direct management. The recipient of a gift should not be asked or expected to relinquish the dispositive function in matters of policy which naturally appertains to that of trusteeship. Every permanent endowment should carry with it some provision offering to future generations protection from the baneful influences of the dead hand. There should be some way of insuring so far as it is humanly possible, that management of the trust shall always be responsible to the best wisdom of its time.

Summarizing the discussion of the evening session, three general ideas may be noted: that each generation has its own imperative needs and that giving should not be of such character as to jeopardize these immediate needs; that these needs may be best supplied by the cultivation of generous giving, and care should be exercised in any method of public direction so as not to dry up its sources; that as time passes the state should exercise its discretionary power of altering charters as future needs may require so that the real purpose of the giver may be conserved.

# THE NIGHTS BEFORE CHRISTMAS

CORDELIA WILLIAMS  
NATIONAL CHILD LABOR COMMITTEE

**D**OLLY dear, dolly dear, where have you been?  
"I've been in a world you never have seen."  
Dolly dear, dolly dear, how came you there?  
"I was born in a tenement, up a back-stair."

Dolly, my dolly dear, what did you see?  
"I saw little children make dollies like me."  
How old were these motherkins, when did they play?  
"They don't play in that world, they work every day."

Dolly, but dolly, how long does it take?  
"They nodded, we nodded, that night half awake."  
Why didn't they feed you and take you to bed?  
"The children who made me were often unfed."

Dolly, oh dolly dear, what were they named?  
"There was Nettie with measles, and Rosalie lamed."  
These sick little children, what could they sew?  
"They stitched on my dresses, an arm, then a toe."

Dolly mine, dolly mine, who brought you here?  
"I was squeezed in a box and fainted from fear."  
Perhaps it was Santa in one of his sleighs—  
"Twas a bit of a boy who dodged past the drays."

\* \* \*

"Santa Claus, Santa Claus"—save us, he snores!  
"The children are weary at doing your chores!  
Hasten like Blitzen with all your reindeer,  
To stamp out this traffic in holiday cheer."

Lovers of Christmas, pledge you with me  
A pledge to the new year on bended knee,  
That dollies of sawdust shan't witness again  
To these stones in the hearts of the children of men.

## HOME WORK

During the past year the New York State Factory Investigating Commission has been studying the piece work sent out from certain lines of factories to be performed by tenement women and children.

Some of this work has to be carried on under special tenement house licenses; some does not. It is almost impossible to enforce factory, sanitary, or child labor laws in such home workshops and there is an aggressive movement to abolish home work altogether.

The state investigation has revealed these facts as to 204 homes:

25 per cent of the workers were under ten years old.

45 per cent were under fourteen years.

60 per cent were under sixteen years.

75 per cent of the families earned less than ten cents an hour all working together.

*Courtesy of National Child Labor Committee.*

The upper picture shows a tenement family sewing the stuffed legs on "Campbell kids." The photograph was taken last year and was printed in the New York newspapers. The manufacturer who gave them the work was angry about the matter and took it away from them. This year the same family was found working on underwear.

Carmella (aged nine), Rosie (aged eleven), both of whom testified before the New York State Factory Investigating Commission, together with little Conchetta (aged three), earn three cents a dozen by running ribbons in corset covers. Their mother earns twice that amount tacking in the ribbons and sewing on thirty-six buttons. Their father is blind.

This little Carmella told Miss Watson of the commission: "I have no time for play. When I go home from school I help my mother. Half hour I make my lessons. Every morning I get up at six o'clock. I go to bed at eleven o'clock."

## BOOKS

### HUMANLY SPEAKING

By SAMUEL MCCORD CROTHERS. Houghton Mifflin Company. 216 pp. Price \$1.25; by mail of THE SURVEY \$1.35.

A new book of essays by Mr. Crothers is one of the delightful happenings which do not come as often as we could wish. It is nearly two years since he gave us *Among Friends*. *Humanly Speaking* is in the true line of succession and will be warmly welcomed by the many who first found in *The Gentle Reader* the most charming mingling of acute observation, human kindness and wise philosophy, all overlaid and irradiated by the finest and quaintest humor which has been given to booklovers in the present century or, indeed, since the passing of the gentle Elia. A cultured Englishwoman when introduced to *The Gentle Reader* and *The Pardoner's Wallet*, said: "Mr. Crothers must be one of Charles Lamb's dream children."

In the first essay, which gives its name to the book, Mr. Crothers introduces us to a new, or forgotten, virtue and asks us to practice it. He calls it, after Sir Horace Walpole, "Serendipity," and it means a certain accidental sagacity, by which when we are seeking for one thing, or merely going on our way, we happen upon or discover something else for which we were not looking. He himself practices the virtue and gives us examples of it. "That the old order is passing is obvious enough. That a new order is arising and that it is, on the whole, beneficent is not merely a pious hope. It is more than this; it is a matter of observation to anyone with a moderate degree of serendipity."

The quotation above might be taken as the keynote of Mr. Crothers' social philosophy. We find it in the essays on *The Spoiled Children of Civilization*, on *The American Temperament* and *To a Citizen of the Old School*. Here is a passage in that vein. "This is what the 'social unrest' means in America. It is not the unrest of the weak and the unsuccessful. It is the unrest of the strong and ambitious. You cannot still it by talking about prosperity—of course, we are prosperous, after a fashion, but it is a fashion that no longer pleases us. We want something better and we propose to get it."

Again he says, "I agree with you that if we are to have any constructive work in American society, the first thing to do is to get rid of the man with a muck-rake and put in his place the man with a vision."

In the essay, *The Unaccustomed Ears of Europe*, he gives us insight into modern English conditions. "This is not the England of Sir Roger de Coverley, with its cheerful contentment with the actual and its deference for all sorts of dignitaries. It is not in its present temper a model of propriety. But in my judgment it is all the more interesting and full of hope. To say that England is in the midst of a revolution is not to say that some dreadful disaster is impending. It only means that this is a time when events move rapidly and when pre-

cedents count for little. But it is a time when common sense and courage and energy count for a great deal and there is no evidence that these qualities are lacking."

Two of the essays, that on *The Obviousness of Dickens* and the one on *Realism as an Investment*, are devoted to purely literary criticism of two different kinds of realism in fiction. The latter is a quaint comparison of reality-in-fiction with reality in business. "Your novel is a carefully prepared structure and must have cost a great deal, but it is built on ground which is not worth enough to justify the investment. It has not what we call 'site value.'"

These essays, like those in the volumes that come before, have the pleasant quality of wear-resistance. After you have read the book through a time or two and have got to know the essays well, you can pick it up in odd moments, open it on any page, and still read with interest as great as on its first perusal. You can practice "serendipity" on every page. At the tenth or twentieth reading you will notice something new, or see it in a new light.

ALEXANDER JOHNSON.

### THE FAMILY IN ITS SOCIOLOGICAL ASPECTS

By JAMES Q. DEALEY. Houghton Mifflin Company. 136 pp. Price \$.75; by mail of THE SURVEY \$.81.

### HISTORICAL SOCIOLOGY

By FRANK GRANGER. Methuen & Co., London, E. P. Dutton & Co., agents. 241 pp. Price \$1.35; by mail of THE SURVEY \$1.44.

### SOCIOLOGY IN ITS PSYCHOLOGICAL ASPECTS

By CHARLES A. ELLWOOD. D. Appleton & Co. 417 pp. Price \$3.00; by mail of THE SURVEY \$3.13.

Foresight and hindsight are helpful not only to the prophet and the historian but to any profession. The social worker peculiarly needs another kind of vision which might be called "round-sight"—the power of seeing around daily work so that it appears in its perspective and larger relations to the world. Even if social work is not to be classed as a dangerous trade, as Dr. Cabot proposes more or less seriously, there is no doubt that both the health and the personality of the social worker are often in danger of being swamped in the mass of human details which are interesting, appealing, compelling, and which are likely to bind the worker within a perilously small circle of thought.

Books like those of Professor Ellwood and Professor Dealey are excellent antidotes to this tendency. Professor Dealey's study of the family in its sociological aspects should enable friendly visitors and other social workers to see, in full historical perspective, the family problems with which they are constantly dealing. The primitive family, the matronymic stage, the patriarchal stage, and the various phases of the modern family are taken up in an orderly and succinct way. One may get much out of this little book of 134 pages. Professor Dealey's discussion of present-day family problems, as influenced by American democracy and by conditions in great cities, is clearly put,

sane, and permeated by a healthy ethical sense. What he says about divorce will bear especially careful reading by social workers, and most of them are likely to agree with his conclusions, which are considerably influenced by our new, and as yet little diffused, knowledge of the shocking influence of venereal disease upon the marriage state:

"A marriage, in other words, is sanctified only when the parties to the contract are themselves fit bodily and spiritually for a holy ceremony and remain so throughout life. Nor should churches place themselves in opposition to divorce so long as they unite in what should be a holy marriage the pure and innocent with the impure and defiled. When churches refuse to marry those unfit for conjugal and parental relations, then they may with a good conscience insist on a permanent marriage tie. The state also will, as public opinion develops, assume the same attitude, and make sound physical and moral health a pre-requisite for a legal marriage."

\* \* \*

The utterances of a professorial Englishman, who is horrified by ideas to which he was not brought up, will not have a vital message for either sociologist or social worker in America. Professor Granger's *Historical Sociology* is not without its points of interest, but few readers of *THE SURVEY* are likely to give time to it.

\* \* \*

Professor Ellwood's book is probably the best elementary treatise on sociology for the social worker. It is more definitely in line with his professional needs than is Professor Giddings' "Elements," is less sketchy than Ross' works, though not so readable, and is much more up-to-date than the widely-distributed text book of Small and Vincent. There is meat in the volume, although the 400 odd pages could have been cut 20 per cent by judicious eliminations. Those who have been trained in the old psychology, with its sharply cut categories of sensation, perception, reasoning, etc., will find Professor Ellwood to present a new world in the modern psychology of James and Thorndike, which enables us to understand human minds as products of biological evolution. Of particular value will be the chapter on instinct and its rôle in social life. Most social workers are prone to think of people as under the control of reason, and to fail to interpret actions—even of their professional "cases"—in terms of feelings and of native impulses which run down to roots deep in the past history of the race.

Those who take up Professor Ellwood to find definite prescriptions for social reform deserve to be disappointed. The sociologist draws architect's plans—it is the social workers who are builders. Sociologists, materialists, idealists, and eugenists will all be irritated at Professor Ellwood because he puts their favorite "ism" into a niche in the wall, refusing to let it stand in the center of the edifice. If this is a defect, it is also a great merit in books of this kind—they fail to lead us to definite conclusions, but

they stimulate us to draw our own. The thoughtful social worker who is daily wrestling with human beings ought to find in psychological sociology, as Ellwood presents it, a theory of human nature which will lend interest and intellectual dignity to his practical service.

MICHAEL M. DAVIS, JR.

#### WOMEN IN THE BOOKBINDING TRADE

By MARY VAN KLEECK, secretary Committee on Women's Work, Russell Sage Foundation. *Survey Associates, Inc.* 300 pp. By mail of *THE SURVEY*, \$1.50 postpaid.

In this volume Miss Van Kleeck records the results of an intensive study of the employment of women in the bookbinding trade beginning in 1908. It is a careful and interesting statement of current conditions based upon visits to establishments and to the homes of workers. It sheds much light upon the chaotic conditions in the trade, the absence of standards of wages, hours and sanitary conditions. It reveals the defenseless position of the workers, so far as New York state is concerned, in the absence of a workmen's compensation law, a statutory closing hour at night, and a minimum wage law. There are enlightening instances of the results, in human suffering, of this absence of needed legislative safeguards.

Miss Van Kleeck gives an account of the bindery women's union in New York, the largest local union of women in this trade in the country, and shows the intelligent, persistent effort made by the unions, local and national, to afford to their members through trade organization that protection which the state of New York cruelly fails to give them.

The chapter on Teaching Girls the Trade is profitable reading particularly for persons actively interested in vocational guidance.

The foundation of the work is somewhat slight. The establishments visited and the girls interviewed were too few for much generalization to rest upon them. Statements as to wages appear not to rest on pay rolls, and the author is accordingly wisely cautious in her statements.

The bookbinding trade in New York is of national and international significance. This is not by reason of its invested capital or the number of its employes, but because in it arose the Williams case, in the course whereof the New York Court of Appeals promulgated a decision that placed the greatest manufacturing state in the Union outside the group of civilized peoples, when measured by our care of the health of women employed in manufacture. In the Williams case it was held that a statute establishing a closing hour at night for the work of adult women is unconstitutional.

This occurred in 1907, and in 1906 fourteen enlightened nations of Europe had already agreed through their ambassadors sent for the purpose to Berne, Switzerland, to establish by law a period of rest at night for women in manufacture of not less than eleven hours, within which should fall the time from 10 p. m. to 5 a. m. The nations acted in accordance with this agreement, and by 1910 this was the law throughout Europe. In New York state no pro-

gress in this direction can be made until the decision in the Williams case is reversed and, for this purpose, a closing hour must be established by the legislature and a case arising under it brought before the Court of Appeals.

So paralyzing has been the nation-wide influence of the Williams decision treated as a precedent that, since it was promulgated, no state has adopted a closing hour, although many states have meanwhile established a statutory limit of eight, nine or ten working hours in twenty-four. These laws are, for lack of a closing hour, virtually impossible of enforcement by prosecution.

This significance of the bookbinding trade in New York city, as the occasion of our national position at the rear of the procession of the nations, is not made clear, although the Williams decision is dealt with in Chapter VII and the international agreement of the European nations is briefly mentioned in passing. The book itself loses in weight in consequence. It needlessly appears to be merely a local study of a somewhat localized industry.

These reservations being made, it remains an initial contribution in a field in which such study is urgently needed, and will afford good ammunition for the advocates of protective legislation.

FLORENCE KELLEY.

**THE KALLIKAK FAMILY: A STUDY IN THE HEREDITY OF FEEBLE-MINDEDNESS**

By HENRY HERBERT GODDARD, Ph.D. The Macmillan Company. 121 pp. \$1.50; by mail of *THE SURVEY* \$1.60.

The author of this scientific study in the heredity of feeble-mindedness is the director of the research laboratory of the Training School at Vineland (N. J.) for Feeble-minded Girls and Boys. The Kallikak Family is a genuine story of real people, the names alone being fictitious. The results presented in the book came after two years of constant work, investigating the conditions of this family.

The Kallikak family presents a natural experiment in heredity. A young man of good family living in the days of the American Revolution became, through two different women, the ancestor of two lines of descendants. The one woman, to whom he was not married, was feeble-minded; the other woman, who was his wife, was normal. The line of descendants by his lawful wife was "characterized by thoroughly good, respectable, normal citizenship, with almost no exceptions"; the other line was "equally characterized by mental defect in every generation." This defect was transmitted through the father in the first generation. In later generations more defect was brought in from other families through marriage. In the last generation it was transmitted through the mother, so that we have here all combinations of transmission, which again proves the truly hereditary character of the defect. The investigation shows on the good side of the family "prominent people in all walks of life and nearly all of the 496 descendants owners of land or proprietors. On the bad side we find paupers, criminals, prostitutes, drunkards, and examples of all forms of social pest with which modern society is burdened."

The investigation shows every earmark of the

thorough scientist. The conservatism of the author's deductions is commendable. For example, Dr. Goddard believes that the Mendelian Law applies in cases of feeble-mindedness, but admits that "we do not know that feeble-mindedness is a 'unit character,'" and promises to take up this matter in a larger and later work now in preparation. In the same careful manner, speaking of the practice of sterilizing the unfit, he says: "Probably the most serious difficulty to be overcome before the practice of sterilization in any form could come into general use would be the determining of what persons were proper subjects to be operated upon. This difficulty arises from the fact that we are still ignorant of the exact laws of inheritance. Just how mental characteristics are transmitted from parent to child is not yet definitely known." This should not be taken to mean that the conclusions of the author are negative. They are conservative, but they are positive, and, above all, of tremendous social significance. His study points to not only the hereditary nature of feeble-mindedness, which is "transmitted as surely as any other character," but to the probability of a surprisingly large percentage of feeble-mindedness existing unnoticed in every community, especially of the Moron type, the highest grade of the feeble-minded. (For obvious reasons this type is the greatest source of danger to society.) The most important result of the study to the social worker is the light that it throws on the close causal relation between feeble-mindedness and much of our present poverty, criminality, prostitution and drunkenness. In the words of the author, "feeble-mindedness is largely responsible for these social sores."

"In considering the question of care," it is the opinion of the author that "segregation through colonization seems in the present state of our knowledge to be the ideal and perfectly satisfactory method. Sterilization may be accepted as a makeshift, as a help to solve this problem, because the conditions have become so intolerable. But this must at present be regarded only as a makeshift and temporary, for before it can be extensively practiced, a great deal must be learned about the effects of the operation and about the laws of human inheritance."

FRANK D. WATSON.

**RACE IMPROVEMENT OR EUGENICS**

By LA REINE HELEN BAKER. Dodd, Mead & Company. 137 pp. \$1.00; by mail of *THE SURVEY* \$1.06.

The author of this little book does not leave her reader in any doubt as to the relative value she attaches to heredity and eugenics as opposed to environment and eugenics. "I am a eugenicist because I believe that the nature we have received from heredity sources transcends in effectiveness all the nature which follows birth. . . . We have made a god of environment."

One could wish that in the short sketchy chapters that comprise the book, bearing such comprehensive titles as *Heredity and Environment*, *The Child and Its Heritage*, *Marriage*, etc., enough data were adduced to show that her belief has a basis in science. The greatest fault of the book lies in its dogmatism. The reviewer

appreciates the fact that a short study cannot go into the details of so large a subject, but why a "little book on a great subject"? The book in question not only suffers from lack of comprehensiveness, but seems half baked. We find it difficult to understand the point of view of one who writes:

"We accept the doctrine on which eugenics is based because all the facts confirm it, but we continue to spend our time and money on methods of reform which have lost their root and now only cumber the ground"; and a few pages later states, "it is impossible for any view of eugenics in relation to education to ignore the terrible danger of child labor." The abolition of child labor is part of social reform through legislation looking to "a changed environment" so much belittled by the author. One suspects that much of the muddling of the author's reasoning results from looseness in defining heredity and from a lack of a full realization of the social significance of the newer biology. This seems to be borne out in the fact that the author mentions Lamarck and Weismann in one breath as having "piled instance upon instance to illustrate the fact that 'the sins of the father are visited upon the children unto the third and fourth generations.'" If Weismann's name stands for anything in the history of biologic theory, it is as contrasted with Lamarck, in holding that "acquired characteristics" are not inherited. We regret further occasional evidences of "spread-eagleism," especially in view of the great indebtedness of America to Europe in the realm of biology. Thus, "American eugenisists will never rest until our race becomes the fittest on earth. Other nations shall teach us if they can, we will better their instruction."

FRANK D. WATSON.

#### STUDIES IN THE PSYCHOLOGY OF INTEMPERANCE

By G. E. PARTRIDGE, Ph.D. Sturgis & Walton Company. 275 pages. Price \$1.00; by mail of THE SURVEY \$1.58.

The theme of the book is expressed in the preface when the author says that the main effort for a universal temperance movement must be educational and constructive, rather than legal and negative.

The book is divided into two parts. Part first deals with "the intoxication impulse," and gives in an interesting and sequential way the history of intemperance. The modern view of the physiological and morbid action of alcohol is concisely given, but necessarily in an abbreviated form. A strong plea is made for the systematic use of the "scientific attitude" for the study of intemperance and intoxication. The two concluding chapters of part first are devoted to the psychological theories of the impulse.

Attention is called particularly to the author's negation of the belief that there can be any specific to destroy the craving for alcohol. The writer is in accord with many co-workers when he says that the craving for alcohol is an organized habit with physical elements. He believes that the habit is social in expression, is continued only under the influence of social suggestion, and he questions whether the so-called craving

for alcohol as a physical need really exists. The author's acquiescence with the present view of the transmission of the craving from parent to offspring is psychologically interesting although not conclusive.

Particular mention should be made of the fact that the author does not underestimate the nervous or psychical weakness on which the habit is engrafted.

The second part of the book, comprising forty-seven pages, is given over to the consideration of "the practical problem." In this limited space the author discusses the saloon and the club, and the methods of approaching a solution to the problem of drunkenness. The two concluding chapters on educational measures and the care of the inebriate contain considerable food for thought. The author recognizes the futility of punitive measures, which is clearly shown in the concluding paragraph: "What for example could be more completely wrong than to try to cure the drunkard by punishment and isolation, whose greatest need is a normal social life? It is not to be wondered at that our officials who administer justice almost invariably believe the drunkard incurable."

The book is a popular scientific treatise on an important but imperfectly understood subject. The criticisms that may be made are that insufficient attention is given to the alleged biologic causes for intemperance, and that the author is somewhat dogmatic. The careful reader, however, soon detects that these apparent defects are not really faults, as the book reflects the author's opinions and follows quite closely the modern conception of drunkenness. The writer is cognizant of the need for more concerted investigation of the problems of intemperance and emphasizes the urgency for more specialized study from the different view points of the subject.

IRWIN H. NEFF, M. D.

#### AMERICAN CITY GOVERNMENT: A SURVEY OF NEWER TENDENCIES

By CHARLES A. BEARD, Associate Professor of Politics, Columbia University. The Century Company. 420 pp. Price \$2.00; by mail of THE SURVEY \$2.15.

This volume, as the subtitle indicates, is not a systematic treatise on municipal government, but a survey of recent leading tendencies. The writer lays especial stress on the social and economic functions of city government, rather than on political and administrative matters, to which less than one-third of the space is devoted. The book is a companion to *American Government and Politics* by the same author. The first chapter, *The People of the City*, contains a summary of the survey of the Polish working people at Buffalo, which is selected as a limited American substitute for the exhaustive survey of the wages of the proletariat in London by Charles Booth. Other developments of social significance arising from the remarkable urban growth of this country which are treated in the first chapter are the decrease in home ownership, the employment of women, congestion, and the growth of crime, particularly juvenile crime.

Among the subjects to which entire chapters are devoted and in which social workers are especially interested, are: Guarding the Health of the People, Tenement House Reform, Education and Industrial Training, Municipal Recreation and City Planning. The book is not addressed to professed experts in city affairs, but presents its material in an attractive and interesting way for students and citizens who wish a general survey.
